Why adopt a course which will make inevitable this rôle? Why assume unnecessary risks? Why undertake to furnish ships under a policy that so far from allaying, would provoke trouble, would fail to meet the ends now sought by the victims of a present hysteria, and in other directions will afflict us with new responsibilities, and new burdens. There is no need for haste in this matter. We are not confronted with an emergency which can be solved by immediate action. Nothing that we can do at this time, will correct the abnormalities due to causes beyond our control. The Alexander bill presents the most radical innovation upon our traditional policies, the most unusual application of Federal authority, that has been presented since the Civil War. It commits us to an unknown and untried venture, unaided by the experience of other nations, and substantially, if not avowedly, socialistic. Falling prices, stagnating industries, commercial torpor, interrupted transportation, are grievous evils that invariably cause loose thinking, and are the fertile mothers of many extravagant and undigested plans for relief. The times demand sound thinking, and wise action.

No two advocates of this bill agree on the fullness of its meaning, or the limitations of its scope. Is it, or is it not, an emergency measure? Is it, or is it not, a scheme of permanent Government ownership, and operation? Will it, or will it not, require successive annual appropriations to make effective its purpose, and if so, what approximately is the amount that in the ultimate is proposed to be taken from the Treasury, to put this project finally, and successfully on its feet? Is it, or is it not, to be run at a commercial profit? Are other lines in addition to the lines to South America, contemplated as a part of this scheme, and if so, are these lines like the South American lines, to be run at a loss, and to be turned over to private capital as soon as they begin to be profitable? Is Government ownership desirable, or undesirable? Who is qualified to state the working theory of this measure? All of these queries are differently answered by different champions of the bill. The President advances a theory of limited operation, in his message to Congress, coupled with an intimation that even this operation will be abandoned when the lines projected begin to pay. If this outline of operations fixes the scope of the project, then the expenditure in this direction would not be likely to exceed the amount carried in the bill. On the other hand, the Secretary of the Treasury presents a far more ambitious policy of governmental operation, one that involves transactions on the largest scale, calling for appropriations that in the aggregate may be fairly styled gigantic. At one time the proposition was put forward as an emergency measure. Later it is presented as a permanent policy, one that will overthrow trusts and combinations on the high seas, and afford such a supply of merchant ships, at such moderate and steady rates, as the shipping world has never seen. The House report expressly speaks of the bill as emergency legislation, and deprecates Government ownership in any business that can be conducted as a private enterprise.

The Senate report apparently highly approves of Government ownership, and of a continuing policy of Government activities in this direction. One advocate insists that Government ships can be operated at a handsome profit, and maintains that the forty millions carried in the bill should be regarded as an investment of the first class, disregarding the fact that under the old conditions the impossibility of making a profit on the money invested drove American capital from the use of the American flag. If profit is possible under the new conditions, ample private capital is available to occupy the field and Government ownership is not necessary. Another advocate admits that Government ships, operating at a greater labor cost than their competitors, will be unable to make a profit, but justifies their use on the ground that a losing venture in this direction should be supported by the Public Treasury in consideration of the reduced rates to be afforded to the American shipper. The protagonists of this bill should agree among themselves and present in some consistent and coherent fashion the grounds on which they place this new departure in Government activities, affording at once the scope of its intended operations, its place, whether temporary or otherwise, in the policies of the Government, and a reasonable forecast of its probable cost. The Democrats, at least, who support this measure ought to be able to show not only that economically it is sound, but that it squares with our platform, and is related to some sufficient authority afforded by the Federal Constitution.

Some weeks ago a delegation representing cotton planting in the South, an industry which more than all others has been grievously afflicted by the present war, appeared before the President and asked his interest in behalf of measures designed to secure relief for the interests concerned. He expressed the greatest sympathy with the planters, and avowed his readiness to aid in whatever plans sound finance could suggest to afford relief. But he added that the problem must be solved with the head, not with the heart, and that nothing should be done which was economically unsound or which would rise up hereafter to plague us. May I commend this thought in this connection? Whatever is to be done should be the outcome of grave and sober reflection, a real remedy, not a panacea. I feel assured that a body of such dignity, standing, and experience as your chamber will afford contributions of positive value toward the solution of this problem.

Buying Foreign Ships.

EXTENSION OF REMARKS

OF

HON. J. HAMPTON MOORE,

OF PENNSYLVANIA,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, February 17, 1915,

On the bill (S. 2335) to provide for the register and enrollment of vessels built in foreign countries when such vessels have been wrecked on the coasts of the United States or her possessions or adjacent waters and salved by American citizens and repaired in American shipyards.

Mr. MOORE. Mr. Speaker, as this bill is part of the administration plan to admit foreign ships into the American trade, I desire to discuss it in conjunction with the ship-purchase bill which was rushed through the House yesterday. Except that this bill transfers to the Secretary of Commerce powers heretofore exercised by Congress in the grant of an American register to foreign ships repaired in the United States there is no material change from existing law. In the matter of foreign vessels wrecked by design, the bill is susceptible to certain objections and is also open to criticism because of the ambiguity associated with the words "appraised salved value of the vessel," which the gentleman from Texas [Mr. HARDY] has not yet explained. Whether the value is to be taken before or after the wrecking companies have done their work is not clear, and it is not improbable that the language could be so interpreted that a foreign-built vessel costing $100,000 and being conveniently wrecked, and purchased for a song, could obtain

the American registry and thus enter the coastwise trade for repairs amounting to 75 per cent of the purchase value. It is also possible that foreign vessels of ancient construction and fit only for beaching could be tinkered at sufficiently to meet the requirements of this bill, when no such hulks should be put into commission under any circumstances. The suggestion that the work of repairs must be done in American shipyards is all right so far as it goes, but it is a gratuitous suggestion, since this sort of work would have to be done in American shipyards, anyhow. It is highly improbable that any foreign vessel running on the rocks in Maine or hitting the sand dunes of North Carolina would be taken back to Europe for repairs. Hence the bill offers nothing to American workmen they would not get, anyhow.

NEW SHIPS BETTER THAN OLD HULKS.

On the other hand, every old or battered hulk, originally built by foreign labor, that is patched up for service in the over-seas or coastwise trade removes the opportunity for building one more ship in American shipyards. There is a human as well as an economic side to this question. We ought to have due regard for the lives of passengers and the safety of cargoes as well as for the maintenance of American shipyards. The American workingman would rather build a new ship on the American plan and under American conditions than to rebuild a foreign hulk and permit it to enter into competition with American-built ships in the coastwise trade. We have usually tried to protect the coastwise trade against foreign invasion, but the attitude of the present administration in insisting upon the ship-purchase bill of yesterday and this shipwreck bill of to-day supports the theory, now fairly well grown into practice, that no matter what our advantages in living conditions in this country we are to be forced to compete generally with the conditions and the wages of the old world. I am constrained to believe, therefore, that we do not need this wreckage bill any more than we need the ship-purchase bill which we considered under such high pressure yesterday.

SHIP-PURCHASE BILL UNNECESSARY.

And with reference to the ship-purchase bill, Mr. Speaker, I am reminded that when the gavel fell at the expiration of the 12 minutes allotted to me in general debate yesterday I was in the midst of a statement relating to the alleged congestion at the ports of this country which the Secretary of the Treasury and the Secretary of Commerce were endeavoring to make Congress believe necessitated the expenditure of $30,000,000 for the purchase of foreign ships. I had given some figures showing the tremendous exports of grain from ports other than New York, the New York figures not having been available at the time. That the grain exports were tremendous, and abnormally so, due to the foreign war conditions, was evident from such facts as I was able to get into the RECORD in my 12 minutes. I was about to say when my time expired that on that very day when the records for grain exports were being broken at other ports they had also been broken at the port of Philadelphia, as appeared from the following statement from one of the Philadelphia newspapers:

BREAKS PORT'S GRAIN RECORD—FOUR VESSELS DEPART IN ONE DAY CARRYING 700,000 BUSHELS.

All records for grain cargoes at this port were broken yesterday when four vessels cleared for foreign ports, and carried approximately 700,000 bushels of grain, valued at almost $1,125,000. These vessels were the British steamship *Mackinaw*, for London; the British steamship *Mendip Range*, for Torre Annunziata; the Norwegian steamship *Bjornefjord*, for Helsinborg and Stockholm; and the Italian steamship *Rosalia*, for Venice.

These vessels, with their cargoes and freight and the value of the carriers, would amount to more than $2,500,000. The *Rosalia* had 228,781 bushels of grain, valued at $411,706.10; the *Bjornefjord* had 193,838 bushels of wheat, valued at $290,760; the *Mendip Range* had 262,313 bushels of wheat, valued at $463,312. The amount of grain carried by the *Mackinaw* could not be ascertained, but it was said by responsible parties that it was not less than 50,000 bushels. This is the largest number of vessels that has cleared this port with grain cargoes in recent years.

Confirming this statement from a single port, I am able to present this morning a letter from Mr. Frank L. Neall, a Philadelphia shipping man and statistician, which gives an excellent summary of the week's shipments from the various other ports along the Atlantic Ocean and the Gulf of Mexico. A perusal of this letter and of the statement accompanying it is not convincing proof of the desirability of embarking the Federal Government in the foreign ship-purchasing business at this time:

PHILADELPHIA, *February 16, 1915.*

Hon. J. HAMPTON MOORE,
House of Representatives, Washington D. C.

DEAR MR. MOORE: Vessels chartered to February 13, 1915, so far as made public, that are secured to load full cargoes of grain from Atlantic and Gulf ports:

Inclosed statement shows 112 steamers, with a capacity of 24,000,000 bushels, chartered as above, to load in near future at ports mentioned. In the natural order of things there will be many more vessels probably chartered during the period within which these vessels will load.

Last week the turnover in Baltimore was over 3,600,000 bushels of grain for a single week. That means that the equivalent of almost the entire contents of all of the elevators were emptied into steamers during that week, and at the end of the week there were just as many to load as there were at the beginning of it, and the elevators also were probably as full.

New York shipped about 10,000,000 bushels of grain last week, and, like Baltimore, it doubtless ran the capacity of her elevators to handle the cargoes.

Yours, very truly,

FRANK L. NEALL.

List of vessels chartered to Feb. 13, 1915, so far as made public, to load full cargoes of grain at Atlantic and Gulf ports of the United States. This list embraces vessels not loaded or cleared up to Feb. 9, 1915.

SUMMARY.

Ports.	Vessels.	Quarters.	Bushels.
Portland, Me	4	121,000	968,000
Philadelphia	5	136,000	1,088,000
New York	11	241,000	1,928,000
Baltimore	27	744,000	5,952,000
Newport News	4	161,000	1,288,000
Gulf	29	768,000	6,144,000
"Range"	32	829,000	6,632,000
Total	112	3,000,000	24,000,000

SOME FIGURES SPECIAL TO BALTIMORE.

Since Baltimore has attained a wonderful record as a grain-exporting center, I append the following letter from Mr. Neall, which pertains particularly to that port.

FEBRUARY 13, 1915.

Hon. J. HAMPTON MOORE.

DEAR MR. MOORE: During the entire year 1914 port of Baltimore shipped 156 full-cargo tramp steamers with grain. This year (1915) she shipped from January 1 to February 13, 84 steamer loads; in other words, in 44 days shipped over 50 per cent as much as she did in 365 days in 1914. In 1915 she shipped equal to 2 steamer loads each day, including Sundays. It was the least congestion we know of.

Very truly,

F. L. NEALL.

Mr. Speaker, throughout the discussion yesterday it was patent that the grain growers of the United States were not worrying over the purchase of foreign vessels in which to ship their grain. It developed that they knew that their grain was going abroad in larger quantities and at better prices than ever before. It was also clearly shown, as contended upon this floor a few days ago, that the Treasury Department bugaboo about the farmer paying the freight on these ocean voyages was only intended to encourage the farmer to come in and vote to tax himself to buy foreign ships. It will be recalled that the Secretary of the Treasury and the Secretary of Commerce, in their letter transmitting information concerning ocean freight rates, January 25, 1915, put this proposition up to the farmers in no ambiguous terms. I quote from page 16 of their printed letter, where the Secretaries said:

If the ocean freight cost on December exports had been at the same rate as July, viz, 5.63 per cent, the total freight charge on our exports for December would have been $12,723,800 instead of $30,742,500. In other words, the increased ocean freight tax arbitrarily imposed upon our farmers and business men for the month of December, 1914, only, was $18,018,700. If exports by sea continue for the 12 months of 1915 at the December, 1914, rate, and the ocean freight charges are the same as for December, 1914, the American farmers and business men will pay to shipowners (principally foreign) increased freight charges above the normal rate of $216,224,400, or more than five times the $40,000,000 which the Government proposes by the shipping bill to put into American ships for the protection of our foreign commerce.

FARMERS DO NOT PAY THE FREIGHT.

But the farmers and business men are posted on questions of freight, and since the publication of this letter it has fairly well developed that the buyers on the other side of the water, the speculators as well as the consumers, in England, Germany, France, and other countries, have been paying this enormous freight bill with which the farmers of this country were to be scared.

Arguing their case further, on page 17 of the printed letter, however, the Secretaries referred to make this statement:

To show what the burden imposed on the farmers by these high ocean freight rates means, it is necessary only to bring out the fact that while the total freight cost on our exports by sea for December, 1914, was $30,742,500, the great commodities of grain, cotton, and flour bore $11,782,250 of this charge, or more than 36 per cent of the entire freight cost on all exports by sea for December, 1914.

But even this has not convinced the farmers that it is yet necessary for them to buy foreign ships, since if they do so the burden of expense would be on them directly and the relief would go to those who now pay the freight on the other side. I believe the gentleman from Missouri [Mr. ALEXANDER], who has fought so earnestly for all these shipping bills, and who at first disputed the accuracy of these quotations from the distinguished members of the President's Cabinet, is not now himself

convinced that the alleged high freight rates that prevail because there is a demand for ships to carry contraband at great risk are borne by the producer in the United States.

CABINET OFFICERS DIFFER.

During the rapid-fire debate on the ship-purchase bill and the exceedingly limited debate on this shipwreck bill it has not appeared to the satisfaction of many of us that there is any such necessity for the purchase or repair of foreign ships as the administration and its zealous Cabinet officers insist. Democrats themselves are not happy in their defense of these measures. From almost every angle they are mixed and dubious. The determination of the President to buy foreign ships, even at the expense of an extra session of Congress, can not be based upon any clamorous demands set up by the farmers of the country who raise grain. They are not dissatisfied either with their market, their prices, or the freight rates paid by somebody else. Is it for political reasons the President insists upon the passage of this bill? From the address delivered by Secretary of the Treasury McAdoo before the Commercial Club at Chicago January 9, 1915, the movement to buy foreign ships would not appear to be a political question. Quoting from various party platforms in favor of building up the American merchant marine, Secretary McAdoo said:

These unequivocal declarations show conclusively that the creation of an American merchant marine is not a partisan question, but a vital policy of national importance upon which all parties have long been in agreement.

What Mr. McAdoo said in Chicago was not unlike his nonpartisan statement to the Chamber of Commerce of the United States at its recent meeting in Washington. He thought we ought to keep politics out of it.

Another member of the Cabinet, however, the distinguished Secretary of State, Mr. Bryan, was a little more outspoken than the Secretary of the Treasury, in an address made at Indianapolis on February 4. Reporting Mr. Bryan's speech, the Washington Post of February 5 said:

In referring to the nine Democratic Senators who have broken away from the President, Mr. Bryan said: "I think I know, and I think you know, what the country will think of a Democrat who takes the Republican side on the shipping question.

"If anybody puts in this bill," went on Mr. Bryan, "a word that implies a lack of confidence in the President, let it be a Republican and not a Democrat."

The Secretary of Commerce, Mr. Redfield, who confided to the Chamber of Commerce of the United States that he had been in correspondence with kings and prime ministers of foreign countries who encouraged the happy suggestion that the American Government should buy foreign ships, did not appear to have discussed the political significance of the bill in his address at New Orleans January 29, 1915, but, on the contrary, he is reported to have given notice to the people who own and build ships of American manufacture that the idea was to punish them through the purchase of foreign ships if they did not thoroughly conform to what the administration desired. The newspaper report of the New Orleans incident is as follows:

REDFIELD THREATENS SHIPPING INTERESTS.

NEW ORLEANS, LA., *January 29.*

"If private shipping interests of the United States continue to act unjustly toward the shipper, and they have that power now, we will crush them," declared Secretary Redfield to-day at a luncheon under auspices of the Association of Commerce. He added:

"Steamship officials who have conversed with me regarding the proposal to place Government-owned vessels into operation have been told that Government ships never would be placed in competition with privately owned vessels if the companies will deal squarely with the American people."

Mr. Redfield answered a formal protest against the ship-purchase bill which the association recently sent to Washington.

"UNSOLICITED" INDORSEMENTS FROM NEWSPAPER READERS.

Still, Mr. Speaker, we are without accurate information as to the real underlying cause of the administration's desire to break up the American shipbuilding business by taxing the American people to buy foreign ships. The three Secretaries, so far as their utterances have been quoted, do not seem to agree. We are therefore impelled to return to that interesting Senate Document No. 673, Sixty-third Congress, third session (pt. 2), entitled "Increased Ocean Transportation Rates," wherein we find many letters that have been gathered together by the Secretary of the Treasury and the Secretary of Commerce and their agents to prove that the Government ought to go into the shipbuilding business. Everywhere it is the story of the exporter seeking to furnish the department with information. It is not the producer nor the shipbuilder nor the mechanic nor the man who wants to do a legitimate business in the United States. Frequently it is the man who wants to send contraband to foreign countries in order that he may make money at the expense and risk of the American people. It is remarkable how many of the "exhibits" come up from individuals or concerns who merely "heard" that the departments were seeking information. Take the lumber company which writes from Azalea, N. C., December 29, 1914. It is evident that the letter, which is quite lengthy and covers the point in which the departments are interested, was wholly "unsolicited," for it opens like this:

HON. WILLIAM G. MCADOO,
Secretary of the Treasury, Washington, D. C.

DEAR SIR: Referring to item in New York Herald indicating your desire for information concerning the effect of the present ocean rates upon business would say, etc.

Exhibit No. 30 was from large exporters in New York, as follows:

HON. WILLIAM G. MCADOO,
Secretary of the Treasury, Washington, D. C.

SIR: We noticed by the press that the Government desires information in reference to export rates, etc.

Exhibit No. 31, from Elizabeth, La., January 5, 1915, opened like this:

Mr. WILLIAM G. MCADOO,
Secretary of the Treasury, Washington, D. C.

HONORABLE SIR: We have recently noticed a dispatch in one of the newspapers that you desire information from shippers, etc.

And so in succession the letters, with almost studied regularity, open up with the stereotyped phrase, "We notice in the daily press," or "Our attention has been called to a newspaper article," or "I have recently noticed articles appearing in the papers."

Here and there, however, the cog slipped a little and the writer began like this:

DEAR SIR: I refer to inclosed newspaper clipping, and am glad to see that you will investigate, etc.

Or, as in the case of Exhibit 36:

DEAR SIR: Referring to your request in regard to exporters making statements of overcharges on ocean freight rates to Europe, would say, etc.

BUYING TROUBLE WITH THE SHIPS.

Now, apart from the spontaneity of thought on the part of those who communicated with the Treasury Department because "they saw an item in the newspaper," it is interesting to turn to page 89 of the printed letter, and observe that the exporters were responding to circulars received from the Chief of the Bureau of Interstate and Foreign Commerce, and that, on page 94, Mr. Charles Ferguson, "commercial agent of the Department of Commerce," was indulging an illuminating correspondence with gentlemen in New York and elsewhere concerning the purchase of ships. What Mr. Justus Ruperti, of G. Amsinck & Co., wrote to Mr. Ferguson January 5 is not altogether encouraging to the administration's anxious inquiries.

Says Mr. Ruperti, amongst other things:

I see no great urgent necessity of establishing a Government line to the West Indies, Venezuela, Colombia, and Central America, as sufficient American and neutral steamers are running there at present to fill the most urgent need.

There also seems to be no urgent need for an American line on the west coast of South America at present, since for cargo the merchant line is now under the American flag, and mails are carried by the Peruvian and Chilean steamships from Panama, both of which are under neutral flags.

A line to Italy does not seem necessary, as the Italian Government has sufficient steamers, if only the United States Government will stand together with the Italian to protect these steamers from constant and in many cases unnecessary interference and delay.

For Denmark, Norway, and Holland there is at present also not sufficient freight open, but there should be enough steamers of those countries—which have fleets of their own—to insure a sufficient traffic, if the United States will assist those countries also in maintaining a service which is not unnecessarily hampered and interfered with by the warring nations, as is done at present, where a great many commercial transactions for supplying those neutral countries with their requirements, and which are in no way affected by any articles of contraband of war or supplies for the fighting nations, are hampered and stopped.

Conditions in South America are rapidly improving, and with few exceptions merchants are paying regularly their bills to exporters from this country, according to our experience.

Mr. Ruperti does not throw much hope into the South American situation, as will be observed, but he does indicate that we might buy ships from certain European countries if we would also buy the war conditions. This is a point to be remembered, and it helps to explain why many gentlemen on this side of the House believe that in purchasing foreign ships we are also purchasing trouble.

CENTRAL AMERICAN RATES NOT ADVANCED.

Exhibit 71 presents another interesting letter from Mr. Ruperti. What he says as to the Central and South American situations does not seem to draw any applause from the Cabinet officers, who insist that the farmer pays the freight. In this letter Mr. Ruperti says:

But in regard to the American situation the position is rather curious, as I will explain to you herewith:

All shipments to Central America and Colombia are made by the United Fruit Co. or the Panama Railway Co., which are both now under the American flag, and since the outbreak of the war freights have not been advanced by these lines.

The shipments to Venezuela are made by the Red D Line, also running under the American flag, and these rates have also not been advanced.

Shipments to the west coast of South and Central America are made from Panama by the Pacific Mail and the Peruvian and Chilean lines, also from here direct through the Panama Canal by the Merchants' Line under the American flag. On all these routes the freight rates have not been advanced.

LOOKS TO SOUTH AMERICA, NOT EUROPE.

Mr. H. J. Riedel, of Thomson & Co., New York, submits a letter to Mr. Ferguson, which is marked "Exhibit 72." The part of it I desire to quote is as follows:

I believe there are enough idle steamers at present which the Government could buy, put them under the American flag, and start at the shortest possible time a service which the exporters need so badly. We have a number of able shipping men in New York who are conversant with the South American trade, and under their advice and management a service could be inaugurated within a short period which would certainly be of immense benefit to the future of our export trade. I am not speaking of a steamer service to carry passengers, but solely to carry cargo; and there is no doubt in my mind that it would be easy to buy a sufficient number of suitable boats for that purpose and start with a line for the principal ports, say, Pernambuco, Rio, Santos, Montevideo, and Buenos Aires. The west coast is fairly well covered by steamers under the American flag, and some neutral steamers.

Shipping conditions to Europe are, of course, unsatisfactory on account of England's interference with the free movement of all neutral steamers, and the consequent delay of these boats in English ports has created a shortage of tonnage, which led to a considerable increase in the freight rates. Under ordinary conditions and after peace has been reestablished there are enough steamers to take care of the needs of commerce between here and Europe, but the growing trade to and from Brazil and the River Plata demands better facilities, and I hope that the Government will embrace the present opportunity and help the merchants now to increase the South American trade, a large part of which would surely remain with us after the war, provided sufficient shipping facilities are offered.

MR. BAKER, OF BALTIMORE, ON THE JOB.

But one of the most interesting of all the letters presented by the secretaries is one from Thomas L. Feild, of London, dated December 23, 1914, and addressed to B. N. Baker, Esq., Baltimore, Md., Mr. Baker being one of those operators in ships who has been in consultation with the Washington authorities on the subject of the ship-purchase bill. Mr. Feild tells Mr. Baker of the ships that might be secured and goes into some details. He knows of three ships contracted for before the war that might be had because the contractor failed. Then he tells Mr. Baker that he "hopes we may be able to do some business," but, like many of the other correspondents, he puts it up to the United States to meet the question of neutrality. I quote the latter portion of Mr. Feild's letter to Mr. Baker:

I hope in your letter you will give me some definite information as to what the ships are wanted for.

If they wanted to run from New York to Frisco, I think the Government here could easily be induced to allow them to go under the American flag. While if they are intended for regular tramp business, and possibly to carry cargo to belligerent countries, they might possibly place some difficulties in the way of the builders exporting them to a neutral country. At the same time I believe this difficulty might be overcome.

The possibility of this difficulty, of course, would not arise with either the French or the Greek boats.

I believe I can offer you any available boats to be had, and sincerely hope we may be able to do some business.

THE SECRETARY AND THE COTTON PROBLEM.

Mr. Secretary Redfield, however, helps us out a little in our understanding of the ship-purchase bill in "Exhibit 73," where he asks the Boston Maritime Exchange if it has available any insurable American vessels carrying cotton to Germany or Austria, and indicating that if such a vessel can be had that a charter may be obtained by "communicating with the Texas-Oklahoma Cotton Co., Fort Worth, Tex., immediately." The corresponding secretary of the Boston Maritime Association writing to Secretary Redfield on this and other subjects, states, under date of January 5, that "the Texas-Oklahoma Cotton Co. by wire advised that they could not consider a steamer of size named therein, requiring smaller tonnage, insurance available being limited." "Since writing you yesterday," adds Mr. Freeman, the corresponding secretary, "one of the large steamers named in my memoranda has been closed for Europe from New York, and others are now considering charter here."

STATE DEPARTMENT TO ADVISE PRESIDENT.

It thus appears that the question of neutrality as well as the question of cotton and oil exports is raised in the brief submitted by the Cabinet officers. The neutrality question is evidently deemed of some importance by the Senate committee reporting the shipping bill since, in its report No. 841, Sixty-third Congress, third session, page 21, it gives assurance that there is no special warrant for the fear that in purchasing foreign ships to carry contraband we will in any way involve ourselves with belligerent nations. The committee assures us that we need not worry since "the President will have the State Department to advise him on all questions affecting our right and duties as neutrals."

The neutrality question, however, has been so well discussed by others that I shall not pursue it further. I want to add a few words about cotton and shall then close. Is it because the cotton planter or the oil producer desires to take advantage of the foreign market regardless of war risks that we are to purchase these foreign ships, and depopulate American shipyards? The ordinary normal export business of the country has been of such a nature that the proceeding would seem unwarranted. There has been no congestion of the normal business despite the hurried statements of collectors of the ports, grouped together by the Secretary of the Treasury. The abnormal business, which must necessarily pass away, has been due to war conditions and to speculation based upon the war. We ought not to buy foreign ships and increase the unemployment in the United States to aid speculators in their greed for blood money. The port statistics at Philadelphia for the month of January show that the normal business has not been up to the standard. It is reported from that city that there has been no real difficulty in obtaining ships for the ordinary export trade. I append the month's statistics so that they may speak for themselves.

NORMAL EXPORT TRADE GIVES NO CONCERN.

PHILADELPHIA, PA., *February 2, 1915.*

To the President and Members of the Board of Commissioners of Navigation for the River Delaware and its Navigable Tributaries.

GENTLEMEN: The arrivals and departures of vessels during January show a decrease in numbers and in tonnage compared with the same month last year. Exports of wheat, flour, naphtha, and fuel oil exceeded those of January, 1914.

The wheat exports for January were 2,807,513 bushels, as against 2,442,010 bushels for the same month last year. Flour shipments totaled 23,018,911 pounds, compared with 19,336,840 pounds for January, 1914. In the shipment of naphtha a gain of 3,718,733 gallons is shown, the total exports footing up to 3,735,860 gallons, as against 7,127 for the same month last year. The fuel oil exports totaled 3,580,308 gallons compared with 2,108,590 gallons for January, 1914.

The arrivals from foreign and coastwise ports during January were 383 vessels with a tonnage of 683,606 compared with 408 vessels and a tonnage of 805,574 for January, 1914. The sailings were 392 vessels with a tonnage of 686,214, as against 439 vessels with a tonnage of 833,810 for the same month last year.

Respectfully submitted.

A. F. RENNER, *Statistician.*

HELPING THE FOREIGNER; INJURING THE AMERICAN.

As to the cotton business, the facts are also against the foreign ship purchase proposition. To begin with, the cotton crop was abnormally large. In the second place, exports of cotton have increased enormously and the shipments to foreign countries are being made with wonderful regularity considering the unusual conditions that prevail. The report of the Director of the Census for the month of January sets forth some figures that demand our serious consideration from the American viewpoint. Despite the demand to use American money for the purchase of foreign ships to carry American cotton abroad, we exported in January, 1915, in the teeth of the foreign war, more than 300,000 bales in excess of the exports of January, 1914. The exact figures given by the Director of the Census for this month, when the agitation for ship purchase has been at its very height, are as follows:

Cotton exported January, 1914	1,052,272
Cotton exported January, 1915	1,372,175

Why should anyone insist upon spending $30,000,000 of the people's money now, when the people are hard up and need it, to give employment to foreign shipbuilders to carry American cotton abroad when we are already carrying more cotton abroad than we did last year when there was no war? It does not seem fair nor seem wise, nor is it just to the pepole who are entitled to earn a decent living on this side of the water. They are entitled to have their own money spent at home.

Even in these war times we have been sending more cotton abroad than we sent last year, and while that has been going on we have been using less cotton in the manufactories of the United States because we did not have the work to give to our own people. We have suffered fearfully from foreign competition in cotton manufactures, because of the low wages paid on the other side of the water and because of the still lower wages that will be paid to the European victims of the great war. The same Director of the Census who gives us the January figures on cotton exports also tells us in the same report that the number of cotton spindles active in the United States during January has been reduced by nearly 500,000. In January, 1914, there were 31,098,176 spindles employed and in January, 1915, the number fell to 30,565,479.

This is no political claptrap; this is the report of the sworn officer of the Government, showing conclusively that while we are sending abroad more cotton than ever for the workmen there to fabricate and send back to us in competition with our own products we are actually cutting down our own opportunities for employment in the United States. The Public Ledger

of February 16 reports that 12 hosiery mills in Philadelphia either liquidated or failed last year. The reason for that is the low tariff and the insistence upon opening the American market to foreign competition. We have done it in the matter of textiles, as the great lines of unemployed in the big cities attest. We ought not to do it in the matter of ships and shipyards, and I trust that we will not.

In conclusion, I append an editorial from the Philadelphia Record, a Democratic newspaper, which knows the situation in Pennsylvania and which differs from the administration on the ship-purchase bill. This is from the issue of February 11:

While the Secretary of the Treasury is feeding Congressmen on tales of congested ports, whence our products can not go abroad for lack of vessels, the heartless exports go on leaving the country in unprecedented amounts. In the first week of February the exports from 13 districts were close to $60,000,000, which is at the rate of over three billions a year, while our exports have never reached two and a half billions. The cotton exports for the week were 365,733 bales, or at the rate of about 19,000,000 bales a year, far more than we ever produced. The excess of the value of exports over imports was more than $37,000,000, and in 10 weeks the exports have amounted to more than half a billion dollars and the balance in our favor was $275,000,000. The importance of more ships seems to have been slightly exaggerated.

Speech of Hon. Julius Kahn.

EXTENSION OF REMARKS

OF

HON. WILLIS J. HULINGS,

OF PENNSYLVANIA,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, February 17, 1915.

Mr. HULINGS. Mr. Speaker, under the leave granted to me to extend my remarks in the RECORD I include the speech of Hon. JULIUS KAHN at Arlington, February 15, 1915, on the occasion of the anniversary of the sinking of the *Maine*.

The speech is as follows:

"REMEMBER THE 'MAINE.'"

Seventeen years ago to-day the men who "sleep the sleep that knows no waking" within these hallowed grounds, were basking in the bright sunshine under the tropical sky that hangs over the beautiful harbor of the "Pearl of the Antilles." All unconscious of the dreadful doom that hovered so near they felt perfectly secure beneath the peaceful folds of Old Glory, floating proudly to the breeze in Cuba's historic bay of Habana. Most of them were in the very flush of young manhood, full of the vigor of life—the present without a seeming care, the future radiant with bright hope. The day's work had been faithfully performed. The vigilant officers, the tired sailors and marines had gradually retired to rest, until finally the tread of the men on watch and the occasionally muffled utterance of the password were the only sounds that disturbed the thorough stillness of the night.

And then, without a moment's warning, without a single premonitory sound, there came a roar from the deep—a terrific explosion that awoke the drowsy citizen from his slumber, the while the good ship *Maine*, of Uncle Sam's proud "White Squadron," for a brief period pitched and lurched and tugged at her anchors, and then slowly sank beneath the engulfing wave.

In that one moment our country, which steadily had been cultivating the arts of peace for a full third of a century, was lashed into a passion of rage and hatred that could not be assuaged except through blood atonement. The precious lives so ruthlessly destroyed on that fateful night of February 15, 1898, demanded vengeance. Once assured that the explosion had occurred on the outside, millions of our countrymen refused longer to be held in leash. "Remember the *Maine*" was the angry cry that roared from the parched, excited throats of teeming masses in every community in the United States. It became a slogan that increased in bitterness and vindictiveness as the weeks rolled on. For a brief period of time the President was able to hold in check the excited throngs in their violent demand for war. But he was powerless to stem the rising tide. Recalling here and now the rapidly moving incidents of those days, is anyone so fatuous as to believe it would have been possible to submit the questions growing out of that terrible calamity to the International Court of Arbitration at The Hague if such a court had existed at that time?

The American people felt their flag had been fired upon without provocation, their citizens wantonly killed, their national honor violently assailed, and they promptly did that which has always been done by strong, virile nations in every period of the world's history—they prepared for war. Fellow citizens, we are too prone to forget the lessons of the past. We are too apt to overlook the fact that painful incidents that have occurred once in our country's history may on some future occasion be repeated. No matter how peaceful our intentions, no matter how little we may desire war, we are not alone the arbiters of the destiny of these United States. We all hope we may never again become embroiled in war; but if the citizens of any country with which we are at peace should willfully and in a spirit of resentment at some fancied grievance blow up and destroy an American ship and bring death to its officers, crew, and passengers I would be loath to guarantee continued peace between the aggressors and ourselves. And I am led to this belief because in my study of the world's progress I have learned that human nature is practically the same to-day as it has been at all times since the dawn of recorded history. The veneer of civilization has not materially altered human emotions, human passions. These have existed ever since mankind were created, and they will continue to exist until the last syllable of recorded time. Love, hate, forgiveness, vengeance, envy, jealousy, thrift, greed, kindness, liberality have always found a lodgment in the human heart, and when they shall have been entirely and finally eradicated from the breast of man the human race will have become extinct. And so long as these human emotions exist, so long as they continue to actuate man in the deeds he performs, so long will we have wars upon this turbulent old world of ours.

A nation, after all, is but a mighty aggregation of individuals, and all the failings, all the shortcomings, all the mistakes of the individual are simply multiplied, and therefore accentuated, in the national life. When municipalities shall be able to disband their police forces by reason of the discontinuance of crime, when the suppression of crime shall no longer require the expenditure of large sums of the taxpayers' money for the protection of the lives and property of the peaceful, law-abiding citizen, then, and not till then, will the nations of the earth agree to the complete disarmament of their land and naval forces.

In the meantime what is our patriotic duty? It seems to me there is but one answer, and that is that we must be constantly prepared to defend ourselves. I believe that to be the true path of wisdom, the true path of patriotism, the true path of duty. Anything short of that, in my judgment, is criminal carelessness. I do not believe in militarism. I do not believe in military conscripton. I do not believe it is necessary to maintain a standing army of half a million men or anything like that number in these United States. But I do believe we ought to encourage military training in our schools, in our academies, our colleges, our universities. I believe in the maintenance and extension of summer camps, where our growing youths can be taught and drilled in the rudiments of military training. Such a training will teach them initiative, self-reliance, sanitation, physical culture, obedience to command, endurance, and self-denial—qualities of inestimable value as they proceed onward in their life's work.

I believe in a short enlistment period, so that many thousands of young men could be honorably discharged from the military service to the peaceful pursuits of civil life every year. We are to-day hopelessly deficient in an adequate and necessary reserve force. Our first efforts should be directed toward the establishment of such a force, from which we could fill our regiments and muster them at full war strength immediately upon the outbreak of hostilities. I believe in the construction and maintenance of the necessary number of batteries of field artillery and a goodly supply of reserve ammunition therefor. I believe in reserve stores of small arms and their ammunition, medical supplies, clothing, and field equipment generally. If we follow as a fixed policy even a conservative course in procuring these essential requisites for military preparedness, we will never again have to pay the frightful penalties in the toll of human lives and the enormous expenditure of precious treasure that our unpreparedness in our past wars have cost us.

I believe also in a strong Navy. We must not permit ourselves to embark on such a niggardly policy of naval construction that we may run the risk of losing control of the sea in case any enemy might attack us. Even now we are learning the lesson of what it means to a nation to lose such control. This splendid country of ours, with all its great, natural resources, with rich and opulent communities on our seaboard, would have to pay the cost of many battleships and dreadnaughts in the material losses that would come to us once the control of the sea is taken away from us. It seems to me that proposition is so self-evident that I marvel at the hardihood of the men who would endanger such control by refusing to appropriate the nec-

essary funds in order that we might enlarge our Navy gradually but effectively year by year.

To my mind the two most dangerous elements against our peace and well-being in this country to-day are those well-meaning but altruistic citizens whose bombastic utterances as to our military prowess constantly have a tendency to lull our people into a sense of fancied security and those others who delude themselves into the comforting belief that the millenium has already dawned. To assert that we can raise and equip a million men over night to fight our country's battles against the trained hosts of any great military power, to assert that a regiment of sharpshooters can stand upon the seashore and pick off possible invaders as they approach the unprotected land, regardless and unmindful of the fact that the dreadnaughts of the invaders would hurl enormous shells that would undoubtedly drive our sharpshooters to the woods pell-mell and in double-quick order, is to show such a lack of knowledge of conditions under which modern military operations are conducted that no man who is not enarmored of the sound of his own voice would be guilty of making such irresponsible and mischievous assertions.

To assert that disarmament will bring peace and that when we shall have abolished our standing Army and dismantled our forts and our Navy we will be in no danger of possible attack, is to become totally deaf to the teachings of history; yea, to the lessons of nature itself. All living creatures are constantly at war with each other. The wild beasts of the forest, the birds of the air, the fish of the sea; aye, even the crawling, creeping reptiles are constantly preying upon one another. It is their natural instinct. They are created that way. And man himself is but a civilized animal.

My friends, the Spanish-American War brought us great and grave responsibilities. When once a country becomes involved in war the Omnipotent Father alone can foretell what will be the ultimate consequences. Therefore we should always be slow to enter into a quarrel with any nation. We should never be the aggressors. But if ever we shall be attacked by any power on earth we must be ready and able to defend our hearths, our homes, and our country against the emboldened enemy. And we can only make an effective defense in safeguarding all that we hold most dear, by following the sage advise, based upon his personal experiences of our first great President, the immortal Washington, "In time of peace prepare for war."

Ship-Purchase Bill.

EXTENSION OF REMARKS
OF
HON. CHARLES F. CURRY,
OF CALIFORNIA,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, February 16, 1915,

On the bill (S. 5259) to establish one or more United States Navy mail lines between the United States and South America and between the United States and the countries of Europe.

Mr. CURRY. Mr. Speaker, I am opposed to this bill. It is inexpedient, untimely, unnecessary, dangerous, and contrary to the fundamental principles of our Government.

The time allowed by the rule to discuss this very important measure does not permit of debate. It hardly gives time enough in which to make statements and does not allow sufficient time in which to present arguments against it.

The special political power and business pressure behind this bill is the desire to increase the price of cotton and mainfain the price of wheat and the further desire of some large exporters and importers to obtain from the Government cheaper freight rates than conditions warrant.

Those who are advocating this measure seem not to understand the immutable laws of supply and demand.

The moment European cotton mills are regularly supplied with all the cotton they can use the price of cotton will go down, and as soon as America sends Europe all of the wheat needed to feed her people the bottom will drop out of wheat and the price will go down to normal.

If big shippers are given freight rates by the Government at less than cost, the people will have to foot the bills.

The only action needed to rehabilitate the American merchant marine is to defeat this measure, reenact the marine laws that were on our statute books prior to 1815, providing for preferential duties on goods carried in American bottoms, and change our commercial treaties with a number of foreign nations, which we can do by giving a year's notice, or pay a subsidy where and when necessary and give the preference to our own ships in carrying the mails, as other maritime nations do.

When Mr. Wilson was a candidate for the Presidency he strenuously opposed committees of Congress preparing legislation behind closed doors and was violently opposed to secret party caucuses, and yet this bill could not pass this House if it were not being put through under a rule, the secret action of the Democratic members of the committee, and the whip of the caucus pledge.

The business of government is to govern, and not primarily to engage in private business enterprise that brings it into competition with its own citizens.

The engaging of Government in private business is justifiable and right when the enterprise can be better conducted by the Government for the benefit of all of its citizens than it can be conducted by private enterprise and in conditions of emergency.

The entering of the Government into the shipping business at this time can not be justified on either hypothesis, and during the continuance of the European war it will endanger the peace of our country. To provide big business with cheap freight rates the Government will conduct the shipping business at a loss and run the risk of becoming involved in war.

If I owned a ship carrying contraband or conditional contraband or was attempting to run a blockade and it should be captured and taken into a prize court by a belligerent, our citizens as a whole would not become unduly exercised over the incident. They would say that I was knowingly taking those chances, and the State Department would see that I received justice. But if a Government ship was so treated, it would set the people on fire.

What do you think would have happened if the *Wilhelmina* had been owned by the Government when she and her cargo were detained by a British cruiser? Would the people be so calmly waiting for an adjustment of the case by the State Department? The seizure of the cargo of the *Wilhelmina* by England may be justifiable or it may not. The people will trust the State Department to settle that question through diplomatic methods, as she is privately owned. The question would be much more serious if she were a Government-owned ship.

Congress is a unit behind President Wilson in his patriotic determination to maintain our neutrality in the European conflict, but he does not seem to realize that if this bill is enacted it will embroil us in diplomatic complications, if nothing worse, and it would just as likely cause us trouble with Germany as with the allies, as, on account of mines and blockades, we would not be able to send as many shiploads of supplies and provisions to Germany as we would to the allies. Should we buy and attempt to use the interned ships of a belligerent, it would be certain to cause us trouble.

The Government will not be able to make the shipping business pay and does not expect to. Instead of granting a subsidy to the ships it intends to give it to the shippers. It will not materially benefit the farmer, but it will benefit the big shippers of grain, steel, automobiles, and other commodities by giving them low freight rates at the expense of the taxpayers. There is no shortage of vessels on which to ship our goods at the present time, and no emergency exists that would justify the enactment of this bill on that ground. If an emergency did exist, this bill would not grant immediate relief without it is the intention of the Government to buy interned ships, as it takes a year or more to construct a large steel vessel fit for use in the transoceanic trade. The purchase and use of interned ships by the Government would be a violation of neutrality, the same as it would be if they were bought and used by private citizens. I am opposed to the Government or private citizens being permitted to buy foreign ships and transfer their registry.

The February issue of the New York Marine News gave a list of 60 American built and officered vessels formerly engaged in the coastwise trade that have crossed the Atlantic loaded with American grain and goods since the commencement of the war in Europe; but no vessel whose registry was transferred from a foreign flag to the American flag under the ship-registry act has entered the trans-Atlantic trade, with the exception of Standard Oil boats carrying oil and the *Dacia* that recently sailed from Galveston, Tex., by the way of Norfolk, Va., loaded with a cargo of cotton, and she is liable to seizure.

A number of ships available for the trans-Atlantic service are tied up and out of commission at San Francisco. If the occasion should arise, they could be officered by American citizens and brought to this coast for use in the trans-Atlantic trade.

I quote the following from the February, 1915, issue of the New York Marine News:

THE USE OF AMERICAN STEAMERS IN TRANSATLANTIC TRADE.

One of the inspiring features of the shipping situation is the increasing use of American steamers formerly employed in the coastwise trades to make trans-Atlantic voyages. The successful voyages made by some

of these vessels clearly repudiate the oft-repeated assertions that the American mercantile marine must always be decadent, because of the lack of American officers and masters to make up the complement of such vessels. The feat of Capt. Pinchin, of the Southern Pacific steamer *El Monte*, in passing through the mined channels of Bremen without the aid of a licensed pilot is but characteristic of the training of American seamen. When it is taken into consideration that a majority of the American vessels now crossing the Atlantic were never intended for the deep-sea trade, the fact that so far not an incident of serious import has transpired places the American seaman not only on a par with the vaunted ability of the foreigners, but clearly confirms the theory that seamen capable of guiding vessels through our coastwise voyages, where currents make perfect navigation essential, can guide their vessels on trans-Atlantic voyages without difficulty.

The demand for American steamers to enter the German cotton trade showed no signs of diminishing through the month of January. Insurance underwriters were kept busy in passing on applications to allow coastwise vessels to make trans-Atlantic voyages. Prospective shippers of cotton to Germany, finding the Atlantic coast lines were unwilling to withdraw any more of their vessels from regular service, have now turned their attention to the Pacific coast, and during the latter part of January several Pacific coast steamers were either chartered or sold to come to the Atlantic to load cargoes of cotton to Germany.

SIXTY AMERICAN VESSELS USED.

The following list of American steamers that have made trans-Atlantic voyages since the beginning of the war is striking, in that it shows that the American mercantile marine even in its present limited status possesses elasticity:

City of Macon, City of Savannah, George E. Warren, L. V. Stoddard, Edward Pierce, Cacique, Evelyn, Pass of Balamaha (ship), *Camino, Gulflight, Kansan, Nebraskan, Pleaides, El Monte, El Paso, Antilles, Carib, Santiago, Neches, Antilla, Matanzas, Pathfinder, A. A. Raven, Robert M. Thompson, Southerner, Dochra, Suruga, Carolyn, Powhattan, City of Memphis, City of Columbus, George Hawley, Newton, Pacific, Curaca, Wilhelmina, Vincent* (ship). *Navajo, Missourian, Nevadan, Herman Frasch. J. L. Luckenbach, El Mar, Creole, El Siglo, Navahoe, Denver, Medina, Bayamo, Massapequa, Berwind, Ruby, Greenbrier, Georgiana, Satsuma, Kanawha, Kentra,* and *Westwego.*

There does not seem to be a lack of vessels to carry our products to Europe, but the freights are high, due in part to the war risk and in part to the fact that the European harbors are crowded and ships have to wait their turn to unload, usually two weeks, sometimes as long as 30 days, and on account of lack of cargo they return to America loaded light or in ballast, also because England and France have requisitioned a number of steamers recently for temporary transport service.

If it were not for the agitation caused by the President's insistence on the passage of a bill providing for a Government-owned merchant marine, there is no doubt in my mind but that every shipyard in the country would be working overtime building ships to be used in trade by private citizens.

Can you imagine any Democratic President, or, for that matter, any President or candidate for the Presidency, with the exception of Socialists, from the beginning of the Government, advocating this bill, with the further exception of Secretary of State Bryan, and he, while he is an able gentleman and a plausable advocate of his policies, is more of a Populist, Socialist, and Prohibitionist than he is a Democrat.

I doubt if President Wilson, had he been elected to Congress instead of to the Presidency, would advocate this measure.

Section 8, page 8, line 6 to line 14 of the bill, would authorize the shipping board to make the rules and regulations for lighthouses, the Geodetic Survey, and the Quarantine Service as applied to shipping.

Section 8, page 8, line 15 to line 3 on page 9 of the bill, does away with the rules and regulations of the Steamboat-Inspection Service and of the Bureau of Navigation, and also provides the machinery to create an absolute Government monopoly by forcing by special rule of the shipping board any private-owned ship off from a run in competition with a Government ship.

If the bill is to pass, it should be amended on page 9, section 9, line 15 of the bill, by adding, after the word "provided," the words "but the master and watch officers of such vessels and on all merchant vessels of the United States, including pilots, shall be citizens of the United States."

Certainly Government ships ought to be officered by American citizens.

If the Government is to engage in the international ocean carrying trade, the ships should be officered by Americans and operated under the Navy Department, as our Navy officers are trained in international law and diplomacy, and they might be able to keep the ships from violating neutrality and save the country from its humiliating consequences. At least, they would not, through ignorance or design, embroil us in an unjustifiable war.

Should this crude, illy considered, and involved bill be enacted into law, I do not suppose anyone is so foolish as to imagine for one minute that any private capital will be invested in the purchase of the minority stock.

The British Board of Trade has a way to force English manufacturers, exporters, and importers to subscribe for minority stock in privately owned vessels and to make their investments permanent. Such required investment is based on the volume of trade of the individual firm or corporation, as the case may be.

No English business man dare refuse to make such investment when requested. If he should, he would be punished by not being allowed to ship his goods. He would find that every vessel on which he attempted to make a shipment had a full cargo.

On January 19 of this year the Washington Times published an article explaining the English method of building up, developing, and perpetuating their merchant marine. From that article I have gathered and present the following account of their system:

Subsidies or subventions are paid to certain classes of their ships, and private investments in merchant vessels are made permanent. All British merchant ships are divided into 64 equal shares. The ownership of 33 shares absolutely control her. The managing owners hold the 33 shares, which represent control. The rest are distributed among investors, and the investors in the minority shares are practically compelled to buy them.

Exporters, importers, and manufacturers are requested to subscribe for the minority shares, and in order to insure the shipment of their goods at reasonable rates they find it to their advantage to do so. It enables them to import and export their goods at reasonable freight rates and insures a market and a profit on their merchandise.

The managing owner, under his contract, receives 2 per cent of the gross freight earnings plus the earnings on his 33 shares, which gives him a large return. The average minority owner rarely receives over 2 per cent on his investment in the ship.

The managing owners always write into their contracts a provision that if a ship should be lost and the insurance collected, that the insurance money shall at once be reinvested in a new vessel. It is never distributed to the shareholders.

When a new ship is turned out from a British yard it is registered at Lloyd's as "A* 1* 100," the highest index designation. It sails under that designation for 10 years and is insured, with its cargo, on the most favorable terms. After 10 years its rating is "A* 100," and its insurance rates are higher. When the vessel, after years of use, can not get so good a rating of insurance, it is sold and transferred to some foreign flag, and the money is reinvested in a new ship. It might be a good idea to adopt that system in this country, but I do not think the administration intends to attempt to put it in operation through the machinery of this bill and substitute the United States shipping board for the British managing owners.

Why President Wilson is Losing His Grip on the Party.

EXTENSION OF REMARKS

OF

HON. JAMES C. McLAUGHLIN,

OF MICHIGAN,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, February 17, 1915.

Mr. McLAUGHLIN. Mr. Speaker, the New York American, Saturday, February 13, 1915, published the following interview with Senator WILLIAM ALDEN SMITH, of Michigan:

WHY PRESIDENT WILSON IS LOSING HIS GRIP ON THE PARTY—THE MILITANT SENATOR FROM MICHIGAN GIVES THE REPUBLICAN VIEW OF THE PRESENT CRISIS IN CONGRESS AND COUNTRY.

[By John Temple Graves.]

WASHINGTON, *February 12.*

During the feverish stir that followed the Republican filibuster on the shipping bill I met Senator WILLIAM ALDEN SMITH pacing the corridor in triumph.

"Sir," said I to that bold and able Republican Senator, "your party gives new evidence of the remarkable facility for getting together after division. How is it?"

To which the slashing filibuster, fresh from the laurels of his 11-hour speech, made answer in the following statement bristling with points and luminous in its forecast of the Republican line of attack in 1916:

"Our party is cohesive because our Presidents have been willing to discuss public questions with the public men of the country and with citizens in private life. This has been conspicuously true of our most successful Chief Executives.

"The difficulty with President Wilson, in my opinion, and I say it with all kindness, is his unwillingness to counsel with his party chieftains or with Senators and Representatives who are clothed with governmental responsibility under the Constitution. He will not discuss public questions. He has not delivered a single state paper in which he has discussed the subject matter upon which he desires legislation. Every message he has delivered, from his inaugural address to the present time, has been dictum, dictum, dictum.

"He assembled Congress in extraordinary session to revise the tariff, and did not argue a single phase of our fiscal policy. He simply said what he wanted done.

"He did not argue the Mexican question. He directed his spleen squarely and solely at one citizen—Huerta—against whom he seemed to have acquired animosity.

"He did not argue the Panama tolls matter. He simply said that he would not know how to handle other problems if Congress did not

reverse itself upon that issue; and he expected such specimens of Democratic consistency as Speaker CLARK and Leader UNDERWOOD to immediately reverse themselves upon that doctrine.

"He has never shed any light upon the intricacies of banking and currency legislation, and, whether he knows anything about it or not, his followers are left in the dark.

"He has not argued the ship-purchase bill, although it marks a radical departure from the settled policy of our Government for 125 years, and his party now seems to be split wide upon it, and against which the country is practically united.

"He has not discussed in detail any great measure for which he has stood. The only time since he took the oath of office as President of the United States that he has entered into a discussion of public questions was in his speech at Indianapolis a few days ago, which was a most partisan harangue from the first line to the last and does no credit to the presidential office.

"That is the reason he can not succeed, and the country is fast becoming convinced that scholastic training and experience in the schoolroom do not necessarily fit a man to meet the grave responsibilities of a Government like ours. I think he is the most intense partisan I have ever seen in the White House, and I served in Congress through Grover Cleveland's administration and every other President since. He draws himself into a shell and is inaccessible to the people. I know of scores of delegations from different parts of the country who have come to this Capital to see him and warn him against errors which he was about to commit, and they have left here without an audience; and the President has been deprived of the practical advice and common sense of men who came with a real message, worthy of his attention.

"He brought Nelson O'Shaughnessy from Mexico City to Washington after months of service of the most delicate, painstaking, and courageous character in Mexico. He kept him toasting his heels in his room in a hotel here for 10 days before he would give him an audience, and even then it is thought by many that he did not even ask him for information.

"A political party that goes to sea without a rudder, compass, or chart will find itself sooner or later upon the shoals, reefs, and rocks. No one man knows it all. The loved Lincoln, even when he was borne down by the heat and burden of the day, did not foreclose himself against even humble citizens, and it is related by those who knew him best that he learned something from every one.

"President McKinley, in the trying years of the Spanish-American War, never closed his door against a public man or a private citizen. The presidential office should never be converted into a cloistered study. Books may contain history, but authors do not usually make history. Men make history, but an amanuensis can take it down.

"I think President Wilson is bound to fail in meeting the expectations of his countrymen, because he is trying to run the Government alone, when there are scores and scores of noble Democrats in the public service and many disinterested Republicans from whom he might learn if he were but willing to hear.

"Every measure he has been instrumental in placing on the statute books at the point of the bayonet is an experiment and a failure thus far. While he has failed utterly to grasp either the cause or the remedy of the conditions of anarchy throughout Mexico, he has been instrumental in giving arms and ammunition to bandits and revolutionary chieftains until, with our guns and our powder, one Mexican President after another has been shot into and out of the presidential office in rapid succession.

"The European estimate of our duty under the Monroe doctrine must have changed miserably during the past two years, while the Governments of Central and South America have lost confidence in our disinterested attitude toward them."

* * * * * * *

Senator SMITH'S criticisms are given point and emphasis by the astonishment which the friends of the shipping bill feel over the fact that President Wilson said not one word about the shipping bill before the great National Chamber of Commerce last week.

The comment is that before this greatest and most impartial of American commercial bodies, about to pass by resolutions upon this most important commercial question concerning the country to-day, the President gave not one reason or said not one word about the great issue upon which he is holding back all the appropriation bills of the country, and for the sake of which he is making likely an extra session of the Sixty-fourth Congress when the country is sick and tired of legislation.

The opinion is expressed that an argument by the President would have caused the body to pass a favorable resolution instead of the unfavorable resolution which passed.

Mining Experiment and Mine Safety Stations.

EXTENSION OF REMARKS
OF
HON. JOSEPH HOWELL,
OF UTAH,

IN THE HOUSE OF REPRESENTATIVES,

Monday, February 1, 1915.

On the bill (H. R. 15869) to provide for the establishment and maintenance of mining experiment and mine safety stations for making investigations and disseminating information among employees in mining, quarrying, metallurgical, and other mineral industries, and for other purposes.

Mr. HOWELL. Mr. Speaker, the general sentiment in the House in favor of this measure will be hailed with the utmost satisfaction by the mining industry throughout the country. Congress has been slow in responding to the just demands of the mining industry. The appalling loss of life from time to time in coal mines and the serious impairment of health incident to mining and associated industries were so strongly impressed upon Congress that finally, after repeated and persistent effort, the Bureau of Mines was created. In the short time since its establishment it has certainly vindicated the arguments urged in favor of its creation.

From the first, despite the delays incident to assembling the necessary experts and the lack of means for adequate and sufficient equipment and facilities, the work of the bureau has been so favorably impressed upon the country that its future growth and usefulness is fully assured. No one can read the reports of its activities without appreciating the vital importance of its functions and without discerning the immense field of usefulness that lies before it. True to the paramount idea in the public mind at the time it was organized, the bureau has led in the "safety first" campaign in the mining and other mineral industries. It has sought to obtain the cooperation of State and other agencies seeking to increase safety and efficiency in those industries, and has been instrumental in bringing about changes in mining methods and in methods of treating minerals that have tended to reduce the death rate from accidents and have saved to the public mineral resources that might otherwise have been wasted—resources valued at many millions of dollars.

Some of the bureau's achievements that I consider particularly worthy of notice I will briefly mention. To describe the manifold activities of the bureau and to set forth in detail its great work for humanity is a task I do not undertake. The chairman of the Committee on Mines and Mining, in his report on the bill that has now been passed, pointed out the purposes of the bureau, its needs, its achievements, and the reasons why the Government should extend to the mining industries aid proportionate to the importance of these industries in the upbuilding of manufactures and commerce. I will not repeat what he has said, but, as a representative of a State having vast mineral resources, I am deeply interested in the efforts of the Bureau of Mines to increase safety and efficiency in mining, and especially in its efforts to aid in a greater development of the mineral industries in the public-land States. And it is with pride that I call attention to the fact that the State I have the honor to represent is now conducting, in cooperation with the bureau, investigations looking to a larger development and more efficient utilization of the mineral resources of the State.

In the mine safety investigations of the bureau attention thus far has been devoted largely to the question of coal-mine explosions. Different grades of coal dust collected from hundreds of mines in different coal fields have been carefully studied with reference to their explosibility and the starting of dust explosions by the use of improper explosives or from miners' lamps or mine fires. Experiments with different preventive measures during the past year are resulting in the development of practical and efficient devices for preventing or stopping explosions.

The bureau has already brought about what is little short of a revolution in coal mining through the introduction of new types of explosives, far safer than black powder or dynamite, for use in gaseous or dusty mines. Of these explosives, designated permissible explosives, more than 25,000,000 pounds was used in the more dangerous mines of the country during 1913.

The bureau is also developing "permissible" safety appliances for use in all branches of the mining, metallurgical, and other mineral industries, which, as their use is enforced by State inspectors, can not fail to largely decrease fatal and other accidents.

The bureau has not only brought about many improvements in electric installations in mines but is also aiding in the introduction of miners' electric safety lamps, which will make the miners' work safer and easier.

Through mine rescue cars and stations now in operation the bureau is training the miners in different parts of the country in rescue methods and in giving first aid to the injured, giving aid after disasters, and carrying forward an educational campaign for greater safety in all branches of the mining industry. Already over 25,000 miners have been trained by the bureau, nearly 100 miners have been rescued by bureau employees, and a much larger number have been rescued by other miners who have received the bureau's training.

The bureau now operates eight mine rescue cars, each of which travels from one mining district to another, training miners and giving instruction in rescue, first aid, and general safety methods. It also operates five mine rescue stations in different coal fields.

Other safety work by the bureau includes investigations of accidents from falls of roof and from caving-in mines, the lack or the failure of safety appliances, and the accidents or the injury to health from the use of improper explosives and the improper use of explosives in metal mines, quarries, and tunnels.

The economic importance of the work for accident prevention is evident; during the past year more than 3,000 men were killed and 100,000 injured in our mining and metallurgical

industries, and it is estimated that one-half of the deaths and three-fourths of the injuries may be regarded as easily preventable. The money loss from these accidents may be estimated at not less than $12,000,000 for the year, and this loss is ultimately paid by the consumers of mineral products.

The work of the States in carrying out their part of this general program in mine safety is being carried forward in a reasonably satisfactory manner. The States are already expending in their inspection and police supervision work more than the Federal Government is expending in all its investigations in behalf of mine safety. So far as it goes, this educational work is assuredly developing safer and better mining, and the leaders among the miners express the belief that if carried forward on a larger scale and in a more thorough manner the work can not fail to develop also better citizenship among the miners. The following excerpts from a communication received from the Salt Lake Mining Exchange are worthy of consideration:

There are located within the boundaries of the several public-land States large bodies of low-grade ores of different types for the efficient treatment of which there are no known methods. There are other large deposits that are being worked in accordance with methods that are highly wasteful of valuable mineral products. On the public lands in these States there are many mineral deposits concerning the value of which little is at present known. These and other associated problems, general in character, will be investigated by the several mining experiment stations to be established in such regions, and it is obvious that the results of such investigations will be not only beneficial to the industry, but also to the general public.

Mining is usually regarded as an industry made up mainly of the operation of a few large, profitable properties, such as the old Comstock mines in Nevada, the Treadwell mine in Alaska, the Utah copper properties in Utah, or the Homestake mine in South Dakota. It is usually considered to be an industry controlled by a few parties, the owners of which large properties would gladly avail themselves of an opportunity to unload on the National Government the cost of conducting researches in which they are particularly interested. Therefore it is usually considered as an industry which should be allowed, and even required, to take care of itself. These assumptions are far from correct.

The facts of the situation are: These large, profitable properties are few in number; that, so far as known, their owners have never joined in a request for Government appropriations to aid the mining industry, nor have they been given any special consideration either in the establishment or in the plans of the Bureau of Mines. They have neither asked for assistance, nor have they endeavored to unload upon the Government any investigations of their own. On the contrary, at the request of the Bureau of Mines, a number of them have expended considerable allotments of their own funds on investigations which promise to be useful not only to them, but to other less important mining developments in which they were in no way involved.

While the number of large mines in this country is small, there is a large number of small mines. The records show that in the country as a whole there are about 40,000 coal mines, metal mines, and quarries and about 170,000 oil wells, operated to a smaller or larger extent in connection with the mining operations. In addition to these there is a large number of operating plants connected with the smelting and other metallurgical operations and various mineral industry operations in different parts of the country. Few seem to appreciate the importance of helping those who hold these small properties to find methods of operation by which they can be worked at a profit instead of being helplessly transferred to a few large corporations who alone may have the funds for developing the processes that will make such operations possible.

Congress is now appropriating as an aid to agricultural advancement nearly $28,000,000 per annum, while mining is receiving through the Bureau of Mines and the United States Geological Survey less than $2,000,000.

The per capita contribution from the people of the United States for the advancement of agriculture amounts to 28 cents and for mining 2 cents.

In referring to the aid given agriculture and mining by the Federal Government, Franklin K. Lane, Secretary of the Interior Department, recently said: "For a number of years Congress has been appropriating annually for the maintenance of experiment stations in behalf of agriculture in the several States an aggregate sum of nearly $1,500,000. In addition to this, in the public-land States the Federal Government has expended during the past 12 years $77,150,180 in the reclamation work of making available additional agricultural lands, and of this sum more than $8,000,000 has come from the proceeds of the sale of mineral lands in the public-land States."

I mention these expenditures with no feeling other than that of approval, but in passing I may call attention to the fact that the mining industry in this country does not appear to have had a square deal in the way of public recognition and aid. And in speaking of mining, tunneling, quarrying, metallurgical, and other mineral-industry plants, it is impossible to estimate the number of men with health shattered through these conditions, who have had to give up their work before their natural time or the number of dependents who have suffered thereby.

In one of the best-known metal-mining districts of the United States, in addition to the number of men killed by accident, in the year 1912 there were 720 deaths from miner's consumption out of about 7,200 employed—10 per cent in one year. Ten years of such conditions wipes out an important mining camp. This almost unbelievable condition has apparently existed for many years, with the loss of hundreds and hundreds of men. It is also stated that at the present time from 30 to 60 per cent of the miners employed in mining operations in this district now have tuberculosis.

In the face of this condition, as we know that miner's consumption is an occupational disease caused by stone dust in the mines and largely preventable, it is imperative upon the Government to do its utmost to investigate the causes of this disgraceful condition and to improve the working conditions and to obviate, as far as human intelligence may be able, the dangers to life, limb, and health which now exist in that indispensable industry.

Preliminary investigations of health conditions in mining and other mineral industries, undertaken by the Bureau of Mines in cooperation with the Public Health Service, are yielding notable results. One of these investigations, that of health conditions in lead and zinc mines, is focusing the attention of local health authorities and of State officials on the excessively high death rate from tuberculosis in at least one important mining district and is showing that this excessive death rate is largely due to the inhalation of fine, sharp particles of rock dust made by drilling and blasting.

In its investigations looking to the lessening of present wastes or losses of mineral resources and the development of more efficient methods, the bureau has given attention chiefly to the waste from smelters and other metallurgical plants, the waste in the treatment of the rarer minerals and metals, the waste in coal mining, and the waste in the production of oil and natural gas.

In investigating the coking of coals in beehive ovens the bureau found that $75,000,000 worth of by-products is being lost annually. As a result the bureau has undertaken a study of industrial carbonization processes looking to the recovery of these wasted by-products and is preparing for publication a complete report of the notable advances made.

The importance of the bureau's investigations of mineral waste is further shown by the fact that these wastes or losses in our mineral resources, of which the Nation has only the one supply, now exceed $1,000,000 per day and yet are believed to be largely preventable.

In its investigations of fuels the bureau developed the new methods upon which the Government fuel purchases are now made, and has thus brought about savings in the Government's fuel bill that amount to hundreds of thousands of dollars. During 1914 over $8,000,000 worth of coal was purchased for the Government under specifications prepared by the Bureau of Mines, or under its advice, and as a result of these fuel investigations the Government saved more than $200,000 as compared with prices paid in previous years. Other work by the bureau has served as a basis for boiler improvements in public buildings and the development of a new type of power-plant boiler.

We need not especially concern ourselves about the profits of the few large mining companies. There are many thousand small mine owners and prospectors struggling with difficult problems, there are the safety and welfare of the 2,000,000 employees in the various mining and mineral industries, and there are the other great national problems of waste in these industries, all of which should have our serious concern and should have also the benefit of extended national inquiry and scientific investigation.

As I have stated, during the first two years of its existence practically all of the appropriations for the work of the Bureau of Mines have been spent in behalf of the coal-mining industry, mainly in the Mississippi Valley and the Eastern States. This work has been so satisfactory as to justify the effort of those who favor this legislation and to win the approval of many of those who originally opposed the creation of this bureau.

In view of the great coal-mine disasters of the last few years the representatives of the metalliferous-mining industry recognized the propriety of making the prevention of these disasters the first great work of the bureau. This work is now well organized, and the recognition and aid of the Federal Government in behalf of the metal-mining industry of the West should not be longer delayed.

For the past 15 years the mining men of the Western States have been demanding Federal recognition and aid in behalf of the mining industry. With the help of representatives of the coal-mining regions the agency through which this aid can be given was finally secured, and its work should now be extended to the metal mines of the public-land States. The organization of mine-safety work in the metal-mining districts has not been entered upon, but is greatly needed. The loss of lives in many of these districts is almost as great as in the coal mines.

For some years past the metalliferous-mining industry of the West has not kept pace with the development of other lines of enterprise. Under the stimulating effect of Federal aid given through the Department of Agriculture the average annual valuations of agricultural production of the public-land States has increased from an annual value of $966,000,000 during the five years from 1901 to 1905 to an average annual valuation of $1,365,000,000 for the five years preceding 1910. During those same years the average production of precious metals from those States has decreased from $136,000,000 during the first period to $127,000,000 during the second period. With rare exceptions the population of all the mining camps in the West

decreased during this period and in many instances low-grade mining camps have been entirely abandoned.

The achievement of the bureau's chemists and engineers in perfecting new methods for the extraction of radium has been brought to the attention of this House by the gentlemen from Illinois, who recently exhibited $11,000 worth of radium made by these methods. Steps have been taken to patent and dedicate to the public these processes, which show 15 per cent higher efficiency than that obtained by the largest foreign producer of radium, and promise to reduce the cost of radium to one-third of the present price.

In this line of research work, in my judgment, will be found one of the most valuable and legitimate provinces for its activities. What has been accomplished toward improving the method of reducing radium-bearing ores will, when promulgated, tremendously stimulate private enterprise in the production of radium, to the end that an adequate supply of this marvelous, mysterious, and benevolent element may be available for the people. What the bureau has so successfully achieved with this elusive mineral furnishes conclusive evidence of what may be realized in the treatment of other mineral-bearing ores. The field is fallow and awaiting such investigation and research work as this bureau must be permitted to engage in.

The safety and health of millions of toilers in mines and attendant industries will always be the paramount consideration. But, in addition to this, the bureau, without impairing its functions in this respect, should be provided with adequate equipment and facilities to conduct research work in respect to the economic and scientific development of our metal-mining resources, with the object of devising improved methods in mining and of avoiding waste and fruitless effort.

The discovery of gold in the shining sands of California by Mormons employed by Capt. James W. Marshall in digging a mill race in the mountains of Coloma in 1847 brought a rush of Argonauts from all parts of the world to the new Eldorado. From that time to the present a great deal has been done in the development of precious metal mining.

This has been accomplished by the hard common sense, pluck, and force of the courageous men who have engaged in the industry; but the time has come when this industry should be fostered and encouraged by disseminating the information to be secured by scientific research work under the Bureau of Mines. This bill provides ultimately for the establishment of 10 mining experiment stations and 15 mine safety stations, movable or stationary, including those already established, the province and duty of which shall be to make investigations and disseminate information with a view to improving conditions in the mining, quarrying, metallurgical, and other mineral industries, safeguarding life among employees, preventing unnecessary waste of resources, and otherwise contributing to the advancement of these resources; and, when its purposes have been carried out, the beneficial results will verify all we predict.

For several years an earnest effort has been made by the Members from the precious metal producing States to have the Bureau of Mines extend its activities by the establishment of mining experiment and mine safety stations at various places in that vast region. I have had a bill before the committee ever since the Bureau of Mines was organized to establish such a station at Salt Lake City. In the hearings before that committee, on December 18, 1911, I made the following statement, which I think is pertinent at this time to the bill under consideration:

STATEMENT OF HON. JOSEPH HOWELL, OF UTAH.

Mr. HOWELL. Mr. Chairman and gentlemen of the committee, H. R. 11853, which I have introduced, presents the same principle as that so ably discussed by Mr. Taylor. Salt Lake City is another suitor for a mining experiment station. This city is so situated in the heart of the great metalliferous mining region of the West and possesses other features of advantage for the location of such a station unequaled by any other place. But my chief purpose this morning, Mr. Chairman, is to urge an extension of the work of the Bureau of Mines, so as to include in the scope of its usefulness technologic investigations in metallurgy and a study of metalliferous mining. The mining States for many years have been knocking at the doors of Congress for the establishment of a department of mines, but not until they secured the cooperation of the coal-mining interest of the East were they enabled to make much headway. Finally, after a persistent effort the Bureau of Mines was created. This was hailed with a great deal of satisfaction by those engaged in precious-metal mining as an evidence that the great mining industry was about to receive the fostering attention of the Government that it deserved as one of the great basic industries on which rests the welfare and prosperity of our people. There were those in the beginning that opposed the Department of Agriculture and sneered at the futility of the General Government's activities in this respect, but time has abundantly proven the wisdom of the far-sighted statesmen who advocated the promotion of agriculture by the General Government.

The Department of Agriculture has grown to be indispensable to the country. Its beneficial work, like a candle set upon a hill, shines upon the whole country. In the light of what has been accomplished for agriculture we can confidently look forward to like achievements in the field of mining—its twin sister. These two industries are the source of all that we require for the welfare of mankind. Why should not the mining industry receive the same encouragement at the hands of the General Government as agriculture? The Bureau of Mines in the inception of its mission has confined its efforts largely to the coal-mining industry, and has done most excellent and praiseworthy work in that field. The horrible catastrophies constantly happening in coal mines have stirred the whole people and caused a demand on the part of the Government to put forth every possible effort to avert a recurrence of these calamities in the future and toward improving the conditions affecting the health and safety of the miners. But the time has come that the metalliferous miners demand some attention to their industry. Here is a field lying fallow for scientific research and investigation. The mining of precious metals in our country is in its infancy. Only the richest and most tractable ores have been made to yield their treasure. Millions of dollars of ore have been taken from mines and thrown aside, because no known process permitted their reduction at a profit. Other millions of tons of ore lie undisturbed in our mountain vaults for want of knowledge to profitably extract their values. Then there is the problem of controlling the poisonous fumes that issue from the smelters and destroy all vegetable growth in the vicinity and provoke never-ending bitter legal controversies to burden our courts. Scientific and economic experimentation along these lines are entirely beyond the reach of private investigation. This can be properly and adequately undertaken only by the General Government. What a field for effort. How pregnant of possibilities for the enrichment of the Nation. What an aim for the conservationist in utilizing to the highest degree our unborn wealth.

Now, Mr. Chairman, the metalliferous mining States are keenly alive to the necessities of the situation, and everywhere there is a strong and widespread demand for the inauguration of a policy that will advance and promote this industry. The mining congress, composed of able representatives of all the mining States, unanimously adopted the following resolutions:

"Whereas the development of processes of ore treatment capable of handling with profit the vast low-grade deposits and mine dumps of our mining districts is of the greatest importance to the mining industry and to all related industries: Be it

"Resolved, That it be the sense of the American Mining Congress that the Congress of the United States be, and is hereby, memorialized to provide for the establishment, under the direction of the Bureau of Mines, of a metallurgical experiment ore-testing station or stations for the purpose of devising methods for the extraction of metals from low-grade ores and appropriate sufficient funds for such purpose.

"Resolved further, That the officers of the American Mining Congress draft a suitable bill providing for the proper carrying out of this resolution, and that copies of the bill and of this resolution be forwarded to the President of the United States and each Senator and Representative; and that the officers of the American Mining Congress use all honorable means to the end that such a bill may become a law. In view of the increasing importance and complexity of the mining and metallurgical industries, the deplorable waste in mining under present methods, and the great need of trained men to aid in improving these conditions and in developing greater safety and efficiency.

"Be it resolved, That the American Mining Congress, now in session at Chicago, urges the Congress of the United States at Washington to provide for aid and cooperation in the maintenance of mining schools in the several States in a manner analogous to that which has been done in behalf of agriculture.

"Be it resolved, That the members of the American Mining Congress and the friends of the mining industry throughout the country are hereby urged to cooperate in securing the proper legislation necessary to carry above purposes into effect."

John Dern, a distinguished citizen of Utah, and one of our leading mining proprietors, president of the last mining congress, delivered an able and instructive address at that congress. His remarks upon the Bureau of Mines are so pertinent and set forth so clearly and convincingly the claims of the precious-metal industry that I insert the following excerpt from him:

THE BUREAU OF MINES.

"The American Mining Congress for years demanded the creation of a Department of Mines and Mining in our National Government, with representation in the President's Cabinet. Due directly to the efforts of our organization, Congress finally created a Bureau of Mines. That our efforts were successful was due to the support of the distinguished guest who is to honor us by his presence during our present session and whose wisdom, high-mindedness, and sincerity of purpose we all acknowledge and applaud—President William Howard Taft.

"Congress created the Bureau of Mines, but the usefulness of the bureau has so far been circumscribed within very narrow limits. It is true that it has been permitted to do some extremely valuable work to lessen the number of accidents in coal mines, but aside from that its chief work has been to test fuel for the Government, so that when Uncle Sam wants a load of coal for the Capitol at Washington or for one of his battleships he will get his money's worth. No doubt this is a necessary and important function, but we are not satisfied with this amount of aid for the mining industry.

"One of the important tasks before us is to create a demand that the Bureau of Mines be given a chance to do some of the things that we expected of it. Give it a chance and have no fear that it will not quickly justify itself. If we can convince our Congressmen and Senators that the Bureau of Mines ought to have the authority and the appropriation it asks for, our able and good friend, Dr. Holmes, and his assistants will promptly demonstrate that the money could not have been better spent.

"We believe that the Bureau of Mines ought to be to the miner what the Department of Agriculture is to the farmer. When the Department of Agriculture was created, it was the object of much criticism, and yet it is now one of the most important factors in our national life and nobody wants it abolished. I am an ardent admirer of the Department of Agriculture and of the work that it is doing. So far as tangible results are concerned, I believe it is the most useful branch of our Government. It tells the farmer how to maintain the fertility of his soil by rotating crops; when and how to plow his land; what sort of crops to raise and how to get the highest yields; how to irrigate his land if it does not rain enough, and how to drain it if it rains too much.

"If these great things are done for agriculture, why not do something for agriculture's sister—mining? Be it remembered that man's every need is supplied by our mother earth. Out of the earth's crust comes everything we drink, eat, wear, or use, all our habitations, conveyances, tools, and, in fact, everything we have, be it necessity or luxury. Agriculture and mining are the twin sciences that divide between themselves the work of extracting these things from the earth. Agriculture has the vegetable kingdom and mining the mineral kingdom.

Is there any reason why agriculture should be made the favorite child of our Government, while mining is treated as a stepchild? The two sciences are of equal importance, and neither could exist without the other. We are not in the least jealous of the treatment that has been accorded to agriculture. She merits it all and more. We only plead that mining be likewise recognized and given her just dues. To those who argue that agriculture is the more important, we say, 'Pause and reflect whether any sort of civilization could be possible without the products of the mines.' It is undoubtedly true that no mining or any other sort of work could be done without agriculture, but agriculture alone is helpless to advance the human family in its onward march toward higher and better things."

Now, gentlemen, Mr. Taylor and myself and the other representatives of the West are of one accord in our efforts to extend the scope and work of the Bureau of Mines to cover its legitimate field of usefulness. These bills have been introduced as a step in this direction. If it is determined that one or more mining experiment stations is the most effective way to accomplish the desired result, I know of no other city in the country that possesses the same strategic points of advantage for such a station as Salt Lake City. The commercial club, consisting of the business and mining men of Salt Lake City, has had the matter before them for consideration and have adopted the following resolutions:

[Report of commercial club's committee on mines and mining adopted at the general membership meeting of the commercial club, December 22, 1911.]

"Whereas the American Mining Congress at its last annual session passed a resolution asking the Congress of the United States to enlarge the scope of the United States Bureau of Mines by establishing under its auspices metallurgical research stations, thus affording the mining industry the same encouragement and treatment at the hands of the General Government as is given the agricultural industry, and that an appropriation sufficient to carry out the enlarged functions of the United States Bureau of Mines be made;

"Whereas the present activity of the bureau is confined to the coal-mining industry, and should be equally devoted to the advancement of the metal-mining interests;

"Whereas Salt Lake City is the center of activity of the mining and smelting industry of the United States: Therefore be it

"*Resolved*, That the Salt Lake Commercial Club, by its assembled membership, give its indorsement to the general idea of the establishment of Government metallurgical research stations: Be it further

"*Resolved*, That the Congress of the United States be, and is hereby, memorialized to appropriate for the use of the Bureau of Mines the sum of $500,000 for such experimental purposes and that it enact a law providing for the establishment of such metallurgical research station at Salt Lake City, Utah: Be it further

"*Resolved*, That a copy of this resolution be forwarded to Senator REED SMOOT, Senator GEORGE SUTHERLAND, and Congressman JOSEPH HOWELL for presentation to Congress, and that these members of the Utah congressional delegation be earnestly urged to use all energetic and honorable means to bring about the aforesaid results: Be it further

"*Resolved*, That a committee of two be appointed by the board of governors of the commercial club to bring this resolution to the attention of individual Representatives in Congress and use all honorable means to procure legislation necessary to bring about the purposes of this resolution."

Salt Lake City is the commercial center and metropolis of that vast territory between the Rocky Mountains and the Pacific Coast Range. It is in the very heart of the mining region. It is also a great railway center, with two continental railways—the Union Pacific and the Rio Grande—from the east, and three from the Pacific coast—the Southern Pacific, the Western Pacific, and the Los Angeles & Salt Lake Railway—while the Oregon Short Line connects the city with the States to the north and northwest. These main lines of railway, centering in Salt Lake, have feeders or branch lines ramifying the entire mining region and bring all the most important districts in direct and close connection with Salt Lake City. In a radius of less than a hundred miles are found all the leading mining districts in Utah, in which are found a variety of ores, containing gold, silver, copper, lead, zinc, etc., typical of the ores of a vast mining region.

The State university is located here, which embraces an excellent school of mines, so that from every standpoint Salt Lake is the ideal place for conducting these investigations. In proposing this legislation I realize that we are breaking new ground, and the committee in its wisdom may determine upon some other method of reaching the object desired. I am sure the State school of mines at Salt Lake City would be most willing to cooperate with the Bureau of Mines in this work. I fully sympathize with the views of our chairman in favor of granting Federal aid for mining schools in the several States. This is in line with what has been done for agriculture, and I want to see the Bureau of Mines stand as the head in the new awakening to better, more scientific, and more economical methods of mining.

Ship-Purchase Bill.

EXTENSION OF REMARKS

OF

HON. ROBERT N. PAGE,

OF NORTH CAROLINA,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, February 17, 1915,

On the bill (S. 5259) to establish one or more United States Navy mail lines between the United States and South America and between the United States and the countries of Europe.

Mr. PAGE of North Carolina. Mr. Speaker, when a Representative in the discharge of his official duties finds himself out of harmony with a majority of his party colleagues upon any matter of legislation, naturally enough, if he is conscientious, an effort is made to harmonize his views with those of his party associates and, if unable to do so, vindicate his position.

During the second session of the present Congress a bill was introduced in the House of Representatives, now publicly known as the shipping bill. It was understood then and now that this measure had the approval of President Wilson. By the provisions of this bill the Government of the United States was authorized to purchase and operate merchant vessels on the high seas. I believe firmly in the long-established policy of the Democratic Party touching a merchant marine, stated in the platform adopted at Baltimore in 1912 under the head of "Merchant marine," as follows:

MERCHANT MARINE.

We believe in fostering by constitutional regulation of commerce the growth of a merchant marine, which shall develop and strengthen the commercial ties which bind us to our sister Republics of the south, but without imposing additional burdens upon the people and without bounties or subsidies from the Public Treasury.

This declaration of party principle is emphatic and unequivocal, and there can be no misinterpretation of the language "but without imposing additional burdens upon the people and without bounties or subsidies from the Public Treasury." By the provisions of the shipping bill above referred to $40,000,000 was to be appropriated for the purchase or construction of these vessels; $30,000,000 of this amount to be raised from the sale of Panama Canal bonds, and $10,000,000 by appropriation from the National Treasury. No one will deny that this constitutes an additional burden upon the people. The Democratic Party having never declared in favor of Government ownership and operation of public utilities and being thoroughly convinced then as now that the Government can not operate these things either as efficiently or as economically as private enterprise, I could not gain the consent of my mind to support this legislation, and it was so announced in the public prints of my State.

Upon the convening of the present session of Congress on December 8, 1914, the President in his annual message urged upon the Congress the enactment into law of the shipping bill, basing his request upon the opportunity presented for the expansion of American commerce because of conditions brought about in the commerce of the world by the European war. In that message Mr. Wilson made it perfectly clear that it was the purpose of the proponents of this legislation to make it temporary, using this language:

It should take action to make it certain that transportation at reasonable rates will be promptly provided, even where the carriage is not at first profitable, and then, when the carriage has become sufficiently profitable to attract and engage private capital and engage it in abundance, the Government ought to withdraw.

My own opinion is that the Government can not enter into any field of endeavor without necessarily monopolizing that field. The sentence quoted above makes it clear that it is the purpose, should this bill become a law, to operate these vessels at a loss. This necessarily precludes competition on the part of private capital, which can not operate without profit. A merchant marine capable of performing the service required of it in the handling of American commerce would require the investment not of $40,000,000 but not less than $400,000,000. The bill now under consideration is not the original bill but a consolidation of Senate bill No. 5259, introduced into the Senate by Senator WEEKS, of Massachusetts, and entitled "An act to establish one or more United States Navy mail lines between the United States and South America and between the United States and the countries of Europe." This bill, in brief, provides that the Secretary of the Navy shall establish one or more mail lines by employing such vessels of the Government as may be available between the United States and both coasts of South America and between the United States and the countries of Europe, to be operated under such regulations and at such rates as the Secretary of the Navy may prescribe. It also authorizes an increase of the enlisted strength of the Navy by the number of men required to man the vessels so employed, giving these new employees the same privileges of retirement as officers of the line.

This bill appropriated the modest sum of $100,000 for the purpose of organizing, inaugurating, and carrying on the traffic provided for in the bill, with the further provision that all moneys received for the transportation of mail, passengers, and freight shall be made available, in addition to the appropriation of $100,000, for the expenses incident to the proper conduct of the business contemplated—together with House resolution 732, better known as the Gore bill, which provides for the creation of a shipping board, its incorporation in the District of Columbia for the purpose of purchasing, constructing, equipping, maintaining, and operating merchant vessels to meet the requirements of the foreign commerce of the United States or

to charter vessels for such purposes. The initial capital stock of this corporation is fixed at $10,000,000; a provision is made for the selling of $40,000,000 of Panama Canal bonds in addition to this appropriation. These vessels are limited by the terms of the bill to engagement only in trade with foreign countries, the Philippine and Hawaiian Islands, and the island of Porto Rico. This provision precludes the participation of these vessels in the coastwise trade of the United States. It also provides that two years from and after the conclusion of the present European war, that fact to be determined by the President, the corporation and the shipping board shall turn over and transfer all vessels purchased or constructed under the provisions of this act to the Navy Department, and the Secretary of the Navy shall have the right, with the approval of the President, to lease or charter any of such vessels not needed for naval or military purposes to any firm, individual, or corporation for use as merchant vessels. It also provides that at this time the corporation shall go out of business and the merchant marine of the United States shall thereafter be operated by the Secretary of the Navy under the terms of Senate bill 5259, known as the Weeks bill.

If enacted into law, is this bill by its terms in conflict with the party platform adopted at Baltimore in 1912, that states in specific terms that the Democratic Party in fostering a merchant marine will do so without imposing additional burdens upon the people and without bounties and subsidies from the Public Treasury? I think no one will deny that it is in direct contravention of this party declaration.

I yield to no man in my admiration for the President of the United States. I believe by training and in mental equipment he is the equal of any man who ever held this high office. I have great confidence in his judgment and unbounded admiration for his personality, but I can not subject, without investigation, to his judgment my own convictions upon the questions involved in this legislation. If it was a mere opinion, I would relinquish it gladly to be in accord with him and with a majority of my party associates; but having an abiding conviction, based upon what I believe to be the long-established principles of the Democratic Party, that have been greatly strengthened and confirmed by the utterances of Mr. Wilson himself, I can not support this bill without surrendering my self-respect as well as prostituting my obligation to the constituency that has so signally honored me.

Going back to 1912, when the question of the Panama Canal tolls was before the House of Representatives and the question was acute as to whether or not vessels engaged in the coastwise trade of the United States should be exempt from tolls in passing through the canal, I then favored and voted for the collection of tolls from vessels engaged in the coastwise trade, for two reasons: First, because, in my judgment, the treaty that enabled us to construct the Panama Canal prohibited us from giving this preference to our own vessels; and, second, because the vessels engaged in the coastwise trade of the United States are, by our laws, made practically a monopoly, and to exempt them from the payment of tolls would be, if not a direct, certainly an indirect subsidy to the owners of these vessels. A majority of the Congress took a different view, and these vessels were at that time given free passage through the canal. This action on the part of our Government was considered by every foreign power as being a violation of the solemn obligations we had entered into by treaty; and the situation was so acute that the President felt impelled on March 5, 1914, to deliver a special message to the Congress upon this subject, and in this message he frankly asked the Congress to repeal the provision of the Panama Canal act of August 24, 1912, which exempted vessels engaged in the coastwise trade of the United States from the payment of tolls. In that message he said:

> Whatever may be our own differences of opinion concerning this much-debated measure, its meaning is not debated outside the United States. Everywhere else the language of the treaty is given but one interpretation, and that interpretation precludes the exemption I am asking you to repeal.

Again:

> We ought to reverse our action without asking the question whether we were right or wrong, and so once more deserve our reputation for generosity and for the redemption of every obligation without quibble or hesitation.

During the discussion in the Congress of the bill to repeal the Panama Canal act of August 24, 1912, the President, in his periodical talks with newspaper correspondents in the city of Washington, as published in the World's Work of October, 1914, in discussing with them the measure pending in the House of Representatives, made reference to the plank in the Democratic platform of 1912 which, in specific terms, favored the exemption from tolls of American ships engaged in coastwise trade passing through the canal, and he is quoted as having said:

> If you will examine the platform you will find that there are two planks in it, one directly, as all other declarations of a party have been, against subsidies, direct or indirect, or any additional burden laid upon the people for the sake of encouraging shipping; and the other is with regard to tolls. Now, it ought not to be difficult to determine which should take precedence—a long-established principle of a party or what now seems to be an exception from the long-established practice. That is perfectly plain sailing, to my mind; I don't see any escape from it. Free tolls certainly is a subsidy, and as between the principle of the party and a policy which violates that immemorial principle there ought not to be much difficulty in choosing.

Applying this reasoning to the shipping bill, by the terms of which the Government is to place a tax of from thirty to fifty millions of dollars upon the people to engage in over-sea commerce, and comparing this with the long-established policy of the party, as expressed in its platform quoted above, I can not escape the conclusion that it is perfectly plain sailing for me; I can not see any escape from it, and in supporting this bill I should unquestionably violate the long-established policy of our party, as well as a specific platform declaration.

Referring again to legislation enacted during the last session of Congress, namely, the bill that authorized the Government of the United States to construct and operate a railroad in the Territory of Alaska and appropriating therefor the sum of $35,000,000 was, to my mind, so serious a departure from long-established Democratic doctrine and precedent, and though indorsed by the President and a majority of my party associates, I could not support it. Certainly no platform of the Democratic Party in the past has directly or by implication committed the party, or myself as a member of that party, to the legislation now pending.

Party policy can only be inaugurated in one way, and that is by a direct declaration of principles in the party platform. If it is a matter of State interest and control, then the State platform, and if of national importance, then in the national platform.

As the representative of the people of the seventh congressional district of North Carolina, and in my representative capacity, even in the absence of a platform declaration, should they, my constituents, by any means inform me of their desire touching any proposed legislation I should consider myself bound to carry out their wishes or resign my seat in the Congress of the United States. As long ago as October, 1914, as I said in the beginning, the newspapers of my State published the fact of my opposition to this bill. Five months, very nearly, have elapsed since my position upon this question was known to my constituents. It was not discussed in the campaign of 1914 there or elsewhere. There has been no declaration by the party touching the question, and it is a very significant fact that in all these five months I have not received a single request from any constituent, either orally or by written communication, asking me to support this legislation. Some one may say that the action of a party caucus establishes party principles, but upon serious reflection I am sure that no one will so contend.

Only recently, namely, on the 28th day of January, 1915, the President delivered to the House of Representatives a message vetoing an act to regulate the immigration of aliens to and the residence of aliens in the United States, a bill that had been passed by a vote of two-thirds of the Representatives voting in the House of Representatives, and seven-tenths of the vote in the United States Senate, and in doing so he used this language:

> If the people of this country have made up their minds to limit the number of immigrants by arbitrary tests, and so reverse the policy of all the generations of Americans that have gone before them, it is their right to do so. I am their servant and have no license to stand in their way. But I do not believe that they have. I respectfully submit that no one can quote their mandate to that effect. Has any political party ever avowed a policy of restriction in this fundamental matter, gone to the country on it, and been commissioned to control legislation? Does this bill rest upon the conscious and universal assent and desire of the American people? I doubt it. It is because I doubt it that I make bold to dissent from it. I am willing to abide by the verdict, but not until it has been rendered. Let the platforms of parties speak out upon this policy and the people pronounce their wish. The matter is too fundamental to be settled otherwise.

If the matter of the regulation of the admission of aliens to our shores is a matter of such fundamental importance, is not the policy of embarking the Government upon the unknown and untried seas of Government ownership a question of fundamental importance? Is it not one of such vast and far-reaching importance that before this step is taken the people should be given an opportunity to assert their wish? Does this bill now under consideration rest upon the conscious and universal assent and desire of the American people? If it has the assent or is fostered by the desire of the constituency that I represent, that

constituency has signally failed to assert its wish. Has any political party in this country, other than the Socialist Party, ever avowed a policy of Government ownership? I respectfully submit that no one can quote their mandate to that effect. It is because I doubt that it is the desire or the wish of any considerable number of people among my constituency or within the Democratic Party to embark upon this doubtful and losing enterprise that I make bold to dissent from it.

If in the usual way the Democratic Party expresses as its mind and desire that we embark upon the practically untried and unknown sea of Government ownership and operation, reversing the policy of all the generations of Americans that have gone before them, it is their right to do so. I am, so far as the constituency that I represent is concerned, their servant and have no license to stand in their way. I am willing to abide by their verdict, but not until it has been rendered.

One other phase of this subject, and I am done. The disturbances of commerce and trade brought on by the terrific war precipitated in Europe on the 1st of last August has so deranged the revenues of our Government that it became necessary at the last session of Congress to levy a special tax upon the people in order that a hundred million dollars might be raised in taxes to supplement the loss occasioned by the falling off of imports. The Government, by embarking upon this enterprise of Government ownership and operation, in the construction of the Alaskan railroad, and in the purchase and operation of ships provided for in this bill, is placing a tax burden upon the American people in the aggregate of $75,000,000. Other men may feel free to assume the responsibility of imposing special taxes, onerous tax burdens, for purposes like this, for which the people have not declared themselves; but, as for me, I prefer to await the verdict of the people.

Woman Suffrage.

EXTENSION OF REMARKS

OF

HON. BURTON L. FRENCH,

OF IDAHO,

IN THE HOUSE OF REPRESENTATIVES,

Thursday, February 18, 1915.

Mr. FRENCH. Mr. Speaker, under the leave that has been granted to me I am placing in the RECORD remarks made by myself before the Committee on Election of the President, Vice President, and Representatives in Congress upon H. R. 9393, "A bill to protect the rights of women citizens of the United States to register and vote for Senators of the United States and Members of the House of Representatives."

That my remarks may be better understood, I shall insert here a copy of the bill itself:

Be it enacted, etc., That women who are citizens of the United States and possess such qualifications of age, residence, property, or education as may be required of men to make them legal voters in the several States shall be eligible to register and vote in all States of the Union at all elections for Senators of the United States and for Members of the House of Representatives.

I can not claim originality in the preparation of this measure, for a bill involving the same principle is now pending in the Senate, introduced by the Senator from Colorado, Mr. SHAFROTH, and at numerous times bills involving the same principles as applied to the election of the Members of the House of Representatives have been presented.

I offered the bill at the request of the United States Federal Suffrage Association, an organization made up of men and women from all parts of the United States, among whom are found many distinguished lawyers, which oragnization for more than 20 years has urged upon Congress that the grant to Congress by the Constitution of the control of the manner of electing the Senators and Members of the House of Representatives is broad enough to authorize Congress to grant by legislation to the women of the United States the right of suffrage as respects the election of Senators and Members of the House. My remarks before the committee were made on March 24, 1914, and are as follows:

"Mr. FRENCH. Mr. Chairman and gentlemen of the committee, as I understand it the committee at this time desires to hear some statement with regard to the constitutional features of the bill and not so much with regard to the general question of the advisability of extending the franchise to women throughout the United States. The bill itself is very similar to one introduced by myself in the last Congress, and at the time the hearings were held upon it I spoke somewhat with regard to the operation of woman's suffrage in the State that I represent, and in other committee meetings I have spoken with regard to the advisability of extending woman's suffrage from the broad standpoint and not from the technical constitutional standpoint of this particular bill. That being the case, I want at this time to call attention to a few features of the Constitution and to a few decisions that it seems to me have a bearing upon this particular measure. Mr. Chairman, whether or not this bill is constitutional must be determined by the express or implied powers and limitations placed upon the Congress of the United States and upon the States themselves by the Constitution. There is no line in that great instrument that says that women of the States shall not have the right of suffrage; there is none that says they shall have that right; there is none that says that men shall have the right of suffrage, and there is none that says that men shall not have that right. It is important in considering this question to outline what the Constitution really does say on this question. Section 2 of Article I of the Constitution provides:

"The House of Representatives shall be composed of members chosen every second year by the people of the several States.

"It further says in section 2, Article I, that—

"The electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State legislature.

"The Constitution further says in section 4 of the same article that—

"The times, places, and manner of holding elections for Senators and Representatives shall be prescribed in each State by the legislature thereof.

"Further, it says:

"But the Congress may at any time by law make or alter such regulations, except as to the place of choosing Senators.

"Beyond that is the general power conferred upon each Congress to be the judge of the qualifications and elections of its own Members. These, gentlemen, are the essential parts of the Constitution upon which you must base your decision as to the validity of the proposed measure. The Constitution declares, first, that Members of Congress shall be chosen by the people; second, that the electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State legislature; third, that Congress may determine by law the manner of their election; and, fourth, that each House is made the judge of the qualifications and election of its Members.

"Now, let us turn to the first guaranty, that 'Members of Congress shall be chosen by the people.' The important point to be determined here is who are the people. If women are not included as a part of the people, then manifestly we need go no further. Who, then, are the people? At the time of the adoption of the Constitution slaves were not included, apparently, as a part of the people and Indians who were not taxed were not included, apparently. With regard to slaves, the Dred Scott decision clearly points that out. In section 2, Article I, of the Constitution, it is provided that the representatives and direct taxes shall be apportioned among the several States upon the basis of the number of free persons, excluding Indians who are not taxed and three-fifths of all other persons—that is, slaves. More than that, Congress immediately, from the beginning, in the enactment of naturalization laws, recognized women of the white race as a part of the people. Congress from the very beginning recognized women as a part of the people and as citizens.

"The United States guarantees to citizens of one State the right to bring suit against citizens of another State, and the courts have uniformly held that that same guaranty pertains to women just as much as it pertains to men. Who, then, were included? Why, men were included and women were included, and men were included no more than women. Both free men and free women were people within the meaning of the Constitution when it was framed. Both were citizens. The fourteenth amendment to the Constitution of the United States declared that—

"All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States.

"That amendment did not seek to modify the status of women. Women are already citizens. That amendment applies, and was intended to apply, to negroes, although it is broad enough to include not only negroes but people of the yellow or brown races, people of the white race, and men and women of all races. The fact is that it was not necessary to pass the amendment so far as the white race was concerned. Both men and women of that race were citizens, and both were people within the meaning of the Constitution. (See Dred Scott decision.)

"In the well-known case of Minor *v.* Happersett (21 Wallace), this very question was considered. In 1874 Mrs. Virginia

M. Minor, a citizen of Missouri, attempted to vote, but was denied the privilege. She brought an action in the courts of the State and finally, on appeal, carried the question to the Supreme Court of the United States. In that case the Supreme Court, after discoursing on how the Congress has recognized women as citizens, says:

"Other proof of like character might be found, but certainly more can not be necessary to establish the fact that sex has never been made one of the elements of citizenship in the United States. In this respect men have never had an advantage over women. The same laws precisely apply to both. The fourteenth amendment did not affect the citizenship of women any more than it did of men. In this particular, therefore, the rights of Mrs. Minor do not depend upon the amendment. She has always been a citizen from her birth and entitled to all the privileges and immunities of citizenship. The amendment prohibited the State of which she is a citizen from abridging any of her privileges and immunities as a citizen of the United States; but it did not confer citizenship on her. That she had before its adoption.

"Of course the members of the committee know that the court decided that the contention of Mrs. Minor could not be sustained, but it was not because of the fact of anything within the Constitution, and it was not upon her raising her claim to vote under any law enacted by Congress similar to this granting to women generally the right to vote. The proponents of this measure urge that the authorization was in the Constitution at that time if Congress had seen fit to enact a law, but Congress had not done so, and it was in the absence of a statute upon the subject that the court made that decision.

"The CHAIRMAN. Did the court base its decision upon that ground?

"Mr. FRENCH. No, sir; the court did not go into that particular question. The court, as I recall it, let its decision turn more especially on what it contended was the fact that suffrage was not necessarily a component part of citizenship.

"The CHAIRMAN. That is what I thought.

"Mr. FRENCH. However, there are decisions that are counter to that and that suggest a different view.

"I submit that one of the basic elements of political conditions in any country such as ours is the right to have a part in the government of that country, or, in other words, the right of suffrage.

"What, then, do we have? First, that all persons born or naturalized in the United States and subject to its jurisdiction are citizens.

"Second. That sex is not an element of citizenship.

"It follows, then, that without the necessity of any further constitutional amendment the pending measure is constitutional, unless within the Constitution itself there may be some limitations upon the Congress.

"I have already called attention to the chief provisions upon which those rely who insist that this measure is not constitutional. They insist that since the States may fix the qualifications of electors for the most numerous branch of the State legislatures, these qualifications become at once the qualifications of those who may vote for Members of Congress. This would be true if there were not another limitation placed upon the States in the form of a power conferred upon the Congress. That limitation, in part, lies in the words, 'The Congress may at any time, by law, make or alter' the regulations of States touching the 'manner of holding elections for Senators and Representatives.' Gentlemen of the committee, when that particular clause was considered in the course of framing the Constitution in the Constitutional Convention, the first draft of it simply gave the Congress the power to 'make' the laws. After it had been referred to the committee for final revision, the committee seemed to be controlled by the idea that that power was not broad enough as conferred upon Congress and feared that after the States had themselves passed laws Congress would not be permitted to modify or amend those laws. I think that contention or fear was not sound. Nevertheless, in the abundance of caution which was in their minds, the committee rewrote the clause and inserted in it the privilege of 'altering' the regulations of the States touching the manner of holding the elections of Senators and Representatives.

"The CHAIRMAN. What does the word 'manner' there mean?

"Mr. FRENCH. I will come to that. I would say right now that right in that word there is wrapped up all there is involved in this particular question. The question involved is not one that has been passed upon fully by the Supreme Court. Unfortunately, under this provision of the Constitution the Federal Congress has not enacted much legislation that has brought cases to the Supreme Court that would to a very voluminous extent outline or define more particularly the meaning of the framers of the Constitution. I think the very first act of Congress that was passed under this clause of the Constitution was in 1842, when it was provided that Members of Congress should be elected from districts and not from the States themselves in mass. Another important law under this provision of the Constitution was passed in 1872, when the time was fixed for the election of Members of Congress. Other important acts of Congress under this provision probably include the one that the chairman of this committee reported within a recent Congress providing for the purification of elections in the United States so far as those elections concern Members of Congress.

"Aside from those laws, my judgment is that the only other important laws ever passed by Congress under this particular clause of the Constitution were laws that were passed during and following the Civil War and that had to do with the rights of persons who participated in the Civil War in opposition to the Union. It must also be said that all of those laws that were passed by the Congress, as urged in the forum of public opinion throughout the country and as urged before the Supreme Court by counsel, undoubtedly were modified by prejudice upon the part of people in the North and by prejudice upon the part of just as earnest people in the South. Here is a question, however, that need not involve that question. It is true that in part there is involved the same authority that Congress relied upon when it enacted the legislation that was considered then, but it is a question that need not involve the North or the South, but we may, all untrammeled by prejudices on account of former positions, consider candidly the constitutionality of this measure. What, then, is the meaning of the language of the Constitution? How broad is the language and what is meant by it? The relative power of the Government and the States has been the subject of much consideration. It was a subject of discussion when the question of ratifying the Constitution was debated in the conventions of the several States convened for the consideration of the question.

"I think, from an examination of the debates that occurred in the different conventions of the States convened for the purpose of ratifying the Constitution, that in nearly every one of them that particular paragraph was debated most earnestly—the paragraph that gave to Congress the power to make or alter, etc. I have examined the opinions of the prominent men who were instrumental in urging the ratification of the Constitution with that particular amendment included in it, and there is no doubt that there was jealousy upon the part of the States of the power of the Federal Government. But, on the other hand, there is no doubt that among profound thinkers there was a strong feeling that the Government itself ought to be given the power to control the general manner of conducting elections in this country. That question was debated in the Virginia convention. In that convention James Madison, who was one of the framers of the Constitution, declared that the manner of holding elections was properly reserved to the Federal Government. He said:

"Should the people of any State by any means be deprived of the right of suffrage, it was judged proper it should be remedied by the Federal Government. It was found to be impossible to fix the time, place, and manner of election of Representatives in the Constitution. It was found necessary to leave the regulation of these, in the first place, to the State governments, as being best acquainted with the true situation of the people, subject to the control of the General Government, in order to enable it to produce uniformity and prevent its own dissolution. And considering the State governments and the General Government as distinct bodies, acting in different and independent capacities for the people, it was thought that the particular regulations should be submitted to the former—that is, to the States—and the general regulations to the latter—

"That is, to the General Government. For further consideration of this feature, I call attention in this connection to Elliott's Debates, pages 366 and 367.

"Now, that is what Madison thought. He declared that should the people of any State by any means be 'deprived of the right of suffrage' it was judged proper that it should be 'remedied by the Federal Government'; and he pointed out the place where this power to remedy was lodged in the Constitution. He pointed it out as the paragraph conferring upon Congress the power to regulate the manner of electing Senators and Representatives. He was quite willing that minor regulations, 'particular regulations,' to use his exact words, should be left to the States. This might include age; it might include property qualifications; it might include length of residence in a voting precinct; and it might include a multitude of minor matters that the States thought important. But he thought that the general regulations should be left to the Federal Government. He thought that if the people of any State by any means were to be deprived of the right of suffrage it was judged proper it should be remedied by the Federal Government. This he included under the heading 'General regulations.'

"Suppose a State were to pass a law denying suffrage generally to the citizens of the State, in so far as it concerns the election of Members of Congress, and conferring it upon, say,

members of certain professions, such as lawyers, professors in universities, and members of the ministry. Would it not be under this clause of the Constitution that the citizens of our country would rely in seeking relief, in connection with that other clause in section 2 of Article I, which declares that the House of Representatives shall be chosen by the people? Or, rather, would it not have been so prior to the adoption of the fourteenth and fifteenth amendments? The fact is that the suggestion or illustration I have made is not an unreasonable one. Go, if you please, to Japan, a country that has a splendid Government and that recognizes suffrage in a very extensive manner, but at the same time provides that in the Parliament there shall sit members who are the representatives of learned bodies, universities, etc. The Japanese people believe that these people have superior qualifications for the administration of governmental affairs.

"Now, suppose, I say, that in one of the States of the Union this idea should so impress itself upon the people of the State or the legislative body that in that State they should limit suffrage as it pertains to the election of the legislature and so to the election of Members of Congress—that is, to the Senate and the House—to lawyers and to professors in universities and to the ministry. Under what clause of the Constitution would the people of that State ask that their rights be protected? We do not have a parallel to that in the actual experience of this country, but I submit that it is within the reasonable bounds of possibiliy that it might occur, and I submit, further, that it was to prevent just such an occurrence as that that Madison and the other framers of the Constitution felt that the Federal Government should be clothed with the general power of regulating the manner of holding elections.

"But the court has said in the case of Minor *v.* Happersett, heretofore referred to, that the fourteenth amendment did not affect the citizenship of women any more than it did the citizenship of men. So would it not be possible for the citizens of our country to claim their rights through the constitutional guarantee alone that Members of the House of Representatives shall be chosen by the people? And would the Congress not invoke the authority of Article I, section 4, conferring upon it power to determine the manner of holding elections, to say that the rights of the people shall be protected? If so, would that be carrying the definition of the word 'manner' further than is proposed in the pending bill? Absolutely not.

"I do not rely upon my own reasoning. A few cases have been considered by the Supreme Court of the United States that involve in some degree the question of the extent to which the Congress may go in determining the meaning of the word 'manner' and the inherent right that exists in the Federal Government to deal broadly with the question of suffrage as it concerns those who may participate in the election of Members of Congress. Likewise the Congress itself in election cases has given some attention to this matter and in the passage of bills bearing upon the rights of people within the United States touching suffrage.

"In the case entitled 'Ex parte Yarbrough' (110 U. S., 651) there is much in the opinion of the court that is highly interesting. In that case Yarbrough and certain associates were charged in the indictment with conspiracy to intimidate a negro in the exercise of his right to vote for a Member of Congress, and in the execution of their conspiracy they wounded and otherwise maltreated him.

"It is true that this case arose out of the amendment to the Constitution conferring suffrage upon the negro race, but much that was said by the court is pertinent to this question. In that case counsel had insisted upon express authority in the Constitution, and the court restated the contention and then answered it:

"Because there is no express power to provide for preventing violence exercised on the voter as a means of controlling his vote, no such law can be enacted. It destroys at one blow, in construing the Constitution of the United States, the doctrine universally applied to all instruments of writing, that what is implied is as much a part of the instrument as what is expressed. This principle, in its application to the Constitution of the United States, more than to almost any other writing, is a necessity, by reason of the inherent inability to put into words all derivative powers—a difficulty which the instrument itself recognizes by conferring on Congress the authority to pass all laws necessary and proper to carry into execution the powers expressly granted and all other powers vested in the Government or any branch of it by the Constitution. (Art. I, sec. 8, clause 18.)

"We know of no express authority to pass laws to punish theft or burglary of the Treasury of the United States. Is there, therefore, no power in the Congress to protect the Treasury by punishing such theft and burglary?

"Further on in the decision the court said:

"It is not true, therefore, that electors for Members of Congress owe their right to vote to the State law in any sense which makes the exercise of the right to depend exclusively on the law of the State.

"Counsel for petitioners, seizing upon the expression found in the opinion of the court in the case of Minor *v.* Happersett (21 Wall., 162), that 'the Constitution of the United States does not confer the right of suffrage upon anyone,' without reference to the connection in which it is used, insists that the voters in this case do not owe their right to vote in any sense to that instrument.

"But the court was combating the argument that this right was conferred on all citizens, and therefore upon women as well as men.

"In opposition to that idea it was said that the Constitution adopts as the qualification for voters for Members of Congress that which prevails in the State where the voting is to be done; therefore, said the opinion, the right is not definitely conferred on any person or class of persons by the Constitution alone, because you have to look to the law of the State for the description of the class. But the court did not intend to say that when the class or the person is thus ascertained his right to vote for a Member of Congress was not fundamentally based upon the Constitution, which created the office of Member of Congress and declared it should be elective, and pointed to the means of ascertaining who should be electors.

"Again, in that opinion the court said, in reference to the right conferred upon the negro by the fifteenth amendment to the Constitution:

"This new constitutional right was mainly designed for citizens of African descent. The principle, however, that the protection of the exercise of this right is within the power of Congress is as necessary to the right of other citizens to vote as to the colored citizen, and to the right to vote in general as to the right to be protected against discrimination.

"The exercise of the right in both instances is guaranteed by the Constitution and should be kept free and pure by congressional enactments whenever that is necessary.

"And again:

"But it is a waste of time to seek for specific sources of the power to pass these laws. Chancellor Kent, in the opening words of that part of his Commentaries which treats of the Government and constitutional jurisprudence of the United States, says:

"'The Government of the United States was created by the free voice and joint will of the people of America for their common defense and general welfare. Its powers apply to those great interests which relate to this country in its national capacity, and which depend for their protection on the consolidation of the Union. It is clothed with the principal attributes of political sovereignty, and it is justly deemed the guardian of our best rights, the source of our highest civil and political duties, and the sure means of national greatness.' (1 Kent's Com., 201.)

"It is essential to the successful working of this Government that the great organisms of its executive and legislative branches should be the free choice of the people as that the original form of it should be so. In absolute governments, where the monarch is the source of all power, it is still held to be important that the exercise of that power shall be free from the influence of extraneous violence and internal corruption.

"In a republican government, like ours, where political power is reposed in representatives of the entire body of the people, chosen at short intervals by popular elections, the temptations to control these elections by violence and by corruption is a constant source of danger.

"Such has been the history of all republics, and, though ours has been comparatively free from both of these evils in the past, no lover of his country can shut his eyes to the fear of future danger from both sources.

"If the recurrence of such acts as these prisoners stand convicted of are too common in one quarter of the country, and give omen of danger from lawless violence, the free use of money in elections, arising from the vast growth of recent wealth in other quarters, presents equal cause for anxiety.

"If the Government of the United States had within its constitutional domain no authority to provide against these evils, if the very sources of power may be poisoned by corruption or controlled by violence and outrage, without legal restraint, then, indeed, is the country in danger, and its best powers, its highest purposes, the hopes which it inspires, and the love which enshrines it are at the mercy of the combinations of those who respect no right but brute force on the one hand, and unprincipled corruptionists on the other.

"Bearing upon the power of Congress to enact legislation that has to do with the exercise of the right of suffrage and the right of citizens to be protected, I call the committee's attention to the case of Ex parte Clarke (100 U. S., 103) and to the case of Wiley *v.* Sinkler (179 U. S., 62). In the latter case the court said:

"The right to vote for Members of the Congress of the United States is not derived merely from the constitution and laws of the State in which they are chosen, but has its foundation in the Constitution of the United States.

"I also call the committee's attention to Ex parte Siebold (100 U. S., 383), in which the court, in discussing this general question, gave expression to its view of the power of Congress in the following language:

"So in the case of laws for regulating the elections of Representatives to Congress. The State may make regulations on the subject; Congress may make regulations on the same subject or may alter or add to those already made. The paramount character of those made by Congress has the effect to supersede those made by the State, so far as the two are inconsistent, and no further. There is no such conflict between them as to prevent their forming a harmonious system perfectly capable of being administered and carried out as such.

"And again:

"If Congress does not interfere, of course, they may be made wholly by the State; but if it chooses to interfere, there is nothing in the words to prevent its doing so, either wholly or partially. On the contrary, their necessary implication is that it may do either. It may either make the regulations or it may alter them. If it only alters, leaving, as manifest convenience requires, the general organization of the polls to the State, there results a necessary cooperation of the two Governments in regulating the subject. But no repugnance in the system of regulations can arise thence, for the power of Congress over the subject is paramount. It may be exercised as and when Congress sees fit to exercise it. When exercised, the action of Congress, so far as it extends and conflicts with the regulations of the States, necessarily supersedes them. This is implied in the power to 'make or alter.'

"And again:

"It is the duty of the States to elect Representatives to Congress. The due and fair election of these Representatives is of vital importance to the United States. The Government of the United States is no less cerned in the transaction than the State government is.

"And further:

"This power to enforce its laws and to execute its functions in all places does not derogate from the power of the State to execute its laws at the same time and in the same places. The one does not exclude the other, except where both can not be executed at the same time. In that case the words of the Constitution itself show which is to yield. 'This Constitution, and all laws which shall be made in pursuance thereof, * * * shall be the supreme law of the land.'

"But let us see how Congress has construed the power conferred upon it of directing the manner of holding elections. The House of Representatives in the Twenty-eighth Congress, in the election case of Botts *v.* Jones, from Virginia (Hinds' Precedents, Vol. I, p. 811) considered this question. Votes were cast for the contestant, Butts, and they were thrown out upon the ground that they were votes cast by persons of foreign birth, who, while they had taken the oath of fidelity to the Commonwealth of Virginia, and consequently were eligible to vote for the members of the most numerous branch of the State legislature, were not citizens of the United States. The Congress evidently felt that they were not 'people of one of the several States,' even though they were citizens of Virginia and eligible to vote. The committee making the report was not unanimous. The majority, however, contended that the power of the Federal Government to enact naturalization laws was a limitation upon the provision of the Constitution defining electors of Members of Congress as those who were eligible to vote for the members of the most numerous branch of the State legislature. The minority report earnestly contended that the Constitution gave to the States the power to confer the right to vote—just as people have urged since, that it has—notwithstanding the naturalization provision of the Constitution. The majority report was sustained. And I would say further that until the constitutional amendment No. 14 was passed there never was in the Constitution or amendments a definition of 'citizens' within the United States, and yet the House of Representatives, following the election, refused to recognize as controlling that guaranty to the States, that they had the right to fix the qualifications of those who could vote for Members of Congress as those who were eligible to vote for members of the most numerour branch of the State Legislature of Virginia.

"Oh, but it is urged Congress took this position because of that other clause of the Constitution which confers upon each House the right to be the judge of the qualifications and elections of its own Members. The Constitution says, Article I, section 5, 'Each House shall be the judge of the elections, returns, and qualifications of its own Members.' Those who take this position that the House acted upon its authority contained in that paragraph will hardly contend that the language used is any broader than the language used in Article I, section 4, that confers upon the Congress the power at any time to 'make or alter such regulations' touching the 'manner' of holding elections.

"If the language is not broader, and it strikes me that it is not, then it means either that Congress does have the right in a large sense to determine who shall be eligible to vote for Members of Congress, the same as many believe section 4 of Article I means, or else the House arbitrarily refused to seat the Member and relied upon no higher authority than its 'will' or 'decree' in a matter from which there was no appeal.

"Another case that is most interesting as involving the question of how far the Congress may go in passing laws abridging the suffrage of people as regards voting for Members of Congress who are eligible to vote in the several States for the members of the most numerous branch of the State legislature is the Kentucky election case of McKee *v.* Young in the Fortieth Congress. (Hinds, Vol. I, p. 451.) Upon the face of the returns Young received the majority of the votes cast. In the contest against him it was established to the satisfaction of the committee that Young was not himself entitled to membership in the House of Representatives because of his having been under the disqualification of aiding those who were in arms against the United States. It was urged, however, that the votes that were cast for Young were in large part the votes of soldiers who had participated in the rebellion, and that these votes ought not to be counted, and if not counted that McKee be seated.

"Congress some two years before this case was considered, or on March 3, 1865, had passed an act which decitizenized by their own voluntary act certain persons who had deserted from the military or naval service of the United States. Of the votes that were cast for Young and which were rejected were 625 votes of former Confederate soldiers and 8 votes of deserters from the Union forces. Kentucky had not been the subject of reconstruction legislation; Kentucky had not seceded from the Union, and the persons I have referred to, including those who had served in the Confederate Army and those who had deserted from the Union Army, were eligible to vote for the members of the most numerous branch of the Kentucky State Legislature. It was vehemently urged that the constitutional guaranty touching the eligibility of those who might be permitted to vote for Members of Congress was being violated. It was urged most strongly that the Constitution gave to the States the power to determine who should vote for the members of the most numerous branch of the State legislature. In the minority report from the Committee on Elections, Messrs. Kerr and Chanler, in referring to these votes, declared, 'They were still, under the constitution and laws of Kentucky, qualified electors of the most numerous branch of the State legislature, and had as much right to vote for a Member of Congress under the Constitution of the United States as the candidates themselves.'

"In spite of this the Congress of the United States upheld the act of Congress of March 3, 1865. In spite of this the House rejected all of these votes, 633 in number, of persons who were eligible to vote for members of the most numerous branch of the State Legislature of Kentucky. Mr. McKee was awarded his seat in Congress.

"Here is a case in which the Congress by law did limit the right of suffrage notwithstanding the guarantee to the several States and to those eligible to vote for members of the most numerous branch of the State legislature. Here is a case in which the House affirmed, in spite of bitter contentions, the power of Congress so to act, and the right of the House to inquire not only into the qualifications and elections of persons presenting themselves to membership in the House, but to inquire, in the broad sense, into the qualifications of those who voted for the candidates for Congress under an act that the Congress had passed.

"The bill that I have introduced involves the same principle of whether or not the Congress may assume under the Constitution to define in a general way those who may be entitled to vote for Members of the Senate and House of Representatives.

"Would not the act of Congress of March 3, 1865, be regarded as the result of the exercise by Congress of what Madison termed the power of 'general regulation' conferred upon Congress and would not the present bill fall in the same class?

"If this Congress is clothed with the power to determine the manner of election of Members of the Senate and the House, if each body is clothed with the power to be the sole judge of the qualifications and elections of Members that may constitute each body, and if, as I have shown, one or the other of these great bodies has absolutely refused to recognize as entitled to membership in the Congress men elected by persons who were qualified to vote in the States in which their votes were cast, for the members of the most numerous branch of the State legislature, may we not conclude that Congress has already passed upon this question so far as the broad principle may be concerned and has determined that it has far more authority than those who are urging against this measure are willing to concede?

"Indeed, if the Congress has the power, each body acting by itself, to reject the credentials of men who claim to be elected by the votes of people who are eligible to vote for members of the most numerous branch of the State legislature of the State in which their vote has been cast, may we not suppose that in the interest of orderly system alone the Congress would have the power prior to the casting of the votes to declare what votes would be regarded in the election of a Member of either House or Senate? Surely this would be in the interest of orderly procedure, and such a course as this would mean that every State would understand what votes would and what would not be regarded as satisfactory in supporting the credentials of a Member elected to either body.

"Touching the opinion of Congress as indicated by later expressions of opinion found in committee reports, I beg to call the attention of the committee to the majority and minority report in the Fifty-third Congress on H. R. 2331, a bill for the repeal of Federal election laws. The report is No. 18, and and Mr. Tucker, in presenting the majority report, strongly contends for the greatest latitude touching the right and conditions of suffrage as resting in the States.

"Mr. Johnson, of North Dakota, who presented the minority report, reviews the other side of the question very fully, and points out some of the views entertained by those who had to do with the writing of the Constitution and some of the views that have been entertained by the courts since that time.

"The report of Senator LODGE, when a Member of the House in the Fifty-first Congress, first session, upon H. R. 11045, report No. 2493, likewise reviews the question with great care.

The report does not pretend to touch upon the question of the right of women to vote under the Constitution. It deals with the power of Congress under the clause conferring upon Congress the right to make or alter laws touching the manner of elections.

"Let me quote briefly a few excerpts from the report:

"This necessary power is found in section 4, Article I, of the Constitution of the United States, which is as follows:

"'The times, places, and manner of holding elections for Senators and Representatives shall be prescribed in each State by the legislature thereof; but the Congress may at any time by law make or alter such regulations, except as to the places of choosing Senators.'

"The language employed in this section is so plain that it would seem almost superfluous to enter into argument or discussion as to its meaning. If words mean anything those just quoted mean that the power of Congress over the conduct of elections of Members of this body is absolute and complete. The Constitution says that Congress may make all regulations in regard to the election of Representatives, and the power to 'make regulations' thus conferred is in terms exclusive and paramount. But out of abundance of caution the framers of the Constitution went further and added to the word 'make' the words 'to alter'; that is, under the Constitution Congress has power to assume complete control of elections of its Members and conduct them at such times and places and through such officers and under such rules as it may see fit. On the other hand, Congress may under this clause leave the entire regulation of the election of Representatives to the States, or it may take a partial control of a part of the necessary procedure and leave what remains to the State, or it may alter and amend the State regulations and supervise and enforce their execution.

* * * * * * *

"And again:

"On the contrary, as already said, we think it clear that the clause of the Constitution relating to the regulation of such elections contemplates such cooperation whenever Congress deems it expedient to interfere merely to alter or add to existing regulations of the State. If the two Governments had an entire equality of jurisdiction there might be an intrinsic difficulty in such cooperation. Then the adoption by the State government of a system of regulations might exclude the action of Congress. By first taking jurisdiction of the subject the State would acquire exclusive jurisdiction in virtue of a well-known principle applicable to courts having coordinate jurisdiction over the same matter. But no such equality exists in the present case. The power of Congress, as we have seen, is paramount, and may be exercised at any time and to any extent which it deems expedient; and so far as it is exercised, and no further, the regulations effected supersede those of the State which are inconsistent therewith.

"And again:

"On a matter of such importance, however, it will not be amiss to cite a few controlling authorities and to show that the power of Congress in regard to the election of Representatives is not only paramount but that it can be exercised to any degree, from total control downward, which Congress may deem wise. In the convention of 1787, on the 9th of August, Mr. Pinckney and Mr. Rutledge moved to strike out the words which in the draft then before the convention conferred this power upon Congress. The motion was lost, apparently, without a division, and, if we may judge from Mr. Madison's notes, had no serious support in the convention. The remarks made, however, in opposition to the motion of Mr. Pinckney show clearly the view taken of this clause by the framers of the Constitution and the paramount character of the power conveyed by it, although in the draft then under consideration the clause was much less sweeping than it afterwards became in the instrument as adopted.

"I want to call attention briefly to some of the objections to this bill.

"Mr. MAPES. May I ask you a concrete question?

"Mr. FRENCH. Yes.

"Mr. MAPES. Whether the gist of your argument is that the fourteenth amendment was not necessary to authorize Congress to pass a law to the same effect as the fourteenth amendment?

"Mr. FRENCH. Oh, I think not; the fifteenth amendment, not the fourteenth.

"Mr. MAPES. The race, color, or previous condition of servitude amendment?

"Mr. FRENCH. The fifteenth amendment, not the fourteenth. I think the fourteenth was necessary, but I think that the fifteenth amendment can very properly be classed as surplusage, and that is was passed as an overabundance of assurance to the negro race at that particular time.

"Mr. MAPES. In your opinion, Congress could have passed a law to the same effect and it would have been constitutional?

"Mr. FRENCH. That is my judgment of it. That is a question that is not necessarily original with me; at the same time, it is a view of the question that I have concurred in. The constitutionality of this bill does not necessarily rest upon the fourteenth amendment. It rests upon the other provisions of the Constitution to which I have referred.

"It is urged that this bill is not constitutional because of the fourteenth amendment granting to slaves the right of citizenship. The fact is that that is not a parallel case. At the time the Constitution was framed slaves were not permitted to vote in any State of the Union, they were not citizens, while on the other hand women were citizens of all States and were permitted to vote in at least one State—I am reminded that it was in two States—but at least in the State of New Jersey they were permitted to vote until 1807, whereas negroes, who were slaves, were not permitted to vote in any State.

"I want in this connection to insert, in brief, the qualifications of suffrage in all the States.

"When the Federal Constitution was adopted, all the States, with the exception of Rhode Island and Connecticut, had constitutions of their own. These two continued to act under their charters from the Crown. Upon an examination of those constitutions we find that in no State were all citizens permitted to vote. Each State determined for itself who should have that power. Thus, in New Hampshire, 'every male inhabitant of each town and parish with town privileges, and places unincorporated in the State, of 21 years of age and upward, excepting paupers and persons excused from paying taxes at their own request,' were its voters. In Massachusetts 'every male inhabitant of 21 years of age and upward, having a freehold estate within the Commonwealth of the annual income of £3, or any estate of the value of £60.' In Rhode Island 'such as are admitted free of the company and society' of the colony. In Connecticut such persons as had 'maturity in years, quiet and peaceable behavior, a civil conversation, and 40 shillings freehold or £40 personal estate,' if so certified by the selectmen.

"In New York 'every male inhabitant of full age who shall have personally resided within one of the counties of the State for 6 months immediately preceding the day of election * * * if, during the time aforesaid, he shall have been a freeholder, possessing a freehold of the value of £20 within the county, or have rented a tenement therein of the yearly value of 40 shillings, and been rated and actually paid taxes to the State.' In New Jersey 'all inhabitants * * * of full age who are worth £50, proclamation money, clear estate in the same, and have resided in the county in which they claim a vote for 12 months immediately preceding the election.' In Pennsylvania 'every freeman of the age of 21 years, having resided in the State 2 years next before the election, and within that time paid a State or county tax which shall have been assessed at least 6 months before the election.' In Delaware and Virginia 'as exercised by law at present.' In Maryland 'all freemen above 21 years of age having a freehold of 50 acres of land in the county in which they offer to vote and residing therein, and all freemen having property in the State above the value of £30 current money, and having resided in the county in which they offer to vote 1 whole year next preceding the election.' In North Carolina, for senators, 'all freemen of the age of 21 years who have been inhabitants of any one county within the State 12 months immediately preceding the day of election, and possessed of a freehold within the same county of 50 acres of land for 6 months next before and at the day of election,' and for members of the house of commons 'all freemen of the age of 21 years who have been inhabitants in any one county within the State 12 months immediately preceding the day of any election, and shall have paid public taxes.'

"In South Carolina 'every free white man of the age of 21 years, being a citizen of the State and having resided therein 2 years previous to the day of election, and who hath a freehold of 50 acres of land, or a town lot of which he hath been legally seized and possessed at least 6 months before such election, or (not having such freehold or town lot), hath been a resident within the election district in which he offers to give his vote 6 months before said election, and hath paid a tax the preceding year of 3 shillings sterling toward the support of the Government'; and in Georgia such 'citizens and inhabitants of the State as shall have attained to the age of 21 years, and shall have paid tax for the year next preceding the election, and shall have resided 6 months within the county.' (Minor *v.* Happersett, 88 U. S., pp. 172–173.)"

The Shipping Bill.

EXTENSION OF REMARKS
OF
HON. LADISLAS LAZARO,
OF LOUISIANA,
IN THE HOUSE OF REPRESENTATIVES,

Wednesday, February 17, 1915,

On the bill (S. 5259) to establish one or more United States Navy mail lines between the United States and South America and between the United States and the countries of Europe.

Mr. LAZARO. Mr. Speaker, having studied this shipping bill thoroughly from every standpoint, and after having heard it discussed from every angle here to-day, I have come to the conclusion that it is a good bill, and I shall vote for it. This is an emergency measure to meet a very serious condition brought about by the war in Europe. The situation should be plain to any thinking man. We had neglected our merchant marine—so much so that all three of the platforms of 1912 contained planks acknowledging this and promising the people relief. We did not realize how few ships we really have until the war broke out. From that day until now it has been difficult, and almost impossible at times, to ship the products of our farms, our mines, mills, and factories to the markets of the world. Not only that, but the Shipping Trust soon took advantage of this condition and raised their ocean rates until they are almost prohibitive. For example, we are to-day paying about fifteen times more than we paid before the war to ship our cotton to foreign ports. So the question comes up, Is this great Government of ours to submit to this Shipping Trust and permit the products of our people to rot at the docks when there is so much demand for them everywhere? I think not.

Of course, the Republicans being in the minority in this House, they are trying to make political capital of it and they are conducting one of the worst filibusters in the history of this Congress. They are criticizing us for adhering to our Demo-

cratic platform, which promises the people to enact laws to promote the growth of our merchant marine in order to develop and strengthen the commercial ties which bind us to other countries, but they offer nothing as a substitute for this measure. We all know that their idea of building up a merchant marine is by subsidy, taking the money out of the Treasury of the United States and giving it to a few shipowners. No member of the opposition so far has brought forward any substitute bill to relieve this serious situation, which this bill is brought forward to meet.

It is admitted that individual enterprise can not be depended on at this time and in this emergency. No one denies the emergency nor the prohibitive freight rates, and yet they tell us we have enough ships. It stands to reason that if we had enough ships the rates would not be so high.

We have to decide now whether this Government of ours should help relieve this paralysis of our foreign commerce or whether, by refusing to help, it will permit this paralysis to continue until the war is over. In normal times it may be that we could solve the problem in some other way, and I am not prepared to say whether I would vote for a measure of this kind in times of world peace; but these are abnormal times, and conditions have to be met as we find them.

Some say that if we enact this measure into law it would cause international complications. We have international complications now, and I do not believe that anyone would imagine for a moment that President Wilson would use the power given him by this act to bring about war, when we know that he is laboring day and night to prevent war.

This emergency measure is taking no privilege or opportunity from private enterprise. Its sole aim and purpose is to provide the country with shipping absolutely needed to carry on its commerce with the other nations of the world at a moment when the lack of ships is causing congestion of our commerce and causing transportation charges to go up until they are almost prohibitive. In his Indianapolis speech, on January 8, President Wilson spoke as follows on this subject:

> Do you know, gentlemen, that the ocean freight rates have gone up in some instances to ten times their ordinary figure? And that the farmers of the United States, those who raise grain and those who raise cotton—these things that are absolutely necessary to the world as well as to ourselves—can not get any profit out of the great prices that they are willing to pay for these things on the other side of the sea because the whole profit is eaten up by the extortionate charges for ocean carriage? In the midst of this the Democrats propose a temporary measure of relief in a shipping bill.
>
> The merchants and the farmers of this country must have ships to carry their goods, and just at the present moment there is no other way of getting them than through the instrumentality that is suggested in the shipping bill; and I hear it is said in Washington on all hands that the Republicans in the United States Senate mean to talk enough to make the passage of that bill impossible.

And, as he said in his address, the Republicans in the United States Senate are trying to talk it to death. It seems to me that our duty here now is to uphold his hands in this great emergency, brought about by this horrible war, and give relief to the people of this country by enacting this measure into law and putting an end to this Shipping Trust, which now has such a firm grip on the throat of our commerce.

Abstract of Speech by Charles S. Hamlin, Governor of the Federal Reserve Board, Before the Chicago Real Estate Board, Chicago, February 13, 1915.

EXTENSION OF REMARKS

OF

HON. J. THOMAS HEFLIN,

OF ALABAMA,

IN THE HOUSE OF REPRESENTATIVES,

Friday, February 19, 1915.

Mr. HEFLIN. Mr. Speaker, under the leave granted to me to extend my remarks in the RECORD, I include an abstract of a speech delivered by Charles S. Hamlin, governor of the Federal Reserve Board, before the Chicago Real Estate Board, Chicago, February 13, 1915, as follows:

The 12 Federal reserve banks, under the new banking system, were opened on November 16, 1914. Although barely 10 weeks have elapsed since their opening, much has been accomplished in the way of placing the operation of our banking system on a secure, firm foundation.

We can better understand what the new system is if we consider the conditions which existed under the old system, under which there were approximately 7,500 independent banks and 7,500 independent reserves. Although called reserves, they could not, in fact, be used except in violation of law, and if at any time they happened to fall below the legal limit the bank was legally required to suspend business until they were restored, and nothing but the forbearance of the Comptroller of the Currency could save the bank from being placed in the hands of a receiver in case the depleted reserves were not restored.

I have said that these reserves were all independent; there was, however, a certain interdependence caused by the deposit of a certain portion of the reserves with reserve agents in reserve cities, but this interdependence was one rather of danger than of security.

Furthermore, when the banks had performed their function of discounting notes, the notes discounted remained in the bank vaults, buried beyond hope of resurrection until maturity, and if a bank were to take these notes out of its vaults and rediscount them such an act tended to make people distrust its condition.

In addition, the national-bank currency issued by the banks was chained to Government bonds. When contraction was necessary, it was difficult to secure it; when expansion was needed, it was slow and cumbersome, often taking effect only after the necessity had passed away. In fact, these national-bank notes often increased when they should have decreased, and, conversely, decreased when they should have increased.

It was certainly a strange anomaly to link together the national currency, supposedly responsive to the needs of expanding business, with Government bonds representing war and other necessities of the past. Yet this is what the former system did; the extension of the trade and commerce of the twentieth century was indissolubly linked with the evidences of the destruction of trade and commerce of the nineteenth century. While there may have been some justification for this strange alliance in the nineteenth century, there is surely none in this twentieth century, and it is earnestly to be hoped that the method provided in the Federal reserve act for retiring the national-bank currency and substituting the new Federal reserve notes may prove efficacious.

The old banking system rested, in effect, upon the call loan. The bank had to have liquid assets, and the call loan was the only liquid asset. How liquid such assets were was seen by the panic of 1907, and again in 1914, when the closing of the stock exchanges took from such loans the only semblance of liquidity they had.

The dependence of our banking system upon assets which were liquid only when liquidity was not needed, and which were unsalable at times when liquid assets were needed, has resulted in a banking system which financial experts pronounce as one of the worst in the world and utterly unsuited to the financial needs of the United States.

The United States is entitled to the best banking system in the world, and I believe the Federal reserve system just established will fully meet its needs.

The extraordinary events just prior to the opening of the Federal reserve banks are familiar to all. The steady exportation of our gold, the unprecedentedly high rates for foreign exchange, the derangement of our export trade caused by the war, the constantly increasing balances against us on current international commercial transactions, the piling up of reserves by many banks throughout the country at a time when they should have drawn upon them, and, finally, the hoarding of gold by both banks and individuals, culminated in a condition probably the most ominous in the history of our country.

How our new banking system was able to meet this dangerous situation, and how successfully we emerged from it, constitute an epoch in the financial history of the world. A slight study of the situation will reveal some of the difficulties and what was done to overcome them.

During the calendar year 1914 there was exported from the United States gold to the amount of over two hundred and twenty-two millions; during the same period there was imported over fifty-seven millions, the net exports amounting to about one hundred and sixty-five millions. For the same period the production of gold in the United States amounted, approximately, to ninety-two millions. The total stock of gold held by the Treasury, the banks, and in circulation on January 1, 1914, was estimated to be, approximately, one thousand nine hundred and four millions, while on January 1, 1915, it was estimated to be about one thousand eight hundred and fifteen millions, a decrease of eighty-nine millions.

When it is considered that the United States was able to export one hundred and sixty-five millions of gold in the calendar year and yet reduce its total gold by only eighty-nine millions, a decrease of only 4.6 per cent, some idea of the strength

of the United States in gold holdings and gold production will be conveyed.

Certain unusual relief measures were also undertaken and successfully accomplished, which, in connection with the operations of the Federal reserve system, turned the tide and brought about confidence in place of fear, and financial stability in place of unsound monetary conditions.

Among these measures was the deposit by the Secretary of the Treasury of crop-moving funds of about $37,000,000 in banks in different parts of the country, all of which was promptly returned, together with over $267,000 in interest. In addition, the Secretary of the Treasury issued and shipped to various banks about $380,000,000 of Aldrich-Vreeland emergency currency, of which all but about sixty-seven millions has already been redeemed. This latter measure of relief was made possible by the Federal reserve act, which amended the so-called Aldrich-Vreeland Act by lowering the tax imposed upon the notes and increasing the limit of issue. The redemption of these notes was also facilitated by the Federal reserve notes.

These measures gave much relief to the situation, but much was left to be done to place our finances on an absolutely sound basis.

A careful investigation into the international indebtedness of our people abroad showed that our current indebtedness was about $500,000,000, all payable in gold. To take care of this situation pending the revival of our export trade, a gold fund of over $100,000,000 was subscribed by the banks, national and State, in the reserve cities. This fund quickly demonstrated the desire and ability of our people to pay all their foreign obligations, properly payable in gold, in that metal, and this, too, in face of the fact that a large indebtedness owed us from abroad could not be liquidated because of the moratoria in England and other foreign countries.

As the result of the opening of the Federal reserve system and of these relief measures confidence quickly took the place of uncertainty, and little gold had to be shipped out of the country. In a comparatively short space of time our increasing exports took the place of gold, which otherwise must have been shipped. Foreign exchange fell to the importing point, and our country became a creditor instead of a debtor on current commercial exchanges.

In order to relieve the situation in the South a cotton fund of $135,000,000 was subscribed, so that the agriculturists who were producing cotton were enabled to make long-time loans based on cotton security. As was the case with the gold fund, but little of this fund was used, but the fact that it existed was a powerful incentive to a restoration of confidence, and it accomplished its work successfully.

The establishment of the Federal reserve system has been, as I have said, a potent cause in our financial recovery, and it is well to point out upon what theory the system is based and what it has already accomplished.

In the first place, it established lower reserve requirements, thus releasing an enormous amount of cash as a basis for future credit operations. It mobilized a material proportion of the reserves of the banks in the Federal reserve banks, thus furnishing a fund from which banks could be assisted in rediscounting commercial paper. Thus commercial paper, which previously had to be held in the vaults of the bank until maturity, can now be used as a basis for rediscounts at Federal reserve banks, and this paper has now become a liquid asset, far more liquid than the call loan on the stock exchange.

An elastic note issue was also provided for, secured by a 40 per cent gold reserve and by commercial paper up to the face value of the notes issued. Thus we have at hand a really elastic currency, rising and falling in response to the needs of agriculture, commerce, and industry. Acceptances in the import and export trade are also permitted to be discounted by Federal reserve banks, and the member banks for the first time were authorized to accept bills drawn upon such transactions.

It can be stated with confidence that under the Federal Reserve System we shall see no more financial panics. The member banks no longer need to keep a dollar in excess of their lawful reserves. They can even check against and withdraw their reserves deposited in the Federal reserve banks under regulations of the Federal Reserve Board, which latter board can suspend any and all reserve requirements of the act when deemed necessary.

Under the Federal reserve system the member banks have to furnish the capital for the Federal reserve banks and deposit a material part of their reserves in said banks. Every dollar of this amount is held in trust for agriculture, commerce, and industry of the United States and is forever removed from the call-loan market. In addition, every dollar deposited by the Government with the Federal reserve banks over and above what is checked against for paying Government debts is impressed with a similar trust for the same purposes.

The transfer of capital and reserve deposits was made by the member banks without the slightest trouble and without the slightest confusion in business. Many feared that these transfers could not be accomplished without calling in loans and otherwise injuring legitimate business, but this fear was quickly dispelled when it was found how easily and simply the transfer was made. The Federal Reserve Board requested the banks to make these payments, as far as possible, out of their own vaults, and also, as far as possible, in gold, and the banks cheerfully complied with this request, so that at the present time a very large proportion of the assets of the Federal reserve banks consists of gold or gold certificates.

Up to the present time very little recourse has been had to the Federal reserve banks by the member banks, the amount of discounts and the issue of Federal reserve notes being very small. There is no necessity, however, at the present time for such assistance on the part of the Federal reserve banks, except in certain portions of the country, but within a few months undoubtedly these banks will be drawn upon to a very large extent by the member banks.

The fear has been expressed that the Federal reserve banks will have difficulty in earning enough money to pay their expenses and the dividends on their capital stock. I believe this fear to be groundless; but, if it were not groundless, it would not mean that the Federal reserve system is a failure. The founders of the system established these banks not to make money, but to serve as helpers of the member banks, and through them to insure to the people of the United States security, stability, and reasonable rates for advancements and accommodations through discount and open-market operations.

How far the system has already gone in helping the people of the United States will be seen from the fact that just prior to the opening of the reserve banks the rates on commercial paper in the large financial centers were 6 per cent or over and very difficult to obtain, while in other parts of the country they were much higher. At the present time, however, these rates have declined at least 25 per cent and everything points to more nearly uniform rates of discount over the whole country.

Much has been said about the true function of the Federal reserve banks. Some claim that they are purely emergency banks, while others seem to feel that they are ordinary commercial banks which should at all times compete with the member banks. Neither of these extremes, however, represent the real function of the Federal reserve banks. Their duty is not alone to meet emergencies, but, so far as possible, to prevent emergencies from arising; and while ordinarily they do not and are not intended to compete with commercial banks, yet occasions may arise where such competition, through the exercise of their open-market powers, will be necessary for the protection of the people of the United States. It is often said that the Federal reserve banks are bankers' banks, but this is true only to the extent that they deal primarily with the member banks. Their true function, however, as above stated, is to protect the interests of the people, acting through the banks primarily, but whenever necessary acting outside of the banks.

The power of fixing the discount rates which has been vested in the Federal reserve banks, subject to review and determination of the Federal Reserve Board, is a power which must be exercised for the benefit of the whole people, and the final responsibility for its exercise rests with the Federal Reserve Board.

From time to time complaints are heard as to the operation of the Federal reserve banks. Some bankers claim that they lose interest on reserve deposits in Federal reserve banks, which prior to the establishment of the system were deposited with reserve agents; also that they lose interest on the capital of the reserve banks furnished by them. A slight reflection, however, will show that these complaints are more imaginary than real, for the lower reserves established under the act has released a very large amount of cash, and this cash would sustain banking operations which will produce a profit far above any possible loss of interest on their capital or reserve deposits.

It should not be forgotten, moreover, that the stockholding banks are entitled to 6 per cent interest on their investments for the capital of these banks, and, as I have before stated, I do not doubt but that this interest will be earned.

Complaint is also made as to some of the regulations which have been issued by the Federal Reserve Board, especially those relating to discounts of commercial paper. It has been the constant effort of the Federal Reserve Board to simplify its regulations, and new regulations have been issued covering commercial paper which I believe will do away with many, if not all,

of the objections heretofore raised. The board appreciates that the custom of merchants must be cautiously changed and should not be subjected to a sudden disarrangement.

Another important question which is before the board is the admission of State banks into the Federal Reserve System. Complaint has been made that the State banks once having joined the system can not withdraw. On the other hand, it is pointed out that the system established is a national system, and that such a system could not exist if its integral parts at any time could withdraw at will.

The question of regulations to be enacted on the matter of admission of State banks has already given rise to many differences of opinion. Some of the national banks contend that the State banks should divest themselves of all powers not given to national banks as a condition of entering into the system. On the other hand, many of the State banks claim that they have the right to enter the system with all their powers except those which are expressly cut down by the Federal reserve act itself.

The Federal Reserve Board is fully conscious of the importance of the task assigned to it, and it is giving careful attention to all the problems which have arisen, with a view to carry out the system loyally, not only in form but in spirit.

I believe that the system will be of the greatest advantage to the people of the United States and will establish the United States on a solid foundation, which will in the near future make it the center of the world's financial exchanges.

Anglo-American Situation.

EXTENSION OF REMARKS

OF

HON. SIMEON D. FESS,

OF OHIO,

IN THE HOUSE OF REPRESENTATIVES,

Friday, February 19, 1915.

Mr. FESS. Mr. Speaker, I take advantage of the privilege granted me yesterday to say something about the Anglo-American relations as especially affected by the critical situation of neutrals upon the sea.

Much surprise is indulged over the attitude of the English mind in the manner in which the English public first received the President's note of December 26. It is spoken of as the "English shock" over the unexpected communication. Many of the English newspapers were outspoken in their dissent. The Globe assumed an attitude of hostility in language approaching an insult:

> The voice of the great neutral nation which seeks to be the final arbiter in civilization is raised for the first time, not on any question of higher morality, but to express impatience at the fact that the greatest war in the history of the world has interfered with the opportunities of American traders to make money out of the necessities of belligerents.

Many of the English public urged the Government to pursue such policy as will in its judgment best aid the allies in their struggle regardless of the wishes of the United States. While this does not seem to be the attitude of the Government, it is well to scrutinize the rush of events since the publication of the note. The mild character of the note of the President, which had no suggestion of hostility to England and which did not deny the right of search for contraband goods, but which at most was merely "come let us reason together over the situation," could not be taken as an offense save by the type of statesmen or country which believed the sea belonged to the nation strong enough to command it. The note merely cautioned against unnecessary delay and the danger of acting upon mere suspicion and of holding all goods that might be upon the sea in fear that they might ultimately reach a belligerent.

While the British preliminary reply was couched in the most respectful language, it will be noted its tone took a decisiveness that could leave no doubt of its meaning.

In the meantime the episode of the *Greenbrier* further suggested what the British Government regarded as its rights upon the sea. Her attitude on the *Dacia*, in which she may confine her activities within her international rights as defined by international law, is a further announcement of her intentions to forfeit no advantage she may have as the mistress of the sea. While she would not likely go to the extent of such aggression as to offer protest to any pending legislation before the American Government, she would not likely hesitate to state her position if consulted by proper authorities, even at the expense of consistency in her insistence to do herself what she now questions our right to do in matters of transfers on the sea. Her decree November 4, to take effect the next day, placing the North Sea under a state of blockade, together with her order to seize and search all vessels carrying conditional contraband, such as the *Wilhelmina*, now in her courts, indicates her determination in such matters. Her attitude following the German order for the Government to take possession of all foodstuffs to reach German ports to be distributed by the German Government, and her treatment of the later German decree of a blockade of the British Isles, and her use of the American flag upon the *Lusitania*, an English merchant vessel, while in the zone of war, all taken together render the situation precarious.

The final reply of Earl Grey to the President's note, published yesterday, on the day the German decree was to take effect, leaves no doubt as to the purpose of Great Britain to lose no advantage upon the sea.

England's attitude on questions of this sort has ever been somewhat arrogant, especially in her relations with the United States. This attitude was the direct cause of the War of 1812. Fifty years later it dangerously approached another war, when she permitted the building of the Confederate vessels, the *Alabama*, the *Florida*, and the *Shenandoah*, in English shipyards, and allowed them to be equipped by Englishmen, to sweep American commerce from the sea. Not because of her enmity toward America, but rather as a part of a program to control the seas, she will not mildly give up any advantage without protest.

Even prior to the second War of Independence, when Jefferson endeavored, and finally succeeded in the Tripolitan War, through Commodores Morris and Decatur, in driving piracy from the seas, at least one statesman of the mother country declared it would be an advantage to English commerce to have such vessels afloat. They could not seriously disturb English shipping, but they could disastrously harass her competitors on the sea.

It is unfair to recite this fact as an indication of her position to-day, save as a mere item in the evolution of England's position as "mistress of the sea." The blockade of the cotton ports during the war seriously affected some of England's industries. When our Government protested against her assistance in blockade running, and especially against her equipping the Confederate States in ships, Lord John Russell made answer for his Government, in which he declared that to build a ship was the undoubted right of every Englishman. To set sail with a party to a foreign country was equally the right of all. To ship cannon and munition of war to foreign destinations is also a right of Britons. When the ship, and the party, and the cannon, and munitions, after leaving British waters, come together and coalesce into a Confederate cruiser, the British Government may feel deceived and flouted, but it can not be held responsible for inefficiency. It was upon such an argument that the English Government escaped damage for all assistance rendered the Confederacy save that for which the Geneva arbitration allowed in the *Alabama* claims adjustment five years after the close of the war.

The story of the steps by which England has come to her position of primacy on the sea is an interesting recital. The control of the sea is an achievement which most nations, ancient and modern, have at times dreamed about. When Columbus found a new world, that rank belonged to Portugal. In time it passed to Spain. Holland came near to it. In this great national game the two nations which figured most prominently since the famous revolution of 1688 were France and England. These two countries resorted to the test of arms for the prize. The first great try out was what we know as the first intercolonial war, commonly known as King William's War, in 1689–1697. The last and final test was the fall of Napoleon in 1815. During the 126 years from the first to the last test of strength seven wars were fought between the contestants, the shortest 7 years in duration and the longest 12. Within this period 64 years were spent in actual fighting.

While the superficial student will define the cause as a difference over the question of succession, he who looks beneath the surface will see in all of these tests of arms a struggle for the sea. Three of these wars have special significance in this light—that of 1739–1748, commonly called King George's War; that of 1754–1763, commonly known as the French and Indian War; and that of 1775–1783, the American Revolution. All these, and especially the last two, have great significance to the people of the United States.

The war of 1754–1763 was the most important step up to that time to all concerned. It was the first stone of the building to be known as the American democracy. While it was largely a struggle between two European monarchies, it resulted in mak-

ing way for the Anglo-Saxon Republic, built upon a free state, free church, and later a free school. It was the abandonment of the last hope of a French or Latin ecclesiasticism in the New World. What France lost the future United States gained. France revealed her anticipation of this in her famous dictum, "We called a new world into existence to redress the balance of the old." Within a dozen years, 1775, the conflict began to fulfill this decree. While the War for Independence was not between England and France, it signified much to both in their struggle for the sea. While it was the loss to France of her most valuable possession in the New World in 1763, she was still possessed with a vast territory, yet to be bartered, in 1803, to the young Republic, that the great rival might not later claim it—the Louisiana country. What France lost to England in 1763 England lost to the soon to be erected young Republic of America just 20 years later.

But while England lost her American holdings, she gained her East Indian Empire and began her career in the Far East. This world contest for the sea included, as readily observed, the policy of colonization. When the final test came, and Europe's greatest military genius met his fate at Waterloo, only to be consigned to St. Helena, England took command of the sea, which by a consistent policy she holds to-day unchallenged. A maritime map which shows the world's trade routes would graphically reveal the marvelous genius of the builders of this commercial country. The English routes of trade, comprising ports, coaling stations, ships—merchant and defensive—fortifications, cables, and all that enter into the world of commerce, touch every nook and corner of the trading world. A water-bound country, she mans her vessels with sailors as to the manner born. Her flag floats to every breeze on land and sea.

While Great Britain is domiciled on a small island west of the channel, the British Empire counts within her domain the greatest expanse of territory as well as the largest population of any country on the globe. Her colonies are found in every quarter of the earth and her islands in every sea. Her influence in modern progress is felt throughout the world. Her flag not only stands for the English language, customs, laws, institutions, and a specific civilization, but it is a signal for a national honor and dignity that is distinctively British.

Much more appropriate to-day than when it was first uttered by Webster might it be said:

> England's morning drumbeat is heard 'round the world, and the strains of her martial music, keeping company with the hours, encircle the globe.

To attain this world prominence this country had to know the habits and customs of all the peoples with whom she dealt. She therefore has grown the most cosmopolitan people of the globe. Her representative is found plying his trade with every nationality known to man. Her lines of commerce touch every port, ply every ocean, thread every bay, inlet, and strait, and touch every continent, making of the hemispheres but a neighborhood.

This intimacy exposes her to misunderstandings, charges of bad faith, and the use of strong-arm methods. Often complications arise, especially in times of war, over rights of neutrals. Too often England's position of primate on the sea leads her to conduct that smacks of arrogance and overlordship. This has been the attitude frequently taken with the United States, and is distinctly so in the present instance, especially of that portion of the English public which lives under the spell of or is unduly influenced by a commercial bully or swaggerer. Even to question the right of the mistress of the ocean in a business peculiarly her own is an insult to some members of the nation.

This is not the first instance. A hasty review will enumerate many similar occasions of notes of international import and the excitement entirely disproportionate for the importance of it. The treaty of Paris, which recognized our independence, was largely a decision on her part to let us alone by declining to have further dealings with us. This decision was doubly demonstrated by the shabby treatment accorded our early accredited ministers at the Court of St. James. John Adams would be a good witness here. It was further expressed by our efforts which ended in the Jay treaty of 1796, which subjected these Americans responsible for it as trucklers to England. It was further displayed by the conduct of the English minister, Mr. Merry, who was finally recalled at the request of President Jefferson after he had violently offended the President's sense of courtesy. Our insignificance in the eyes of the mother country at that time was further published by the enforcement of the English order in council, of especial significance to-day, and the treatment of the *Chesapeake* in 1807 which led Jefferson to issue the famous embargo act, and later Madison to issue the nonintercourse act, which together almost destroyed our commerce on the sea. During the period England was warring with France she all but completely closed all American ports. She was persistently pursuing a policy which meant war with us.

The greatest case of violation of American rights grew out of the English slogan, "Once an Englishman, always an Englishman." England's naval policy was built upon the two claims—the right of search and the right of impressment. The first permitted the entrance of a belligerent upon any neutral vessel to search for English seamen, and the second permitted the taking from the vessel, to be impressed into the English Navy, such persons as were alleged to be English citizens. One vicious rule adopted by the Government declared all persons who spoke English to be English citizens, subject to impressment, unless they had with them papers to prove the contrary. In this way more than 5,000 American citizens were impressed into the British Navy. To contest this principle the second war of independence was fought. That war revealed America upon the sea a rival worthy of England, and while this country compelled the English to make a treaty of peace at Ghent December 24, 1814, yet the American commissioners did not secure a surrender of this principle on the part of England. She succeeded in an agreement to cease war with no mention of its cause. This remained an open question for nearly 30 years, to be finally surrendered, after a battle of the diplomats, in 1842, in the Webster-Ashburton treaty. The letter of Mr. Webster to Lord Ashburton, August 8, 1842, is one of the most important in our diplomatic history. At least one sentence in this letter has become classic:

> English soil, English territory, English jurisdiction is the appropriate sphere of English law. The ocean is the sphere of the law of nations, and any vessel on the seas is by that law under the protection of the laws of her own nation and may claim immunity, unless in cases in which that law allows her to be entered or visited.

Thus this delicate issue was at last adjusted amicably after 50 years' contention.

Strange as it may seem, although we are closer to England as a nation than any other, we have had more estrangements, more serious differences with her than with any other country, indeed with all other countries together. It may be explained upon the basis that members of the same family are more apt to quarrel and fight than strangers. This is partly explained by the fact that England's trade activity, her most sensitive nerve, touches this Nation at every point of interest which invites conflict; and partly because members of the same family, speaking the same language, observing the same customs and laws, enjoying the same institutions, are most apt to know what each is doing and saying, and therefore can most easily be prejudiced one against the other.

A good example is furnished by the Monroe doctrine. There is little doubt while this is an American doctrine it was suggested by the English minister, Mr. Canning. It was thought best for both America and England. The first serious contest over it was with England in 1850, which was finally adjusted in the Clayton-Bulwer treaty. Even then England did not fulfill the agreement for 10 years later. During all the years of our national concern from the Clayton-Bulwer treaty of 1850 until the Hay-Pauncefote treaty of 1901, during which time we wished to obtain the conceded right to build the interoceanic canal, England contended against us. Even the treaty of 1901 admits of serious controversy over its real meaning. In 1887, and again in 1895, the Monroe doctrine was quoted to induce England to submit the Venezuela boundary dispute to arbitration. The reply of Salisbury in the latter case created the most acute situation between the two Governments since the episode of 1861, when Mason and Slidell were taken from the British steamer *Trent*. In the latter case Lincoln surrendered the envoys on the ground that it was an exercise of the principle of the right of search against which we fought in 1812.

England's answer to America's request which quoted the Monroe doctrine as the basis of the request of 1895 declared the Monroe doctrine was not now nor ever had been international law, no matter how brilliant the statesmen who announced it nor powerful the nation that backs it. To this answer President Cleveland made answer by asking Congress for authority to appoint a commission to investigate the disputed boundary, and recommended that the findings of the same be backed by the power and authority of the Nation. The acute situation created so suddenly over an insignificant boundary line aroused a public opinion in both countries which made it comparatively easy for England to reconsider her former position and agree to an adjustment, which was reached without further strained relations. Now England asks whether we will invoke the same doctrine against Germany's invasion of Canada if she attempts it.

Some of our most serious differences arose out of boundary disputes. A glance at the northern boundary reveals her success in diplomacy. The wording of the treaty of 1783 touching the boundary between what is now Maine and New Brunswick,

was indefinite. It had been a matter of dispute, at times acrimonious, until 1842, when it was finally adjusted peacefully by the Webster-Ashburton treaty. Many Americans hold that the St. Lawrence rightly belonged to the United States. The northern boundary line was for years in dispute, and finally it reached the acute state when in 1844 it became a campaign slogan in "Fifty-four Forty or Fight." England won in this contest. Note her water advantage in the Northwest. At the same time we were having serious differences over what is now the Northwest, then called the Oregon Territory. Both countries had grounds for their respective claims which were pushed with vigor. Both the boundary and Oregon disputes were settled amicably. The boundary line was fixed at 49 degrees, with England in possession of Vancouver with its wonderful harbor, and shipping rights in the Gulf of Juan De Fuca, while Oregon fell to the United States. Here as elsewhere our country did not appreciate with England water privileges. The latest boundary dispute was that on the Yukon, in Alaska. This difference assumed a serious phase, when finally it was left to a commission which succeeded in adjusting it in an amicable manner satisfactory to both nations.

Another source of unpleasant differences with the mother country, and which involves rights on the sea so cautiously guarded by her, is found in the fishing rights along the borders, especially along the east Canadian shore and west Alaskan shore. These disputes arose over American treaty rights in Canadian waters and English rights in Alaskan waters. The disputed points were new to diplomacy, which made them acute. They have been subjects of diplomatic correspondence, interpretations of treaties and purchase titles, special commissions, and international conferences. Happily most of these questions are either adjusted or in the process of settlement, triumphs of diplomacy.

Another source of more or less estrangement with the mother country refers to our relations to the American continental powers. While this is not strictly maritime, it involves the colonial policy of England. With Canada on our north, we have had most friendly relations, but at times misunderstandings have disturbed this usual friendship. At the close of the Revolution, in 1783, many of the English sympathizers, the Loyalists, either voluntarily went to Canada or were forced to go there by treatment accorded them in the States in violation of the treaty of 1783. This item will insure some bitter feeling against the Republic. Fishing rights as was said at various times presented Canadian questions of contention. Sympathy between kindred peoples played some part in our relations.

In the Canadian rebellion of 1837, sometimes called the Patriot War, much sympathy for the revolt was shown in the United States. Raids from New York were made by defeated insurgents. The steamer *Caroline* was destroyed on the American side by Canadian troops. It was seized, set on fire, and allowed to drift over the Falls of Niagara. At least one insurgent citizen was arrested in New York, which created the most bitter feeling until he was acquitted. Action on the part of our Government prevented further disturbance. Economic questions, purely domestic, had some influence.

Frequent discussions of the tariff issue, which invariably called attention to the commercial boundary line, not infrequently produce a feeling of antagonism. This is especially true of a statesman on either side of the line who mentioned annexation. The late Prof. Goldwin Smith, of Canada, was a stout advocate of the policy of annexation. On the other hand, there are frequent mentions of it by statesmen on this side of the line. Naturally such utterances arouse much opposition.

The question of reciprocity, which virtually was a one-sided advantage to Canada, and which was rejected by the latter, and caused the fall of the most distinguished Canadian leader of half a century, became an occasion of a campaign conducted upon an issue that it was the first step toward annexation. The Speaker of the American House of Representatives was widely quoted throughout Canada in evidence, using an incident in which the Speaker was employing mere jest. No amount of explanation could destroy the effect of the quotation.

Still another incident which led dangerously close to serious trouble between this country and the mother country was the intermeddling with Indian affairs in Florida. Gen. Jackson apprehended two foreign subjects, Arbuthnot and Ambrister, one of whom at least was an English subject, and had one hung and the other shot. This rather high-handed manner of dealing with subjects of a foreign country might have involved us as a nation. It was this incident which Calhoun, then Secretary of War, made a subject of investigation, and which led to the feud between him and Jackson, which was never healed.

England's injecting herself into the Texas affairs in the forties upon the ground of agreement with Mexico to forbid slavery in Texas produced much bitterness in certain circles of our country. The annexation of Texas led to the War with Mexico. England did not interfere either at the time or later when we were in civil war. France in 1863 took advantage of our situation and attempted to establish a French Empire in Mexico in spite of the Monroe doctrine. This led dangerously near to war with France.

We have had about 140 years of national history. During that time we have had many serious disputes with England, but only one war, 1812, in addition to the War of Independence, 1776, when our Nation began. We came dangerously near another in 1861 over the Trent affair. The action of the Lincoln government avoided the conflict. England's malignant neutrality as shown throughout the Civil War in many and various ways would have produced war had the Nation been in a position to offer resistance. Our situation allowed a protest only. As Lincoln declared to Seward, "One war at a time is all we can stand."

The strain in 1895 and the ease with which it was relieved indicates that all diplomatic differences can be amicably adjusted when the parties really wish to reach an adjustment. This acute dispute was confined to officials of both countries and never became an issue of the public in either country.

Our national peace was broken once in 1846 with Mexico, and again in 1898 with Spain. In the former case no outside nation offered interference, but in the latter there was an attempt to present a European concert, when England declined to join, on account of which it reached no further than a mere proposal. England's attitude might be taken as real friendship rather than national advantage in a possible war.

It is but natural that the sensitive question between the two nations is commerce. England is, and by nature must be, commercial. Her power lies in her ability to trade. She is a nation of traders, if she is anything, and therefore is most jealous of that right. If she is the workshop of the world, she is also the barterer of the world. To make herself secure she makes alliances, both offensive and defensive. This indicates a partial explanation of her attitude toward Germany, which is rapidly becoming a competitor of no mean ability. It throws some light upon her alliance with Japan. It may explain her permission for Japan to mix in the present trouble. It explains her attitude toward the old claim of the right of search and her extreme sensitiveness over the present issue. It explains her contention that almost approaches arrogance to stop all vessels of neutrals upon mere suspicion, to search for contraband goods, and her insistence upon her right to hold goods that might ultimately reach a belligerent. It partially explains the English "shock" over the note of the Government, with the sanction of the President, notwithstanding it had been a matter of negotiation for weeks before. It probably will explain the ultra utterances of the British press over our silence in the European war when we are urged to lodge protests against the triple alliance for alleged violation of the rules of war. It throws light upon the newspaper indictments that the people of the United States are willing to violate neutrality in order to find a market for our goods for the sake of profit. Can this be a note of fear that England's situation may see another mistress of the sea?

It would be enlightening if the authors of these charges would consult the conduct of their own Government during a war of other nations, which becomes for her, as a neutral, the greatest period of prosperity as the carrying nation of the world. This has been true for decades. Belligerent countries' disturbance of commerce has always been England's opportunity as the carrier on the sea. She does not protest against the shipping of contraband, but insists upon the rights of war to seize contraband on the seas is merely a prize for the country that commands the ocean. Even to-day, involved in war as she is, the allies control the sea, which enables her to ply her trade and advantage free from seizures. Hence her present contention. If the vessels of the Triple Alliance can be driven from the sea, so much the more will be the business of the vessels of the mistress of the sea; so much the more her need to exercise the right of search. Her periods of growth upon the ocean are contemporary with the disarrangement of the trade of other countries. The history of the growth of her trade proves this statement. Hence the jealousy with which she guards her commercial monopoly in time of war and the readiness to halt all vessels of neutrals, including our own, upon mere suspicion. This suggests an explanation of her regard for the future course of the United States as a builder of an American merchant marine. In the days preceding the Civil War our vessels plied every sea. One serious effect of that national strife was the advantage England seized upon, not only to aid the Confederacy to break the southern blockade, to permit the building and equipment of

Confederate cruisers to sweep the seas, but also to embrace the crisis of the Union as an opportunity to clear the seas of an American merchant marine, by a policy of subsidies and discriminating laws which in 50 years have seen her the monopolist of the seas, with small competition from her once great rival in the merchant marine.

Hence the acrimonious dispatches of a belligerent press; the extravagant utterances of irresponsible politicians; the flamboyant attitude of an element of the English public over our latest note upon our rights on the sea; the certainty that she will test American diplomacy to the limit. Unhappily, the Palmerston and Disraeli type is too readily quoted. The Bright and Gladstone utterances are not so readable and do not, therefore, reach the public so quickly. The jingo is most interesting and too often is taken as the voice of the people.

England's surprise reminds the country of her irritation over our demands in 1863. Even Lord Russell, a fairly conservative statesman, resented our claims, and Cockburn, the English member of the Geneva court of arbitration, was so undiplomatic that foreign members openly rebuked him. It was difficult for the public to understand the attitude of the mother country then, after the *Alabama*, built in English shipyards, coaled in English coaling stations, and manned by English seamen, had captured 57 American vessels and had destroyed over $6,000,000 worth of property, for which the court of arbitration allowed $15,500,000 damages, including some items of other Confederate-built cruisers; and it is difficult for the public not to understand the agitation of the same country over our deigning to call her attention to the interference with our trade under the claim of belligerent rights over neutral vessels. It should not surprise those acquainted with England's policy. In the many cases of acute differences over rights upon the sea, disputes over fishing rights, confusion over boundaries, bad temper over the Monroe doctrine, intermeddling in domestic matters as in the case of the Indians and slavery in Texas, undiplomatic activities of Merry under Jefferson and Sackville West under Cleveland, wiser council has in every case, save one, prevented an open rupture. So it will be during this critical situation, when half the world is at war. Our relation with the mother country should and will be the most cordial unless disturbed by jealousy and bad council. In a peculiar sense we are an England transplanted. Edward A. Freeman expressed it in the title of one of his best books, "Greater Greece and Greater Britain." England was greater Greece and America greater Britain.

This country was originally settled by five nationalities—the English, French, Dutch, Swedes, and Spanish. The latter was on the Gulf, and did not occupy any of the territory of the original thirteen States. The French occupied the region of Canada and the Mississippi Valley, but no part of the original thirteen States. The English Puritan settled New England, while the English Cavalier settled in the Southland; the Dutch occupied New York; and the Swedes Delaware. After an existence of 17 years, the Swedish colony was conquered by New York under the Dutch. Fifty years after the first settlement the Dutch colony was conquered by the English. Thus 30 years before the famous English revolution of 1688 all of the thirteen American Colonies had become English either by settlement or by conquest. Eighty years later France lost her hold to England, and the entire country virtually becomes England transplanted. This does not mean English in blood, but in language, law, government, and so forth. To-day the mother country, with all her English possessions, does not contain much over half the population speaking English that are found in this country.

The real English nation might well be regarded as located on this side of the Atlantic. An English statesman recently declared that had it not been for the unwisdom of the government of George III the capital of the English nation might have been in America. True, our population is composed of elements of all nations, but they speak the English language, enjoy the English common law, live under institutions largely modeled after the English, and possess many English ideals. This Nation has more in common with England than it has with any other country. This may explain the frequent causes of dispute, since we strive for the same ideals.

In a little over a century of national growth we have proved the right to be consulted. We occupy a continent over which are spread half a hundred empire States. We have a wealth that overtops any other nation by one and three-quarters times. We have 25 per cent of the world's wheat, 70 per cent of its corn, 60 per cent of its cotton, 40 per cent of its coal, and 42 per cent of its pig iron. We have more mileage of railroads, twice over, than any two countries of Europe. We have two-fifths of all the banking resources of the financial world, including our own country. New York will become, if not already so, the money center of the earth. We have the ultimate form of government to which Europe, many believe, must come at last. We have the happiest people, best fed, best clothed, best housed, best educated, of all the world. We have the ability and must lend succor to war-ridden Europe. We can support our own and help to support the world's needy. Just now our mission is to induce peace among warring nations. But this duty does not demand our supinely subjecting ourselves, without protest, to needless annoyances from national intermeddlers.

While peace can not be commanded by any nation which permits violation with impunity of the most fundamental rights of sovereignty, so it can not be advanced by a nation which overlooks the rights of its citizens, whether on sea or land, at home or abroad.

Our mission as a peacemaker depends upon our seeing with a vision, unclouded by either prejudice or self-interest, the larger rights of all concerned, and our determination, well understood by all the world, to maintain that position at all hazards, for the sake of Europe as well as America. Our duty here is clear, not to play the rôle of the bully nor the part of the banterer. We must not carry the chip on our shoulder nor invite protest from the belligerents nor carelessly enter upon a policy that leads to international complication. Ours is the sphere of the square deal in the larger sense which we believe will be pursued calmly but with dignity and honor to ourselves and with justice to others, remembering ever that nothing is to be gained by vacillation and uncertainty of policy in matters where the line of duty is clearly disclosed.

The present situation involves all possible questions of neutral rights upon the seas that might arise. The contention on the part of the British Government is in the hands of the three trained diplomats and statesmen of Europe—Asquith, Lloyd George, and Earl Grey—who have attracted much attention for their ability in international matters. Upon the side of the United States the very highest talent in diplomacy available may be put to the supreme test.

Rural Credits.

EXTENSION OF REMARKS

OF

HON. FRANK E. GUERNSEY,

OF MAINE,

IN THE HOUSE OF REPRESENTATIVES,

Friday, February 19, 1915.

Mr. GUERNSEY. Mr. Speaker, the question of rural credits is being brought into prominence in the country and will probably receive considerable attention in the Sixty-fourth Congress. Already the matter has been considered by a subcommittee of the Committee on Banking and Currency of the House, which held extensive hearings on the subject during the second session of the Sixty-third Congress.

These hearings dealt almost exclusively with rural land credits. Recently the Committee on Banking and Currency of the House reported favorably to the House a resolution creating a commission to investigate and report by December next the subject of personal rural credits so that the next Congress will have before it a large volume of information on the subject of land and personal rural credits from the standpoint of this country, and in addition the report of the United States commission, which, in April, 1913, sailed for Europe to investigate the question of rural credits and learn what views they could relative to handling such credits in the Old World.

That commission, whose chairman was Senator DUNCAN U. FLETCHER, studied the subject most thoroughly, and a report of the commission has been admirably digested by Mr. Fred G. Swett, of the Department of Commerce. I believe this condensation of the report to be so useful to the people of the country interested in the matter, and especially to Members of Congress whose time may be so taken up that they find it impossible to review the whole report, that I will take advantage of the right granted me to extend my remarks by including therein the digest of the United States Commission on Rural Credits by Mr. Swett, which is as follows:

The report of the United States Commission to investigate and study in European countries cooperative land-mortgage banks, cooperative rural-credit unions, and similar organizations and institutions devoting their attention to the promotion of agriculture and the betterment of rural conditions, has recently been made public. This commission is composed of United States Senators DUNCAN U. FLETCHER, of Florida, chairman, and THOMAS P. GORE, of Oklahoma; Congressman RALPH W. MOSS, vice chairman; Col. Harvie Jordan, of Georgia; Dr. John Lee

Coulter, of Washington, secretary; Dr. Kenyon L. Butterfield, of Massachusetts; and Dr. Clarence J. Owens, of Washington.

In pursuance of the provisions of the act organizing this commission, its members sailed for Europe in April, 1913, where they visited Italy, Hungary, Austria, Germany, Denmark, Belgium, Holland, France, England, Wales, Scotland, and Ireland. While in these countries leading authorities on agricultural matters, farmers, and landholders were visited and conditions carefully investigated and studied. After the return from Europe the commission compiled and edited a great mass of detailed information which was obtained by its members while abroad. The conclusions reached are presented in the report of the commission on agricultural credit, which just recently has been made public.

Agricultural credit naturally divides itself into two great classes, namely, long-term or land-mortgage credit, which may be briefly defined as "credit to meet the capital requirements of the farmer," and short-term or personal credit, which may be defined as "credit to meet the current or annually recurring needs of the farmer." In the European system of agricultural banks the distinction between these two classes of credit is sharply drawn.

To meet the requirements of the two classes separate institutions are provided, differing fundamentally in their plan of organization and operation. These different institutions, however, naturally touch at many points. They have grown up by a slow process and have been adapted and adjusted to meet conditions as they arose. They still preserve their separate identity, and their operations are largely confined to their separate fields. Whether the conditions in America demand a segregation of institutions designed to meet these two classes of credit, as is the case in European countries, or whether one class of institutions can be designed to meet both needs, has been a matter of serious consideration and study by the commission. The differing conditions in Europe and in the United States must, of necessity, have some bearing upon any decision that may be reached on this point. A knowledge of the work of the present American banking system in its old form and as modified by the Federal reserve act in furnishing long-term, or land-mortgage, as well as short-term, or personal, credit for farmers is also necessary as a preliminary to reaching any decision on this point.

In considering this question the commission has attempted to define, in the first place, the needs of the American farming population in a financial sense. As noted above, a careful consideration of this point has resulted in its defining these needs as being two in number, as follows:

NEEDS FOR LARGE SUMS.

First. The farmer's capital requirements, by which is meant the need of the farmer for large sums of money to be used in aiding to pay the purchase price of the farm, in improving his farm, such as erecting new farm buildings, draining, irrigating, or clearing, or in equipping the farm so as to bring his operations to the highest state of efficiency.

The money needed for these purposes must be in the shape of a more or less permanent investment, or in the shape of loans extending over such a long period of time that they can be gradually reduced and paid off out of the increased earnings derived from the improvements made or the equipment added by the farmer with the proceeds of such loans. This is generally referred to as long-term or land-mortgage credit.

Second. The farmer's temporary or annually recurring requirements by which is meant the money needed by him to finance his operations during the time that the crops are being produced. These temporary requirements recur every year and embrace the financial needs of the farmer for the purpose of preparing the land, sowing and cultivating the crops, and harvesting the same. This is generally referred to as personal or short-term credit. But the short-term credit of the farmer should be distinguished from the short-term credit of the merchant or manufacturer.

The merchant requires banking accommodation for 30, 60, or 90 days, during which period he can dispose of the stock acquired and repay the loan; in contrast, the farmer may require short-term credit extending from the time the crops are planted until they are harvested, and this may be fixed approximately at from 90 days to one year. After the crops are harvested and stored in a barn, elevator, or warehouse the need of agricultural banking is largely removed, as the financial handling of the crops so stored then comes under the province of commercial banking.

The questions therefore to be considered resolve themselves into the methods of furnishing for the farmer long-term or land-mortgage credit and short-term or personal credit. For convenience in discussing these two systems of credit, long-term or land-mortgage credit will be hereafter referred to as mortgage credit, because such credit necessarily must be based on the security of the land owned by the farmer and because such mortgage credit for convenience must be again subdivided into long-term mortgage credit and short-term mortgage credit.

LAND-MORTGAGE OR LONG-TERM CREDIT.

Mortgage credit, organized into a special system of banking, has existed in Europe since the reign of Frederick the Great. Beginning in Prussia, this system of banking has grown until mortgage institutions have been organized under authority of law practically in every European State.

One general principle which underlies all mortgage banks of Europe is the issue of bonds which are based on the collective value or security of many individual mortgages on real estate. It is the merging of the credit demands and the property resources of many individuals, somewhat similarly situated, into one financial transaction. States, municipalities, counties, and other organized communities in the United States have adopted this principle. Public improvements of all kinds are commonly constructed from the proceeds of bonds issued against the total taxable wealth of a political division and are sold in the open markets. These bonds are justly popular and have made possible the construction of many mighty works of civilization.

SHORT-TERM AND LONG-TERM MORTGAGES.

Mortgage credit is generally divided into short and long term loans. This distinction is based upon the duration of the loan and also upon the method of repaying the principal sum. Short-term loans are defined for the purposes of this article as those made for a shorter period than five years, the principal being repayable at the maturity of the loan. All loans exceeding five years are classified as long-term loans, the principal sum being repayable in small annual or semiannual payments. The latter method of repayment is technically known as amortization.

The issue of land-mortgage bonds and the method of amortization payments are the distinctive features of European long-term mortgage credit which should be preserved in any American system of land-mortgage banking. Under this plan the duration of a loan is determined by the rate of amortization, while the interest charge is fixed by the market value of the bonds and the bank's charge for administration. If 4 per cent bonds are selling at par and the bank charges thirty-five one-hundredths of 1 per cent for administration, then an amortization rate of fifty one-hundredths of 1 per cent will extinguish the debt in 54½ years; that is to say, the borrower will pay the bank a rate of 4.85 per cent on the sum borrowed for 54½ years.

The bank divides this payment into three parts; 4 per cent goes to pay the interest due on the collateral trust bond which the bank issued to secure the money which was loaned to the farmer; fifty one-hundredths of 1 per cent is applied toward the payment of the principal, and the bank receives thirty-five one-hundredths of 1 per cent for expenses and profits. If the bond sells below par, either the farmer must pay a commission to the bank or the discount must be met by the bank from its administration fund; on the other hand, if the bonds sell above par, the premium may go to the borrower or to the institution in the form of profit.

Generally speaking, the interest rate to the borrower is determined by the market value of the bank's collateral trust bonds, generally referred to as land mortgage bonds, the rate to the borrower rising as the bond falls below par and lowering as it advances above par.

If the rate for amortization is higher than fifty one-hundredths of 1 per cent, the loan will necessarily be extinguished in a shorter period than 54½ years.

A limitation as to time is usually fixed by law as well as to the rate which the bank may charge for administration. In actual operation in Europe the time limitation varies in general from 30 to 60 years, and the charge for administration varies from fifteen one-hundredths of 1 per cent in a purely mutual association of borrowers to thirty-five one-hundredths of 1 per cent in joint-stock banks. The French law allows a margin of sixty one-hundredths of 1 per cent, as does the recently enacted Spanish law. This charge is computed on the principal sum remaining unpaid, and in long-time loans it is therefore a constantly decreasing charge to the borrower.

These rates of payment for interest, amortization, and administration are definitely fixed in the terms of the mortgage and can not be changed by the bank. The borrower, however, is always given the right to discharge his obligations at any interest period after a fixed time. This period is commonly designated in Europe as 10 years. This right is a double protection to the borrower: First, it protects the debtor against any demand for payment of his entire debt or an increase in the annual interest charges; second, the provision for repayment at pleasure gives the borrower complete protection against a general fall in interest rates. This will be a very important feature to American debtors, since the tendency in the United States will be toward lower interest rates for farmers.

Under such a contract a borrower could safely assume a liability maturing regularly over a long period of time, because if interest rates were to fall he could borrow money elsewhere at the lower rate of interest, discharge his obligation, and thus secure the advantages of a cheaper rate on money.

TAX EXEMPTIONS.

The report states that it can not be denied that taxation by a State of the mortgage and of the real estate on which the mortgage is predicated is double taxation. A farmer can not with safety go in debt for 60 per cent of the value of improved real estate and pay taxes on both the land and the mortgage. President Taft, in his letter to the governors of our States, asserted that farmers are paying higher interest rates than any other class of business men. It can be asserted with entire confidence that they are also paying a higher taxation in proportion to their property holdings than any other class of citizens.

In the Middle West, where land values range from $100 upward per acre, if the land be mortgaged for 50 per cent of its value, and if the mortgage is taxed, the debtor owner is investing $50 per acre and paying interest on $50 per acre. He is also paying directly the tax on the land and paying indirectly the tax on the mortgage. Under these conditions—rising land values and cumulative taxation—the land is slowly but surely passing away from resident ownership to landlord ownership. Farm tenancy is undeniably on the increase.

One of the leading purposes of a rational system of mortgage credits is to enable any honest, industrious agricultural laborer or tenant to acquire, by a part payment of the purchase price, immediate control and ultimate ownership of a tract of land and thereby check the growing evil of tenancy. At the same time the system should enable any owner of agricultural real estate to secure capital on terms which will enable him to improve his holding and to render his land more productive. In either instance the terms must be such as to prevent temporary crop failure from driving the owner from his farm and from causing the loss of all savings. These are worthy purposes, and they will promote in the largest and best sense the general welfare of the Republic.

Under the American form of government these important matters are under State sovereignty and are subject to State legislation. Every student of the subject must conclude that the States should adopt some system of State guaranty of title, as, for instance, the Torrens system. It is against the best interest of the general public to have possible legal disputes over the ownership of land. The loss incident to such uncertainty falls primarily on the landowner, but in the end this loss is transferred to the general public because the food and shelter of the Nation is secured from the soil. It is a recognition of this economic fact which justifies and sustains wise legislation to promote the best interest of agriculture. European Governments have generally recognized this fact. The same may be said of Australian and Canadian Provinces. Some American States have taken it up.

THE AREA OF OPERATION.

The considerations discussed in the first part of this article naturally suggest the State as the unit for the operation of a mortgage bank for agricultural credit. The laws of a State are uniform. The value of an issue of collateral trust land-mortgage bonds by bank depends on a correct valuation of the mortgaged lands; and long-time loans involve a supervision or oversight as to the management of the property to prevent depreciation in the security. These very important features can be arranged most advantageously if the operations of the bank be restricted within a reasonable area. Moreover, European experience indicates that mortgage banks succeed best when confined to a limited area. Some of the American States approach in area many of their largest nations; hence it is probable that a State is the largest political division against which a series of collateral trust bonds should be issued by a mortgage bank.

There are other restrictions which should be imposed on mortgage banks. Their resources should always bear a fixed ratio to their liabilities. The earlier mortgage banks in Europe were permitted to issue collateral trust bonds up to 20 times the amount of their capital and surplus. The tendency has been to reduce this volume to 15 times their resources, which would seem to be a better ratio. At this proportion banks have reported to this agricultural credit commission that they were declaring annual dividends at from 12 per cent to 14 per cent, so that no just complaint can be made on the basis of earning power.

The capital and surplus of the mortgage bank should not be entirely invested in long-term mortgage loans, but should be invested in other securities. The resources of the bank may very properly be advanced in loans for short periods, pending an issue of its collateral trust bonds, or they might be temporarily invested in its own securities. The full success of a mortgage bank can not be assured unless a market is always present for its bonds. The desirability of a security, from an investment standpoint, does not depend wholly on the rate of income; the question of a ready cash market at a fixed value—its convertibility into cash at the will of the holder—is an important feature of an investment. The land-mortgage bond is an invention to render liquid the value of real estate, and therefore the bank which issues these collateral trust bonds should be prepared to repurchase them when they are offered on the market. Much of the capital of the bank should be available for this purpose and should not be tied up in long-time loans.

COOPERATIVE BANKS.

The general spread of cooperation among the farmers of the United States should be fully recognized and every opportunity should be given for the growth of these cooperative principles. In the judgment of the commission any legislation providing for the establishment of land-mortgage banks should authorize the establishment of cooperative as well as private joint-stock institutions. Any attempt to force all institutions into one form would probably fail. There should, however, be no differences in the methods of doing business, the only difference being in the form of organization.

The American people are so thoroughly accustomed to the principle of double liability that no attempt advantageously could be made to reduce it. Mortgage banks organized by farmers are likely to be small at first in many parts of the country, and for that reason, if for no other, it would be wise to authorize these to assume any amount of liability desired by the members. Having in mind the effect upon the selling value of the bonds in the open market, it might be wise to emphasize the advantage of assuming a much higher liability. Greater liability than that generally approved in the country at the present time should not, however, be required.

The only difference in organization prescribed by law would be: (1) Cooperative banks would be required to limit the number of shares of capital owned by each member, while the other banks would make no limitations; (2) in cooperative banks each member would have one vote, and only one, no matter how many shares of stock he owned, while in other banks each share of stock would have one vote; (3) in cooperative banks, after a small rate of interest had been paid, the remainder of the net earnings, if any, would be distributed among the patrons on the basis of business done, in contrast with the distribution of all net earnings in the form of dividends on capital stock in the other institutions. Under the plans suggested there is no reason why any group of farmers in any county should not organize its own institution on cooperative principles. It would also be thoroughly practicable for any larger group of farmers already organized for other purposes (such as a State grange, union, alliance, or equity society) to form a large central State institution on cooperative principles, with all the strength of similar institutions found in the various European countries visited by the commission.

THE MATTER OF STATE AID.

There is room for an honest difference of opinion as to the question of State aid if only European experience is consulted.

In every instance in Europe where Government capital has been granted to establish mortgage credit the results have been favorable to the agricultural interests of that nation. It is the opinion of the commission that such aid should not be extended in the United States. The farm property in this country is computed to be worth $40,000,000,000 and is rapidly increasing in value. Undoubtedly this vast property, whose value is as stable as the foundations of this Government, is sufficient to attract capital in ample volume to improve and cultivate its area without subvention from our Government Treasury. The idea of Federal aid is always attractive and commands many able and earnest advocates, but self-help should be the motto of the new American agriculture.

It is a mooted question whether these mortgage banks should be chartered by the States or the Nation. There can be no question but that it is a subject entirely appropriate for the State legislatures. If the question could receive serious consideration from every State, and fairly uniform legislation were to be enacted without undue delay, it is to be conceded that this would be a happy solution, but the experience in this country in the effort to secure uniform legislation regarding negotiable instruments, divorce laws, etc., has demonstrated the difficulty of securing uniform State legislation by independent action. Moreover, it is true that the investing class in the United States seems to place more confidence in Federal than in State supervision of financial institutions. Whether this confidence is justified or not, the fact remains the same, and certainly any system which increases the confidence of the investor in the securities to be issued is worthy of serious consideration.

Land-mortgage bonds, when issued under rigid Government supervision, form an ideal kind of investment or trust security, because they bear a fair rate of interest, command a ready market, and exhibit great stability of value. All speculation is avoided by restricting mortgage banks to the granting of loans to private owners of land and, when such loans are granted, to the issuing of collateral trust bonds only to the amount of the loans. The capital of the bank is required to be invested chiefly in other safe interest-bearing securities, and this remains as an additional security to the holders of the bonds. Under these conditions such bonds are of the highest type of absolutely safe investment. Their value in nowise depends upon speculative elements and varies but little, presenting a favorable contrast with railway and commercial stocks and bonds.

In the opinion of the commission the National Government is fully justified in extending a generous recognition to these bonds because they are issued to aid and develop agriculture. All commercial banks, savings banks, insurance companies, and other like institutions should be permitted and encouraged by State and Federal legislation to invest their funds in these bonds; both State and National Governments, as well as private enterprises, should receive these bonds as approved collateral in all transactions, including like securities. The Government may not justify the use of public funds to promote purely private enterprises, but the people are beginning to comprehend that the Government itself is a cooperative enterprise.

CONCLUSIONS.

Day by day the power of the whole people is being employed to do more cheaply or more efficiently some duty which had hitherto been performed by the individual. In agriculture we have been a pioneer people, actively engaged in taking possession of the surface of a great empire. Our farmers have been engaged in the hard labor of improving their farms, building schoolhouses and churches, and constructing bridges and roads for the public welfare. Science has but recently informed us that the fertility of our soils must be maintained and where depleted must be restored. We all know that our herds of meat-bearing animals must be increased, says the commission in its report.

While it may be said that these duties pertain particularly to the individual farmers, it can be answered in reply that farmers have not been able to accumulate sufficient free capital to meet the present situation. Our population has grown more rapidly than our agriculture has been able to expand on a scientific basis. It has been possible for our railroads and other highly organized industries to look forward to the future and estimate the rapidly growing demands of the public on their services. And yet, in many directions, we can see that our population has outrun the ability of our public-service corporations to serve them efficiently.

Agriculture has been the one great national industry which has been without organization and has been absolutely helpless before the wonderful growth of our Nation. Therefore, the financing of our farms has become a national problem. The savings of the Nation must flow out to the farms in order to put agriculture on a proper basis as compared with other organized industries. This can only be done by wise and patriotic legislation. Farm securities must be honored by Nation, by State, and by individual. Fortunately, everybody will profit by such cooperation. The investor—from the smallest creditor to the largest capitalist—can purchase a security which has been thoroughly investigated by a bank under strict Government inspection, and which, in addition, is guaranteed by the capital of the bank. He has secured a bond which is practically as safe as a security can be. The owner of the property has been equally accommodated, since he can readily secure a loan on his property up to 50 per cent of its value. The general public will be greatly benefited, because the cost of living will always be predicated upon the great law of supply of foodstuffs produced from the earth and the volume consumed by the people who inhabit the earth.

There should be no hesitation, therefore, in enacting legislation which will give land-mortgage bonds—which are the basis of all true long-term rural credit—that favorable position which is always accorded State and Federal bonds, for both are based on the public wealth and are issued to strengthen and to perpetuate our Nation.

In closing this section of its report the commission desires to refer to the fact that the commercial world has had constructed for it a magnificent system of commercial banks; the frugal laborers and savers of the cities have their systems of savings banks and building and loan associations, and the great corporations have their trust companies. All of these and other similar financial institutions assist in the financing of the agricultural industry to some extent, but none of them is adequate or can be made adequate to supply this special need without a sacrifice to their present field of endeavor. The commission recognizes that too great ease in borrowing should not be encouraged, since this might result in an unreasonable increase in farm debt. On the other hand, it should not be forgotten that under the present system tenancy continues to increase and farmers have outstanding obligations easily exceeding $2,000,000,000 secured by mortgages on their farms, much of which was negotiated under very unfavorable circumstances and with very high rates of interest. It is believed that under the plans which have been here detailed, and which are intended to be supplementary to the existing system, tenancy may be decreased, the needs of farmers be taken care of, and at the same time the outstanding obligations may be refunded on much more favorable terms and gradually reduced by the regular payment of small annual installments, impossible under the general system now found in this country.

PERSONAL OR SHORT-TERM CREDIT.

From all information that the commission has assembled on the status of personal or short-time credit for farmers in the United States it is clear that very different conditions exist in different parts of the country. In some it is perfectly clear that farmers have most of the institutions necessary, so far as personal or short-time credit is concerned. In all parts of the country farmers patronize, to a greater or less extent, small and medium national banks, small and medium State banks, as well as private banks. To a considerably smaller extent they patronize and are served by loan and trust companies and savings banks, both mutual and stock.

In addition to these regularly established and recognized financial institutions, farmers also patronize extensively individual lenders. Farmers both borrow and lend as individuals to individuals, and also borrow from individuals other than farmers to a considerable extent, and possibly lend in some cases. Then, too, farmers depend upon the local stores and representatives of commission houses and other buyers of farm products and dealers in farm supplies for credit to a very large extent.

One of the first very definite and fundamental observations which must be accepted as a result of an examination into the characteristics of financial institutions in this country which serve farmers, so far as credit is concerned, is that they were not constructed to serve the special needs of the farmers. Because the financial institutions have not been constructed to serve the special needs of the farmers, other institutions, such as stores of all kinds and persons who are the purchasers of and dealers in farm products, often have been forced to furnish the financial aid necessary.

PEOPLE'S BANKS.

Most European countries have recognized the different needs of the different classes of people, such as merchants, manufacturers, farmers, etc., and different institutions exist to serve the different classes; and yet it is true that in several countries there is one type of institution which to a very large extent serves the different classes, thus demonstrating that it is not absolutely essential that separate and distinct institutions exist.

The most important type of institution of this class is that popularly known as the people's bank. The best illustrations are found in Germany, Austria, and Italy, but some other countries have institutions quite similar in many if not most respects.

This particular institution developed in Germany, where it is popularly known as the Schulze-Delitzsch type of bank. It is described first because it resembles in many respects the small private, State, and

national banks found in many parts of the United States. It is quite probable that slight changes in American national banking laws would make it possible for the small banks of this country to extend their activities so that they might serve the same purpose in the same way that these banks now serve the farmers of Germany, Austria, Italy, and other European countries.

SHARE CAPITAL.

The people's banks in different European countries secure their first capital by the issuing of shares; these shares are owned by the members. In the different countries visited the general impression was that the value of the shares was rather high. In 740 of these banks in Germany, which are affiliated with the national federation, the shares are of a nominal value of approximately 300 marks, or $71.

It is not necessary that the shares be paid for in one sum, however, the general arrangement being that members may pay for them in monthly installments. Toward payment for the share or shares subscribed by a member are placed, in addition to the monthly installment, any dividends which becomes due to him on a division of the profits. Only when the share is fully paid up does he receive such dividends in cash. The prospect of receiving dividends in cash incites the members to make every effort to complete their payment in the least possible time and thus become the actual owners of capital, even though it be on a modest scale.

In Austria the same general condition is found, except that the value of the shares is lower than is found in Germany and the average paid-up capital per member is naturally lower. Of the 2,862 Schulze-Delitzsch banks, which furnish particulars of their working condition, in Austria in 1910 the membership was 1,704,090 and the share capital only $38,400,000, the average paid-up capital per member being only about $23. In Italy the total number of members of the 690 people's banks reporting was 501,022, while the paid-up capital, including surplus, amounted to $30,042,152, or an average of $60 per member.

LIABILITY.

One of the most important characteristics of the people's banks is their status with reference to the liability of the members. Under any system of cooperation the general understanding is that mutuality is accepted as the foundation; in other words, that unlimited liability is accepted by the members and that each member pledges himself to be liable to the full extent of his resources for all accounts of the society to which he belongs. This principle has been found to be practicable where all of the members live in close proximity to each other and are generally known to each other. This has been particularly so where all are engaged in the same general line of work and are of the same general economic status. More particularly do the principles of unlimited liability obtain successfully where membership is quite definitely limited to a comparatively small number and where the members are carefully selected.

In the case of these popular banks they are urban in character, generally speaking, although probably about one-fourth of the members are farmers. In the second place, the occupation of the members ranges over a great variety of callings; and, in the third place, the membership is quite large, in fact, so large that generally it would be impossible for any one member to know any large per cent of the other members. As a result of this, although these banks started as unlimited liability societies, they have gradually changed in many respects. Thus, in 1911 out of a total of 952 banks of this type which reported in Germany, 563, or 59.1 per cent, were of the unlimited-liability type, while 385, or 40.5 per cent had limited liability, and 4, or 0.4 per cent, were of a special mixed type, having unlimited liability to make supplementary payments. The general tendency is in the direction of limited liability, but although the system of limited liability is steadily increasing, unlimited liability is still considered the best system on which to establish these popular banks in districts which are not yet familiar with cooperative credit. The system of unlimited liability seems to work particularly well when the societies are just beginning and while the membership is small and the members acquainted with each other.

In Austria, out of the 3,599 banks of this type reporting in 1912, only 603 were based upon the principles of unlimited liability, while 2,996 had adopted the principles of limited liability. In Italy, like Austria, the liability of the members is limited.

WORKING CAPITAL.

According to the report furnished by the 1,051 popular banks of Germany, at the end of 1911 the aggregate working capital was $397,045,535. This is an average of $377,776 per bank. The average per bank is rapidly increasing, as shown by the fact that the average for all banks reporting in 1886 was only $146,846; that in 1898 it was $190,400; and in 1902 it was approximately $238,000. The average working capital per institution is nearly three times as great as it was 20 years ago.

The experience of these institutions in Germany for the last few years is that it is possible to attract a very large capital from outside sources in the way of private deposits by the payment of a reasonable interest, while, on the other hand, it is a much slower and much more difficult proposition to accumulate working capital by increasing the membership and increasing the share capital or reserve funds.

In contrast with Germany the total share capital of the 2,862 popular banks which reported in Austria in 1910 was $38,400,000, an average of $13,417 per institution. The reserve for these same institutions amounted to $21,800,000, an average of $7,617 per institution.

LOANS AND INVESTMENTS.

It is just as important to examine into the loans and investments or the credit side of the balance sheet as it is to examine into the working capital or debit side of the balance sheet. A brief analysis of the use made by these popular banks of the funds at their disposal should therefore be made.

The principal object of these people's banks is to supply credit for their own members, and therefore one would expect that they would limit themselves to the particular work of granting loans under varying forms to the membership. The fact that loans are, as far as possible, strictly limited to the membership is one of the most important, if not the most important, reasons why the membership is so large and why the average paid-up capital is so small. It is impossible, however, to make the funds on hand in banks exactly balance the demands for credit by their members. It is therefore necessary, when the working capital supplied by the paid-up share capital, surplus funds, and deposits are insufficient, to borrow money from outside sources, and it is equally desirable, where the working funds referred to exceed the demand of the members, to seek outside fields of investment. It is also desirable to create a surplus fund for the safety of their own operations in case of insolvency of their members or the sudden withdrawal by the members of their deposits. Naturally this surplus would not be loaned to the members, but would be invested elsewhere.

In Germany all loans to members are referred to as loans, while loans to other types are referred to as investments. According to the credit side of the balance sheet of the 1,051 people's banks in Germany in 1911, 82.9 per cent represented outstanding loans to members, while 17.1 per cent represented loans of other kinds referred to as investments.

The total amount of loans of these German banks at the close of the year 1911 was $332,012,602, or an average of $314,950 per institution. In contrast it should be noted that the loans outstanding at the end of the year 1910 for 2,862 Schulze-Delitzsch banks of Austria which furnished particulars was $397,000,000, or $138,714 per institution. It should be noted also that the total amount of loans granted during the year 1911 for the 1,051 popular banks of Germany was $1,106,165,207, which is an average of $1,052,488 per institution. In the case of the 2,862 Austrian banks, the total amount of loans granted during the year 1910 was $417,400,000, or an average of $145,842 per institution.

A study of the rules governing loans and investments shows that in the case of fixed-period loans a guaranty is almost universally demanded. Only in the most exceptional cases are loans granted without guaranty. Of the aggregate fixed-period loans less than 2 per cent are in this class. The guaranty usually demanded is either a special guaranty in the form of pledges or a personal guaranty in the form of surety. Loans on personal guaranty form 86.7 per cent of the total loans for fixed periods. Only 11.4 per cent is advanced with pledges as guaranty.

From the fact that more than seven-eighths of all loans for fixed periods are secured by personal guaranty, it is clear that these popular banks are serving the needs of the particular classes of persons for whom they were originally established; that is to say, persons who are in a position to furnish security necessary for doing business with ordinary banks.

The borrower may give as receipt for the debt his simple note of hand or an "accommodation bill." The employment of bills in this connection is one of the characteristics of the Schulze-Delitzsch system, the desire being to train the debtors of the banks to habits of punctuality in business and at the same time to simplify the collection of the interest.

Finally, the popular banks, having familiarized their customers with the use of bills, have succeeded in diffusing the business of bill discounting. As a general rule the loans are fixed at 90 days. This term may be extended by renewals which, however, are generally conditional on the repayment in cash of at least 10 per cent of the amount. At each time that bills fall due, after a small amount has been paid a new bill is created for the lower amount. Thus the members of the banks become accustomed to the payment of their obligations by installments. They also are accustomed to punctuality in their dealings, and payment is made more easily.

The popular banks of Germany and other European countries, much like the national banks of this country, do not have at their disposal capital adapted to the form of investment represented by mortgage and other land-credit instruments, and as a result only 9.4 per cent of the loans and investments represent mortgage and other land credits.

PROFITS AND LOSSES.

The officers of the International Institute of Agriculture at Rome, in referring to the Schulze-Delitzsch banks of Germany, stated: "They accumulate a considerable quantity of capital and they distribute fairly high dividends." In the matter of dividends, indeed, the Schulze-Delitzsch banks differ very little from the various kinds of commercial banks in the United States.

In order to illustrate this point, reference might be made to the fact that the gross profits realized in 1911 by the 1,051 banks reporting was practically $21,420,000. Out of this, however, approximately $11,900,000 were paid in the form of interest on capital from outside sources. The gross profits represented 5.29 per cent of the total working capital. The total amount of interest, however, paid on borrowed working capital represented only 3.86 per cent of the total working capital. It will thus be seen that the institutions secured their working capital at a comparatively low rate, and they are thus able to work on a margin of interest which allows them a very satisfactory profit without pressing unduly on their debtors.

The cost of management during the year 1911 was about $3,332,000, being 16.27 per cent, or about one-sixth of the gross profits. This, however, was only 0.09 per cent of the total business done. After all expenses had been paid, including interest on all borrowed capital, general expenses, depreciation, and all losses, the net profits remaining, which included the balance from the preceding year, amounted to $5,236,000. This is 8.45 per cent of the share capital, showing a very satisfactory result.

All of the net profits are not distributed by the Schulze-Delitzsch banks, which are very anxious to bring their reserve up to a very high level. Of the net profits, 29.7 per cent, therefore, was placed in the reserve fund in 1911. In addition to this large proportion placed in the reserve, a considerable amount was also expended in aid of propaganda work which is carried on, such as the publication of literature, the employment of organizers, etc. This would be an unheard of thing in the business of banks in the United States. But, further than this, a considerable part of the net profits was donated by the banks for works of public utility, and a considerable amount was also distributed among the several employees in the form of a bonus. Thus these popular institutions recognize employees not on a strictly profit-sharing basis, but recognize them in such a way as to share with them the net profits. Only about 60 per cent of the net profits, which in 1911 amounted to $3,094,000, was distributed in the form of dividends.

A recent investigation showed that a considerable number of persons become members without any view of borrowing, but merely for the sake of investing their savings in shares of stock in order to get the high rate of interest. Shares are frequently as high as $375, but inasmuch as the shares may be partly paid in at the beginning and gradually paid in completely, this is no obstacle. Dividends of 6 and 7 per cent are not uncommon, and this is a decided incentive for persons to become members.

Although these institutions distributed only 6 per cent of the net profits in 1911, 753, or more than two-thirds of the banks reporting, distributed dividends ranging from 5 to 7 per cent. When compared with the rate of interest charged the borrower and the rate of interest paid on deposits, this seems to be a very satisfactory business basis.

An examination of various extremes shows that two banks distributed dividends of only 2 per cent, but on the other hand 14 banks reached 10 per cent, one bank paid a dividend of 18 per cent, and another a dividend of 25 per cent, thus showing that some of these institutions are extremely profitable.

What has been said with reference to the situation in Germany applies with practically the same force to the other countries where this

type of institution is found in existence. Without going into any considerable amount of detail, it is worth while to note that in Italy the dividends on paid-up capital averaged nearly 9½ per cent during the years 1880–1882. Since that time the share capital has gradually increased in proportion to the working capital, and as a result dividends on paid-up capital have not been quite so high. They are still high, however, averaging in every year for which complete reports were obtained nearly if not quite 7 per cent, and in some years during the last decade averaging over 8 per cent.

It is seen, therefore, that the small American national banks, together with a very large number of State and private banks, differ only in minor details from the people's banks of Europe. The real important difference is the fact that the people's banks of Europe have adapted themselves much better to the needs of farmers and grant loans extending over a sufficient period of time so that farmers are able to patronize them, and that they get thoroughly satisfactory results.

RURAL CREDIT UNIONS.

It is not at all likely that the present system of National, State, and private banks and trust companies, even if the recommendations made by this commission are adopted, will properly take care of all the needs of all farmers for short-term or personal credit. There are in the United States nearly, if not quite, 6,500,000 farms at the present time. Of these only about 4,000,000 are operated by owners and managers. In the whole country more than 800,000 farms are less than 20 acres in size. Some of these are intensively cultivated and their operators doubtless have definite connections with banks, but most of them are probably not recognized in the regular banking associations of the present day. At the same time, hundreds of thousands of farms larger than 20 acres in size are operated by farmers who have no direct relation with the present banking system. It is very probable that only a small proportion of the two and one-third million tenants have regular banking connections. Institutions to meet the needs of these operators of small farms and these tenant operators must be seriously considered.

In addition to these, it should be noted that during the average year approximately 3,000,000 farm operators employ labor. These laborers should have an opportunity to open bank accounts, but their business is so small that they do not at the present time have any bank connections. All told there are literally millions of the farm population in the United States who have not at the present time any banking relation worthy of note. The needs of this type of farmers and farm laborers have been taken care of very largely in European countries by small institutions, popularly known as Raiffeisen societies, credit unions, credit associations, credit societies, etc. Institutions similar to these are needed in the United States; if not in every State, at least in the great majority of States; and if not in every community, at least in many communities.

MEMBERSHIP AND AREA OF OPERATION.

During the last three decades credit unions, under various names, have increased rapidly in number in Europe. Indeed, prior to 1880 the number was very small, and the system not well known, but at the present time farmers in all parts of Europe understand credit unions and talk in terms of credit unions as readily as farmers in the United States talk in terms of corn or any other farm product. In Germany alone there are at the present time probably 17,000 of these societies, while 20 years ago the number was only about 1,700. This is representative of the change that has taken place in other countries as well.

The first information concerning these institutions was brought to Italy in 1880, and a few years afterwards a credit union was started. At the present time there are more than 2,000 in Italy. In Austria the movement started in 1886, and credit unions have been increasing rapidly in number ever since the first one was established; at the present time there are about 8,000. The credit union is a well-known institution in eastern Canada, where large numbers of societies have been established. In some parts of the United States farmers are already talking in terms of credit unions, and students of the subject have commenced to urge their establishment, but as yet the movement is rather new.

Turning now to the question of membership it should be noted that the average number of members per bank in Germany is approximately 100. Thus in Germany probably 1,700,000 farmers belong to credit unions.

Until 1876 credit unions were established without any share capital. In that year the imperial law of Germany compelled all cooperative societies to have foundation capital, and as a result German rural credit unions since that time have had small amounts of capital stock. In order to keep away, however, from the capitalistic idea, the shares were placed at the very minimum price, and generally speaking even yet the maximum price of shares is only about $2.50. In some regions the average paid-up share capital per member is only $1 or $1.50.

LIABILITY.

The principle maintained by the credit unions throughout the early period of their development was that of unlimited, joint, and several liability of all members. It is true that the principles of limited liability are found more and more in many other forms of cooperation throughout Europe, but all authorities urge that the principles of unlimited liability be maintained in connection with the credit unions. At the present time 92 out of every 100 credit unions in Germany continue to maintain the rules of unlimited liability, while only 8 out of every 100 have adopted limited liability.

The whole purpose of this important rule is to prevent the misuse of the loans by compelling members to keep an eye upon one another and see that loans are not abused. At the same time this rule gives the credit unions the confidence of the public, and, since these little societies depend upon the public for deposits as working capital, the confidence of the public must be secured and maintained.

WORKING CAPITAL.

It has already been pointed out that share capital is a very unimportant part of the total working capital of the credit unions of Europe. To this may be added the statement that the reserve fund also is a comparatively unimportant part of the total. But compared with the share capital the reserve holds a very important place. Thus in Germany the reserve funds are more than twice the share capital. This statement will be better understood when reference is made to the fact that profits or net earnings are generally turned into the reserve fund and not distributed to the members.

The most important source of the working capital is found in deposits on current account and savings deposits. Just as share capital is a more important feature in popular banks, so private deposits are a more important feature when credit unions are under consideration. These observations pertain chiefly to Germany, Austria, and Italy. Just as the popular banks secured more or less of their working capital from outside sources, so, too, the credit unions depend upon the outside to keep the margin necessary for satisfactory business operations.

In Germany as a whole probably less than 10 per cent of the total working capital comes from transactions with outside institutions, showing in contrast with some other countries how largely these small credit unions are self-managing and self-sufficing societies. They depend almost entirely upon the local deposits to take care of the demands for money or credit.

The popular banks (mention of which already has been made) compare in many respects with the small national, State, and private banks of the United States. The credit unions have as yet practically no counterpart in this country. Thus the total working capital of the average popular bank in Germany was given as not far from $400,000. In contrast, the average working capital of each credit union is only about $40,000. Further comparison shows that the average share capital for popular banks in Germany is between $50,000 and $60,000, while the average share capital for all credit unions is less than $500. Further comparison in detail is unnecessary, since the general statement may be made that the average credit union is about one-tenth the size of the average popular bank. The credit union is the primary unit and is found so thoroughly established throughout Europe that its importance in the financial system can not be ignored. The importance to this country of similar institutions must be apparent, and the detailed description is given only to indicate the position which these societies might hold in the United States.

LOANS AND INVESTMENTS.

The real object of these banks or credit unions is to secure credit and money for the members, and it therefore naturally follows that the capital obtained from the various sources just mentioned is used almost entirely for making advances to members. In institutions where the working capital exceeds the demand of the local community the surplus is devoted to safe, profit-yielding investments, and the common practice is to deposit this chiefly in central institutions. The leading classification of the loans and investments may be best indicated as follows: Loans are made, first, for fixed periods, and, second, on current account. Other assets represents investments, deposits in institutions, etc.

In connection with loans and investments the amount of loans is important, but the period of loans is probably as important as any other feature. Loans to farmers generally must extend over periods from 90 days to 1 year. An examination of the practice of credit unions in Europe shows that loans generally vary from six months to two or three years. More than one-fifth of the loans are on current account, and these probably do not extend for as long a period as six months. On the other hand, more than half of the loans are for fixed periods and extend over a longer period of time. In exceptional cases loans are made for even longer periods than for three years.

A common characteristic of these institutions is the provision that the applicant for a loan must declare the purpose for which it is to serve. In some cases the rules are so strict that if a member applies for a loan for one purpose and uses it for another he must be excluded from membership for a period of time, and upon second offense must be prohibited from ever receiving further loans for any purpose. This rule has proved very efficacious, according to most reports.

PROFITS AND LOSSES.

The purpose of credit unions is not to make commercial profits, but to give credit to members on favorable terms. As generally found throughout Europe, this system does not admit even of any distribution of dividends. Where this rule is in complete force all net earnings or profits are carried to the reserve fund or used in the creation of institutions of public utility or are devoted to the common good. A few of the credit unions, however, and particularly those which have a material share capital, provide for the distribution of dividends; but even in these cases rules are very strict, and the dividends never exceed the maximum rate of interest charged the borrower. In Austria the profits are never paid in the form of interest on shares, except in the very rarest cases, being placed in the reserve almost always, although in some cases small amounts are devoted to the common good. The same general rule applies in the case of Italy and other European countries.

The fact that no dividends are paid, or that when dividends when paid are insignificant, does not mean that these credit unions are not prosperous. Taking Germany again as an illustration because of the fact that Germany has literally thousands of these societies, it is found that the great majority close their business each year with a respectable fund designated "net earnings." Out of 12,797 credit unions, 11,795, or more than 92 out of each 100, closed the last fiscal year for which reports are available with net earnings, while only 911, or 7 out of each 100, declared a loss. Ninety institutions closed their business for the year with a balanced sheet, showing neither profit nor loss.

Taking the total result of all these credit unions under consideration, the net earnings, after subtracting losses, amount to not far from $2,000,000 for one year, or almost 30 per cent of the share capital of these institutions; but, as noted above, this is not declared in the form of dividends on the share capital, and, as a matter of fact, when the total working capital is considered, these profits represent only about 0.4 per cent, showing what a narrow margin the institutions consider safe.

SUMMARY.

A careful examination of the descriptions of these European banks or credit unions suggests the questions, Are these institutions necessary in this country; and if so, should they be provided for by law, or is any legislation necessary?

The members of the commission feel that such institutions are necessary in many, if not all, country communities in the United States. We will not take space or time here to establish this position, believing that it represents the unanimous opinion of farmers and of unbiased or unprejudiced observers acquainted with the problem.

The members of the commission are of the opinion that credit unions could be organized in almost every State in the Union, if not in every State, without specific legislation, as they were organized in many European countries and as they have already been launched in several American States. At the same time it is believed that legislation clearly defining credit unions, their scope, their functions, their methods of operation and limitations, as well as a system of inspection or supervision of these institutions, is eminently desirable.

The members of the commission are agreed that it is clearly within the power of the different States to pass the necessary legislation, and we desire to call the attention of Congress to the specific laws of Massachusetts, New York, Wisconsin, and Texas providing for credit unions within those States.

Assumption of Risk Under the Federal Employers' Liability Act.

EXTENSION OF REMARKS
OF
HON. FRANK BUCHANAN,
OF ILLINOIS,
IN THE HOUSE OF REPRESENTATIVES,

Wednesday, February 17, 1915.

Mr. BUCHANAN of Illinois. Mr. Speaker, never yet has the Congress of the United States, acting under its legislative authority, enacted a law to promote the welfare and better the conditions of the great masses of the people of our country, the working people, but what the big business interests, who would thereby be molested in their methods and process of plundering the people, have dragged that law through every conceivable form of litigation in the various courts of the land, first testing its constitutionality, and, failing in this, introducing every possible defense to see just how far they could divert its provisions from what was intended by its makers; and the success, Mr. Speaker, with which they have met in their efforts to this end at the hands of our judiciary is even more astonishing than the gall they have displayed by their open defiance of the legislators of the Nation.

One of the most striking examples of how these special interests have been able to pervert the laws on our statute books is found in a number of decisions by our Federal courts under the Federal employers' liability act approved April 22, 1908. It was to overcome the inadequacy of the common-law rules of recovery for accidents and the injustice of the system of employers' liability suits based upon negligence, allowing such defense pleas as contributory negligence, assumed risks, defects in appliances, and fellow-servant fault, and thereby "promote the safety of the employees and to advance the commerce in which they were engaged," that this law was enacted. However, I regret to say that the interpretation that its provisions have received by a number of our courts have very much impaired the law in this regard and should impress upon all of us the necessity of further legislation along this line in order to provide already long-delayed justice to a worthy class of semipublic servants.

I desire to insert here an article appearing in the December, 1914, issue of the Harvard Law Review, by Mr. Edward P. Buford, of Lawrenceville, Va., under the title "Assumption of risk under the Federal employers' liability act," which I am sure will throw a great deal of enlightenment on this matter:

ASSUMPTION OF RISK UNDER THE FEDERAL EMPLOYERS' LIABILITY ACT.

On April 22, 1908, Executive approval was given to the act of Congress known as the Federal employers' liability act, which, stripped of its verbiage irrelevant to this discussion, is as follows:

"That every common carrier by railroad while engaging in commerce between any of the several States * * * shall be liable in damages to any person suffering injury while he is employed by such carrier in such commerce * * * for such injury * * * resulting in whole or in part from the negligence of any of the officers, agents, or employees of such carrier, or by reason of any defect or insufficiency, due to its negligence, in its cars, engines, appliances, machinery, track, roadbed, works, boats, wharves, or other equipment.

"SEC. 3. That in all actions hereafter brought against any such common carrier by railroad under or by virtue of any of the provisions of this act to recover damages for personal injuries to an employee * * * the fact that the employee may have been guilty of contributory negligence shall not bar a recovery, but the damages shall be diminished by the jury in proportion to the amount of negligence attributable to such employee: *Provided*, That no such employee who may be injured * * * shall be held to have been guilty of contributory negligence in any case where the violation by such common carrier of any statute enacted for the safety of employees contributed to the injury * * * of such employee.

"SEC. 4. That in any action brought against any common carrier under or by virtue of any of the provisions of this act to recover damages for injuries to * * * any of its employees, such employee shall not be held to have assumed the risks of his employment in any case where the violation by such common carrier of any statute enacted for the safety of employees contributed to the injury * * * of such employee.

"SEC. 5. That any contract, rule, regulation, or device whatsoever, the purpose or intent of which shall be to enable any common carrier to exempt itself from any liability created by this act, shall to that extent be void. * * *." (The constitutionality of this statute was sustained in Mondou *v.* N. Y., N. H., & H. R. R. Co. (223 U. S., 1, 50) (1912), upon the following ground:

"The natural tendency of the changes described is to impel the carriers to avoid or prevent the negligent acts and omissions which are made the bases of the rights of recovery which the statute creates and defines; and as whatever makes for that end tends to promote the safety of the employees and to advance the commerce in which they are engaged, we entertain no doubt that in making those changes Congress acted within the limits of the discretion confided to it by the Constitution."

In that case the court also said:

"We are not unmindful that that end was being measurably attained through the remedial legislation of the several States, but that legislation has been far from uniform, and it undoubtedly rested with Congress to determine whether a national law, operating uniformly in all the States, upon all carriers by railroad engaged in interstate commerce, would better subserve the needs of that commerce."

In Michigan C. R. Co. *v.* Vreeland (227 U. S., 59, 66 (1913)), it is said:

"We may not piece out this act of Congress by resorting to the local statutes of the State of procedure or that of the injury. The act is one which relates to the liability of railroad companies engaged in interstate commerce to their employees while engaged in such commerce. The power of Congress to deal with the subject comes from its power to regulate commerce between the States. Prior to this act Congress had not deemed it expedient to legislate upon the subject, though its power was ample. 'The subject,' as observed by this court in Second Employers' Liability Cases, 'is one which falls within the police power of the State in the absence of legislation by Congress.' * * * By this act Congress has undertaken to cover the subject of the liability of railroad companies to their employees injured while engaged in interstate commerce. This exertion of power which is granted in express terms must supersede all legislation over the same subject by the States.")

In Seaboard Air Line Railway *v.* Horton (34 Sup. Ct., 635, 639 (1914)) the court held that "by the phrase 'any statute enacted for the safety of employees,' Congress evidently intended Federal Statutes such as the safety-appliance acts and the hours-of-service act"; and then proceeded to place upon the fourth section the following interpretation:

"It seems to us that section 4, in eliminating the defense of assumption of risk in the cases indicated, quite plainly evidences the legislative intent that in all other cases such assumption shall have its former effect as a complete bar to the action. And, taking sections 3 and 4 together, there is no doubt that Congress recognized the distinction between contributory negligence and assumption of risk; for, while it is declared that neither of these shall avail the carrier in cases where the violation of a statute has contributed to the injury or death of the employee, there is, with respect to cases not in this category, a limitation upon the effect that is to be given to contributory negligence, while no corresponding limitation is imposed upon the defense of assumption of risk—perhaps none was deemed feasible."

The doctrine of assumption of risk, which the court thus engrafts upon the statute, is a common-law doctrine by which the employee, guilty of no fault, was denied recovery, notwithstanding his injury resulted from a danger created by the employer's negligence, if, after becoming chargeable with knowledge of the danger, he continued in the service without complaint. It is a doctrine against the injustice of which, in its application to modern railroad service, the legislation of the States has been chiefly directed.

If it be true that no question of law is to be regarded as finally decided until it has been rightly decided, the question whether this common-law doctrine is to be construed into the act should still be an open one, certainly until it has received more thorough consideration than was given it in the case of Seaboard Air Line Railway *v.* Horton, supra, or in any other case in which a similar conclusion has been reached. The question is vital. Its decision necessitates a judicial determination of the character and purpose of the act, whether the legislation was in furtherance of the policy evinced in the legislation of the States or is, in fact, a reactionary measure designed to displace State legislation to the extent that the abolition of assumption of risk by the States had inured to the benefit of employees of interstate carriers.

If the present trend of judicial decision shall be adhered to, it is obvious that the act is worse than nugatory, so far as concerns any beneficial result to interstate employees, in comparison with the rights secured to them under State legislation, which the act supplants; and that the act, viewed as a regulation of interstate commerce, with this destructive principle of the common law engrafted upon it, so far from having a tendency "to promote the safety of the employees and to advance the commerce in which they are engaged," in fact relegates the subject to the crude and artificial rules of the common law, except as to that comparatively small class of "defects and insufficiencies" which result from the violation of statutes enacted for the safety of employees.

The hours-of-service act does not deal with instrumentalities. The safety-appliance acts cover only a part of the appliances used in connection with "cars and engines." The common-law immunity to the carrier from the consequences of its own negligence would therefore be reinstated as to everything of a physical nature embraced in the comprehensive terms "machinery, track, roadbed, works, boats, wharves, or other equipment," and even as to "cars, engines, and appliances," except to the limited extent to which appliances to be used in connection with cars and engines have been prescribed by statute.

Judicial construction that thus makes the system of Federal liability a legal hybrid, partly statutory and partly common law, rests apparently upon the theory that the act does not "cover the subject," and that what is regarded as an omission in the act is to be "pieced out" by recourse to the common law. In other words, the conclusion reached in Seaboard Air Line Railway *v.* Horton, supra, is a departure from the principle stated in Michigan Central Railroad Co. *v.* Vreeland, supra.

Since, also, Seaboard Air Line Railway *v.* Horton originated in the State of North Carolina, where assumption of risk has been abolished by statute, it is difficult to perceive from what source the court derived the common-law principle which it applied. Without considering the legal basis or source of authority of the common law as a rule of decision in the United States, the court assumed the existence of a common-law doctrine of assumption of risk, which State legislation is powerless to repeal, and which is available to "piece out" what was conceived to be an omission in the fourth section to deal fully with common-law assumption of risk.

The court apparently assumed that the act of Congress occupies with respect to the common law the same relation as an act of Parliament, and that the liability act, although enacted in the exercise of the exclusive power of legislation vested in Congress by the commerce clause of the Constitution, and as a distinct act of Federal sovereignty, is to be regarded merely as an act amendatory of the common law. And what common law? Not the common law of the State, for the State had abolished the principle which the court applied.

Proceeding upon the assumption of such a common-law principle, which is beyond the power of the State to repeal, the court gave no apparent consideration to the fact that the unconditional liability created by the first section excludes that form of assumption of risk which at common law operates as a bar to recovery when the injury results "in whole or in part from the negligence of any of the officers,

agents, or employees of such carrier, or by reason of any defect or insufficiency, due to its negligence, in its cars, engines, appliances, machinery, track, roadbed, works, boats, wharves, or other equipment."

Before proceeding to a technical construction of the act, or attempting to show that the fourth section, instead of giving rise to a defense in favor of the carrier, in fact extends the liability created by the first section, let us consider the anomalous character of the act with this doctrine of the common law construed into it.

The decision in the Horton case imputes to Congress the inexplicable purpose of imposing the highest degree of liability for failure to comply with statutes enacted for the safety of employees, and, at the same time, of affording immunity to the highest degree of negligence of which the carrier can be guilty with respect to all other instrumentalities not covered by such statutes.

Can any intelligible reason be given why Congress should have intended thus to discriminate between such appliances as driving-wheel brakes, automatic couplers, grab irons, drawbars, running boards, steps, and locomotive ash pans, on the one hand, and bridges, trestles, roadbeds, tracks, ties, machinery, works, boats, wharves, and all other kinds of appliances and equipment, on the other? Can any reason be conceived why Congress, for the purpose of promoting the safety of employees or advancing interstate commerce, should have imposed absolute liability for the failure to equip cars and engines with the statutory appliances, not to be affected by the employee's knowledge of the omission nor to be mitigated by his contributory negligence, and yet, with respect to all other instrumentalities, have given to the carrier the benefit of the common-law defense of assumption of risk with the encouragement to negligence which that defense affords?

The explanation of the provision of the third section, forbidding the defense of contributory negligence even in mitigation of damages, and of the fourth section, forbidding the defense that the risk was one of the assumed "risks of his employment," when the injury to the employee results from the violation of a statute, is that Congress intended to compel compliance with its statutes by forbidding any defense in case of their violation. But, since it is impracticable to regulate by statute the whole matter of the construction, equipment, and maintenance of an interstate railway, to the extent that the character and condition of the equipment is not, and in the nature of things can not be, prescribed by statute, the existence of any "defect or insufficiency" due to the carrier's negligence, from which injury to its employee results in whole or in part, is made the conclusive test of liability.

When such a defect or insufficiency and its causal relation to the injury are shown, the liability is absolute and subject only to mitigation to the extent, to be determined by the jury, that the injury is attributable to the employee's contributory negligence (B. & O. R. R. Co. *v.* Darr, 204 Fed., 751 (1913); G. T. W. Ry. Co. *v.* Lindsay, 201 Fed., 836 (1912); Wright *v.* Y. & M. V. R. R. Co., 197 Fed., 94 (1912); I. C. R. R. Co. *v.* Nelson, 203 Fed., 956 (1913); St. L., I. M. & S. Ry. Co. *v.* Conley, 187 Fed., 949 (1911); P., B. & W. R. R. Co. *v.* Tucker, 35 App. D. C., 123, 220 U. S., 608 (1910); and by the trial court in Pedersen *v.* D., L. & W. R. R. Co., 229 U. S., 146 (1913).)

In the Horton case the court draws the following distinction between "contributory negligence," which the act provides shall not bar a recovery, and "assumption of risk," which the court declares shall bar recovery (supra, p. 639):

"Contributory negligence involves the notion of some fault or breach of duty on the part of the employee; and since it is ordinarily his duty to take some precaution for his own safety when engaged in a hazardous occupation, contributory negligence is sometimes defined as a failure to use such care for his safety as ordinarily prudent employees in similar circumstances would use. On the other hand, the assumption of risk, even though the risk be obvious, may be free from any suggestion of fault or negligence on the part of the employee."

Can any reason be given why Congress should have intended to forbid recovery to an employee guilty of no fault, and yet allow recovery to an employee guilty of contributory negligence, which necessarily implies that he was chargeable with the same knowledge of the danger which resulted in the injury? Or can any reason be given why Congress should have intended to forbid recovery to an employee for merely remaining in the service with knowledge and without complaint, and yet allow recovery to an employee who, with the same knowledge, expressly and for valuable consideration contracted to exempt the carrier from liability?

Besides the policy of the act and the ground of its constitutionality declared in Mondou *v.* New York, New Haven & Hartford Railroad Co. (supra), already quoted, we have the following statement of the court in Pederson *v.* Delaware, Lackawanna & Western Railroad Co. (229 U. S., 146, 151):

"* * * Indeed, the statute now before us proceeds upon the theory that the carrier is charged with the duty of exercising appropriate care to prevent or correct 'any defect or insufficiency * * * in its cars, engines, appliances, machinery, track, roadbed, works, boats, wharves, or other equipment.'"

Is it conceivable that the policy of the act, as thus twice declared by the court, could be more effectually defeated than by introducing into it the common-law defense of assumption of risk as to all dangers arising from defects and insufficiencies, except from violations of statutes? This defense encourages negligence. As observed by Judge Jaggard in Rase *v.* Minneapolis, St. P. & S. S. M. R. Co. (107 Minn., 260, 265; 120 N. W., 360, 363 (1909)):

"The reasoning by which it is sought to be justified, carried to its logical conclusion, tends to result in this paradox: The more grossly the master is negligent the more certain is the assumption of risk by the servant and the master's exoneration. If the master be more careful, then the more doubtful is the servant's assumption of risk, and the more probable is the master's liability. The employer who is successfully careful and he who is extremely careless are equally protected. The exercise of care is discouraged, and a premium is put on negligence."

The doctrine of assumption of risk which thus gives immunity to the employer's negligence and compels the servant, as a last resort, to quit the service and stop the business in order to escape irremediable injury is at variance with the ground upon which the constitutionality of the act was sustained. Such a doctrine had its origin in the relation of master and servant under conditions which affected the interests only of the employer and employee. It is an incubus upon the interstate commerce of the country with the important public interests which that commerce subserves. Under its baleful influence upon commerce in time of peace trainmen, on becoming chargeable with knowledge of the carrier's negligence, must cease the transportation of passengers, mails, and freight, and, in time of war, the transportation of troops as well.

The doctrine of assumption of risk originated in the case of Priestley *v.* Fowler (3 Mees. and W., 1 (1837)). There is no more similarity between the reasons and policy upon which that decision is based and the reasons and policy which called for the legislation embodied in the Federal employers' liability act than there is between a "butcher's van" and the physical equipment of an American transcontinental railway.

It is inconceivable that Congress should have intended to fetter the interstate commerce of the present day with the crude doctrines laid down by Lord Abinger in Priestley *v.* Fowler, which involved the question of liability of a butcher for injury to his servant resulting from an overloaded "butcher's van," doctrines against which many of the courts have protested and the injustice of which, in their application to modern industrial conditions, has brought forth the various acts of remedial legislation in all the countries in which the common law of England has prevailed.

The interstate carriers of the United States are public-service corporations. The commerce in which they are engaged and the instrumentalities by which that commerce is carried on were not conceived of at the time of Priestley *v.* Fowler. On that commerce depend the wealth, the happiness, and the civilization of the country. Employees of interstate carriers are indispensable instrumentalities or agencies in that commerce. The commerce must go on; employees can not stop.

To free commerce from the fetters of the common law—"to impel the carrier to avoid or prevent the negligent acts and omissions which are made the bases of the rights of recovery which the statute creates and defines," and thereby "to promote the safety of the employees and to advance the commerce in which they are engaged" (Mondou *v.* New York, N. H. & H. R. R. Co., supra, p. 51)—was the enlightened purpose of the act and the constitutional justification for this exertion of congressional power. (Senator Dolliver, discussing upon the floor of the Senate the act of Apr. 22, 1908, said: "The public policy which we now declare is based upon the failure of the common law to meet the modern industrial conditions." Senator BORAH, advocating the amendment of Apr. 5, 1910, declared that "it was the intention of Congress in the enactment of this law originally, and it may be presumed to be the intention of the present Congress, to shift the burden of loss resulting from these casualties from 'those less able to bear it' and place it upon those who can, as the Supreme Court said in the Taylor case (211 U. S., 281), 'measurably control their causes.' * * * The passage of the original act and the perfection thereof by the amendment herein proposed stand forth as a declaration of public policy to radically change, so far as congressional power can extend, those rules of the common law which the President in a recent speech at Chicago characterized as 'unjust.'" See also Doherty on Employers' Liability Act, p. 61.)

Before the enactment of this statute there was no Federal law of negligence. The Federal courts in the exercise of their jurisdiction in cases involving liability of railway companies to their employees, whether engaged or not in interstate commerce, applied the law of negligence as a part of the law of the State where the injury was occasioned. This statute, for the first time, creates a substantive Federal right in favor of the employee, distinct from the right theretofore given him by the law of the State. (Thornton on Federal Employers' Liability Act, sec. 1, pp. 4–5, note.)

The system of Federal liability created by the act is exclusive of the law of the States upon the subject, which means that it is exclusive of the grounds of liability available to the employee under the State law, whether common law or statutory, and of the grounds of defense, whether common law or statutory, afforded by the law of the State to the interstate carrier. Just as the employee must look to the act for his cause of action, so the carrier must look to the act for its defenses. Unlike the liability under the law of the State, which originated in the common law and was subject to all the defenses available at common law, the system of Federal liability is purely of statutory creation. The terms in which liability is imposed are exclusive of defenses which would defeat that liability.

There is no common law of the United States except that in the construction of the Constitution and acts of Congress recourse may be had to the common law for the purpose of interpreting the technical terms employed, which otherwise would be unintelligible. (Wheaton *v.* Peters, 8 Peters (U. S.), 591 (1834); Pennsylvania *v.* Wheeling & B. B. Co., 13 How. (U. S.), 518 (1851); Smith *v.* Alabama, 124 U. S., 465 (1888); Moore *v.* United States, 91 U. S., 270 (1875); Gatton *v.* Chicago, R. I. & P. R. Co., 28 L. R. A., 556 (1895).) The common law is essentially the law of the States. It exists as a part of the law of the States by virtue of its adoption by the States, and to the extent only that it is not in conflict with State institutions and is not repealed by State legislation. Although, when the question is one of general and not merely of local jurisprudence, the Federal courts will apply their own construction of the common law, irrespective of the decisions of the States courts, they nevertheless do so in administering the common law as the law of the States. (Smith *v.* Alabama, supra.)

In States which have repealed the common-law defense of assumption of risk (Hough *v.* Railway Co., 100 U. S., 213 (1879)), the defense can not be set up as a bar to recovery in any case, whether arising under the act of Congress or out of purely intrastate service. In cases arising under the act of Congress in States where this defense has not been abolished, the defense is not available, for the reason that the act can not be "pieced out" by the law of the State. In other words, if the act of Congress can not, as is universally conceded, be "pieced out" by legislation of the States repealing the common-law defense, how can it be "pieced out" by State legislation originally adopting the common law, or by this principle of the common law after it has been repealed by the States? In Western Union Tel. Co. *v.* Commercial M. Co. (218 U. S., 406, 416 (1910) Mr. Justice McKenna said:

"We have seen that one division of the supreme court of the State was of the view that if the prohibition rested on the common law its validity could not be questioned. We can not concede such effect to the common law and deny it to a statute. Both are rules of conduct proceeding from the supreme power of the State. That one is unwritten and the other written can make no difference in their validity or effect. The common law did not become a part of the laws of the States of its own vigor. It has been adopted by constitutional provision, by statute or decision, and, we may say in passing, is not the same in all particulars in all the States. But however adopted, it expresses the policy of the State for the time being only, and is subject to change by the power that adopted it. How, then, can it have an efficacy that the statute changing it does not possess?"

From the nature of legislation by Congress, in the exercise of its power to regulate commerce, such legislation is exclusive of the law of the States. The defenses permissible under the act must be found in the express or implied provisions of the act. The question, therefore, is not whether the common-law defense of assumption of risk, as such, is available to the carrier, but whether it appears from the terms of the act that Congress intended to create, in favor of the carrier, a defense similar to that of common-law assumption of risk.

The object of the statute was to create in favor of the employee of a common carrier coming within its purview absolute liability for injury resulting "in whole or in part" from its negligence with respect to its physical instrumentalities, represented by its "cars, engines, appliances, machinery, track, roadbed, works, boats, wharves, or other equipment," or from the negligence of its human agencies, represented by its "officers, agents, or employees"; and to make it negligence per se for such carrier to violate "any statute enacted for the safety of employees." As a corporation can act only through its officers, agents, or employees, such "defects or insufficiencies" as may occur in its physical appliances will necessarily be attributable to its human agencies. The two grounds of liability will therefore overlap each other.

The purpose of Congress to create unconditional liability when the injury results "in whole or in part" from such negligence is manifest from the provisions of the third and fifth sections, "that the fact that the employee may have been guilty of contributory negligence shall not bar a recovery," and "that any contract, rule, regulation, or device whatsoever, the purpose or intent of which shall be to enable any common carrier to exempt itself from any liability created by this act, shall, to that extent, be void."

The provisions of the third section, "that no such employee who may be injured * * * shall be held to have been guilty of contributory negligence in any case where the violation by such common carrier of any statute enacted for the safety of employees contributed to the injury," and of the fourth section, "that in any action brought against any common carrier under or by virtue of any of the provisions of this act to recover damages for injuries to * * * any of its employees, such employee shall not be held to have assumed the risks of his employment in any case where the violation by such common carrier of any statute enacted for the safety of employees contributed to the injury," indicate the determination of Congress to enforce the requirements of "statutes enacted for the safety of employees," by exempting the employee in the one case from the imputation of contributory negligence and in the other from the defense that dangers resulting from such violation were among the "risks of his employment."

The theory that the effect of the fourth section is to adopt the common-law doctrine that the employee by continuing in the service assumed the abnormal risks resulting from a "defect or insufficiency," due to the negligence of the carrier, unless its conduct involved also a violation of a statute enacted for the safety of employees, proceeds upon a misconstruction of the words "risks of his employment," and an inadvertent leaving out of consideration of the relation between the common law of England and legislation by Congress in the United States.

The words of the fourth section, "risks of his employment," mean the ordinary risks inherent in the business—the unavoidable risks which are intrinsic, notwithstanding the performance by the carrier of its personal duties. They do not include the "secondary and ulterior" risks arising from abnormal dangers due to the employer's negligence.

The object of this section was not to adopt by implication the common-law defense of assumption of the risk of such abnormal dangers; its object was in express terms to exclude the defense which before the passage of the act was available to the carrier in determining what are the "risks of his employment" assumed by the employee.

Before the enactment of this statute the carrier might exempt itself from liability under the common-law doctrine of the "choice of methods." The common-law duty of the master was only to exercise ordinary care to provide the servant with reasonably safe appliances. He was not required to use any particular appliance. Independently of the safety-appliance acts, the selection by the master of his appliances was a choice in which the courts would not undertake to control his discretion; it was not incumbent upon him to choose this or that specific appliance, but only to exercise ordinary care to provide reasonably safe appliances. In Norfolk & W. Ry. Co. *v.* Cromer, 101 Va., 667, 671; 44 S. E., 898, 899 (1903), the court thus states the common-law doctrine of the employer's choice of methods: "Court and juries can not dictate to railway companies a choice between methods, all of which are reasonably adequate for the purpose to be subserved"; and this doctrine has been applied to relieve the employer of civil liability even when the injury resulted from a violation of a safety statute. In Nottage *v.* Sawmill Phoenix, 133 Fed., 979, 981 (1904), where the safety appliance act of Washington imposed a penalty for its nonobservance, but contained no language similar to that of the fourth section of the act of Congress, the court said:

"This is a penal statute, enacted by the legislature in the exercise of the police power of the State, and it contains no provision purporting to affect in any way the rules of law applicable to civil actions. It gives no hint of an intention to confer upon injured employees any new right enforceable in an action to recover damages, nor does it express a legislative intent to change the common law by abolishing defenses recognized by the common law."

In Glenmont L. Co. *v.* Roy, 126 Fed., 524, 528 (1903) (contra, Narramore *v.* Cleveland, C. C. & St. L. Ry. Co., 96 Fed., 298 (1899)), which involved a similar statute, in the opinion delivered by Judge Sanborn and concurred in by Judge (now Mr. Justice) Van Devanter, it is said:

"The master is not required to supply the best, newest, or safest appliances to secure the safety of his servants; nor is he bound to insure the safety of the place or of the appliances he furnishes. His duty in this respect is discharged when he has exercised ordinary care to furnish a place and appliances reasonably safe and suitable for the use of his employees. * * * The factory act of Minnesota, which requires employers to guard or fence dangerous machinery so far as possible, does not abolish the defense of assumption of risk. It does not deprive parties of their right to contract regarding the risks of their avocations."

When it is considered that the first section imposes liability only for negligence, the purpose of the fourth section to extend that liability becomes apparent. The word "negligence" is a common-law term. It is therefore to be construed according to its common-law meaning. The act does not make the carrier an insurer of its employee's safety. By the first section it makes the carrier unconditionally liable for the negligence of its officers, agents, or employees and for its negligence with respect to its appliances. But at common law the authorities are in conflict as to whether the violation of a "statute enacted for the safety of employees" is negligence. (5 Labatt on Master and Servant, 2 ed., § 1909.) If it was not negligence—that is, if it involved no breach of duty to the employee—the risk of injury therefrom was a "risk of his employment." To remove doubt on this point and to make the violation of such a statute negligence per se under the system of Federal liability, the fourth section provides that the employee "shall not be held to have assumed the risks of his employment in any case where the violation by such common carrier of any statute enacted for the safety of employees contributed to the injury."

Let us consider more closely the significance of the words "risks of his employment." It is to be observed that the statute nowhere uses the phrase "assumption of risk." The words of the statute are "the risks of his employment," which include only the normal risks incident to the service, not enhanced by the employer's negligence. While the phrase "assumption of risk" in its modern acceptation includes the ordinary risks as well as those due to the employer's negligence, the words "risks of his employment" refer only to the ordinary risks, the existence of which implies no negligence on the part of the master. "The proposition that the servant contractually assumes the risks of his employment," says Mr. Labatt, "of course amounts merely to an assertion * * * of the general principle that proof of negligence on the master's part is a prerequisite to the establishment of the servant's right to maintain an action." (5 Labatt on Master and Servant, 2 ed., § 1547.)

"A proposition which has so frequently been enunciated by the courts as to have become axiomatic is that, prima facie, a servant does not assume any risk which may be obviated by the exercise of reasonable care on the master's part. In other words, the abnormal, unusual, or extraordinary risks which the servant does not assume as being incident to the work undertaken by him are those which would not have existed if the master had fulfilled his contractual duties." (3 Labatt on Master and Servant, 2 ed., § 894.)

The English rule is thus stated by Blackburn, J., in Morgan *v.* Vale of Neath Ry. Co., 5 Best & S., 570, 579 (1864); affirmed in L. R. 1 Q. B., 149 (1865):

"If the master has, by his own personal negligence or malfeasance, enhanced the risk to which the servant is exposed beyond those natural risks of the employment which must be presumed to have been in contemplation when the employment was accepted, as, for instance, by knowingly employing incompetent servants or supplying defective machinery, or the like, no defense founded on this principle can apply; for the servant does not, as an implied part of his contract, take upon himself any other risks than those naturally incident to the employment."

In Texas & Pac. Ry. Co. *v.* Harvey, 228 U. S., 319, 321 (1913), it is said:

"At the common law the servant assumes the ordinary risks of his employment, but he is not obliged to pass upon the methods chosen by his employer in discharge of the latter's duty to provide suitable appliances and a safe place to work, and he does not assume the risk of his employer's negligence in performing such duty."

If full force be given to the maxim "expressio unius exclusio est alterius," as applied to the words of the fourth section, "such employee shall not be held to have assumed the risks of his employment in any case where the violation by such common carrier of any statute enacted for the safety of employees contributed to the injury or death of such employee," what would be the effect of the maxim? It would be that those "risks of his employment" which do not result from the violation of a statute enacted for his safety would remain as the "risks of his employment," which under the act are still assumed, and the existence of which would not imply negligence on the part of the employer. The words "risks of his employment" have a definite meaning distinct from the enhanced risks "due to the employer's negligence." An application of the maxim to one risk of the first class would certainly not justify the implication of risks of the second class.

Courts which hold that the common-law defense of "assumption of risk" is available under the act to bar recovery when the injury is attributable to the employer's negligence have fallen into the error, partly at least, by failing to distinguish between the significance of this phrase and the more restrictive words of the statute, "risks of his employment."

The phrase "assumption of risk" in its original significance embraced only such risks as were inherent, or at least involved no breach of common-law duty. In this sense the risks included are synonymous with those embraced in the phrase "risks of his employment." By subsequent application the phrase "assumption of risk" was extended to embrace the enhanced risks due to the employer's negligence, and thus was made to include two legal conceptions essentially different.

In its original sense, assumption of risk was a bar to recovery because, there being no breach of common-law duty, there could be no cause of action; while in its secondary sense the negligence of the employer gave rise to a cause of action which might be defeated by proof of the employee's continuance in the service with knowledge of the enhanced danger. The essentially different characters of the two defenses covered by the common-law phrase "assumption of risk" are clearly shown in the note to Scheurer *v.* Banner R. Co. (28 L. R. A., n. s., 1207, 1221 (1910)):

"Assumption of risk, as applied to the ordinary risks of the service, is merely a rhetorical phrase used to connote the idea that the master is not an insurer against injuries resulting from dangers which can not be removed by the exercise of due care upon his part. In the second sense, assumption of risk has a vastly different significance; it implies negligence on the part of the master and a prima facie liability, but it also implies a waiver of the effects of that negligence if it injures the servant."

"Assumption of risk," in its original sense, in which the risks assumed are equivalent to the "risks of his employment," except as modified by the act, is an available defense; but "assumption of risk" in its secondary sense, as an "implied agreement" or a voluntary exposure to danger implied in the maxim "volenti non fit injuria," upon which the employer may rely to exonerate itself from liability for an injury resulting from a "defect or insufficiency" due to its own negligence, or as a form of contributory negligence with respect to such defect or insufficiency, is not an available defense under the act.

Assumption of risk, as a defense in its original sense, is restricted by the fourth section, which strikes from the category of "risks of employment" the violation by the carrier of "any statute enacted for the safety of employees." Assumption of risk, as a defense in its secondary sense, is excluded by the first section when the injury results "in whole or in part" from the negligence of the carrier or any of its officers, agents, or employees.

The difference between the common-law and Federal systems of liability may be more clearly presented by a comparative statement of the common-law doctrines and the statutory provisions creating the Federal liability.

At common law the initial defense open to the employer was that the injury was not due to any negligence for which it was responsible; that is, that the injury did not result from the breach of any duty

which it owed to the employee, but resulted from an inherent danger of the business, or wholly from some fault of the employee.

If the injury resulted from a danger inherent in the business, such danger was, by the implied terms of the contract of service, assumed by the employee as a "risk of his employment," and among the risks so assumed was the danger of injury from the negligence of his fellow servant and, according to numerous decisions, the violation by the master of "statutes enacted for the safety of employees."

The act admits in favor of the carrier these two defenses in bar of the action: (1) That the injury was due wholly to some fault of the employee; and (2) that the injury was due to a "risk of his employment," except to the extent that the latter defense is modified by the first and fourth sections of the act. The modifications are: (1) That the defense of fellow service is displaced by the first section, and (2) that the violation "of any statute enacted for the safety of employees," which did not at common law necessarily give rise to civil liability, is made negligence per se by the fourth section.

These are the only defenses in bar of the action, and they are open to the carrier, not because they are common-law defenses, and as such may be set up, but because they are defenses which are necessarily to be implied from the terms of the act. The act excludes all defenses in bar of recovery when the injury results "in whole or in part" from the negligence of the carrier or its officers, agents, or employees.

At common law, although the injury resulted from a "defect or insufficiency" in physical appliances admittedly "due to the negligence" of the employer, there could be no recovery if the employee continued in the service without complaint after becoming chargeable with knowledge of the danger arising from such defect or insufficiency.

This form of "assumption of risk" is not available under the act. The terms in which liability is imposed exclude this defense. The liability is unconditional. Congress did not employ the language "shall be liable in damages, subject to the common-law defense of assumption of risk," and without language, expressly or by implication, adopting this defense it can not be invoked as a bar to recovery.

At common law there could be no recovery for an injury resulting from the negligence of a fellow servant, the risk of injury from that cause being one which the employee was, by the implied terms of his contract, held to have assumed as a "risk of his employment."

Likewise the terms in which liability is imposed exclude this defense. The liability is unconditional. Congress did not employ the language "shall be liable in damages, subject to the common-law defense of fellow service." It is therefore generally conceded that the defense of fellow service is not available under the act. It should be observed, however, that the reason for the exclusion of this defense is, not that Congress was repealing the common law, but that in the exercise of its independent power it saw fit to make the principle "respondent superior" a part of the system of Federal liability as to all classes of "officers, agents, and employees."

At common law, although the injury resulted in part from a "defect or insufficiency" due to the employer's negligence, there could be no recovery unless such defect or insufficiency was the proximate cause of the injury without the intervention of any other efficient cause for which the employer was not responsible.

The terms in which liability is imposed exclude this defense, the first section creating unconditional liability when the injury results "in whole or in part" from the negligence of the carrier or any of its officers, agents, or employees. To entitle the employee to recover it is not necessary that such negligence should be the sole or even the proximate cause; it is sufficient if it is in the line of causation. (Grand Trunk v. Lindsay, supra.)

At common law, although the injury resulted from a "defect or insufficiency" due to the negligence of the employer, or from the negligence of any of its officers, agents, or employees, occupying the relation of vice principal, there could be no recovery if the employee by his own negligence proximately contributed to the injury.

Under the third section "the fact that the employee may have been guilty of contributory negligence shall not bar a recovery, but the damages shall be diminished by the jury in proportion to the amount of negligence attributable to such employee."

At common law also, when the employer's liability might not be otherwise evaded, recovery might still be defeated by proof of a contract, entered into by the employee, exempting the employer from liability. (Griffiths v. The Earl of Dudley, 9 Q. B. Div., 357 (1882).)

This defense is not available under the act, the fifth section expressly providing "that any contract, rule, regulation, or device whatsoever, the purpose or intent of which is to enable any common carrier to exempt itself from any liability created by this act, shall to that extent be void."

The act, when given what seems its proper construction, becomes what its distinguished authorship entitles it to be—a perfect specimen of constructive legislation, while the introduction into its remedial provisions of this incongruous doctrine of the common law renders it altogether unintelligible.

Assumption of risk in its secondary sense as a common-law defense in bar of recovery when the employee was chargeable with knowledge of the employer's negligence nullifies the first section of the act to the extent that that section imposes liability for injury resulting "in part" from "any defect or insufficiency" due to the negligence of the carrier. Congress realized that a variety of other causes might operate more or less directly in the production of an injury, such as the employee's continuance in the service with knowledge of the danger or his contributory negligence with respect to the danger. To avoid escape upon these or other grounds the act imposes unconditional liability for an injury resulting in whole or in part from such defect or insufficiency.

This defense nullifies the first section of the act to the extent that the language "shall be liable * * * for such injury * * * resulting in whole or in part from the negligence of any of the officers, agents, or employees of such carrier" has been regarded as "displacing" the common-law defense of assumption of risk of the negligence of the fellow servant.

If assumption of risk is displaced only in cases involving the violation of "statutes enacted for the safety of employers," why is not the common-law defense of the employee's assumption of the risk of injury from the negligence of his fellow servant still available? The negligence of a fellow servant is not the violation of "any statute enacted for the safety of employees," unless the liability act is itself such a statute. (Philadelphia, B. & W. R. R. Co. v. Tucker, supra.) How, then, is this form of assumption of risk excluded while assumption of risk of the carrier's negligence with respect to its instrumentalities is not excluded? Is it because the defense of the fellow servant is not a part of the defense of assumption of risk?

"An early, if not the earliest, application of the phrase 'assumption of the risk' was the establishment of the exception to the liability of a master for the negligence of a servant when the person injured was a fellow servant of the negligent man." (Schlemmer v. Buffalo, R. & P. Ry. Co., 220 U. S., 590 (1911); Farwell v. Boston & W. R. R. Corp., 4 Met. (Mass.), 49 (1842).)

Courts which hold that assumption of risk is a bar to recovery for injury resulting from a "defect or insufficiency" due to the carrier's negligence concede that assumption of risk can not be invoked to defeat recovery for injury resulting from the negligence of a fellow servant. And why not? The liability for both kinds of negligence is imposed by the same language; both must stand or fall together. But for the unconditional liability imposed by the first section for both forms of negligence there would be stronger reason for holding that assumption of risk might be invoked, under the fourth section, to defeat recovery for the negligence of the fellow servant than for the negligence of the carrier. The risk of injury from the negligence of the fellow servant is a "risk of his employment," which at common law is assumed by the employee (Norfolk & W. R. Co. v. Nuckol, 91 Va., 193; 21 S. E., 342 (1895)), while the risk of injury from the employer's negligence, whatever may be the basis of its assumption at common law, is not a "risk of his employment" assumed by the employee. (3 Labatt on Master and Servant, 1 ed., sec. 894.)

This defense nullifies the third section of the act. It is impossible to reconcile the common-law doctrine that the employee's continuance in the service with knowledge of the risk resulting from a "defect or insufficiency" is a bar to recovery with the peremptory provision of the third section that "in all actions hereafter brought against any such common carrier * * * the fact that the employee may have been guilty of contributory negligence shall not bar a recovery."

The employee's knowledge of the defect or insufficiency, and of the consequent danger, is an element or factor common to both defenses of assumption of risk and contributory negligence. (Norfolk & W. R. Co. v. Cheatwood, 103 Va., 356; 49 S. E., 489 (1905); Buckner v. Richmond & D. R. Co., 72 Miss., 873; 18 So., 449 (1895); 1 Labatt on Master and Servant, 1 ed., secs. 207, 279a, 296.) Can this same knowledge be at once a bar to recovery when considered as an element of "assumption of risk" and not a bar to recovery when considered as an element of "contributory negligence"? Is it conceivable that such an anomalous state of the law was intended by Congress; that Congress intended to preserve against contributory negligence the right of action which it created, only to have that right of action defeated by "knowledge," one of the elements of contributory negligence, called by the name of "assumption of risk," and thus to "palter with us in a double sense"? "Whenever the evidence," says Mr. Labatt, in stating the common-law rule, "suggests that the servant knew of the extraordinary risk which causes the accident, the jury should be instructed regarding the legal consequences of such knowledge as justifying the inference both of an assumption of the risk and of contributory negligence."

The two defenses are so inextricably related that it is impracticable to discover the point at which the employee's "knowledge" as a bar to recovery, when considered as an element of assumption of risk, shall cease to be a bar to recovery when considered as an element of contributory negligence.

In Narramore v. Cleveland, C., C. & St. L. Ry. Co. (supra, p. 304) Judge Taft said:

"Assumption of risk is * * * the acquiescence of the ordinarily prudent man in a known danger, the risk of which he assumes by contract. Contributory negligence * * * is that action or nonaction in disregard of personal safety by one who, treating the known danger as a condition, acts with respect to it without due care of its consequences." In Schlemmer v. Buffalo, R. & P. Ry. Co., 205 U. S., 1, 12, it is said: "Assumption of risk * * * obviously shades into negligence as commonly understood. Negligence consists in conduct which common experience or the specific knowledge of the actor shows to be so likely to produce the result complained of, under the circumstances known to the actor, that he is held answerable for that result, although it was not certain, intended, or foreseen. He is held to assume the risk upon the same ground. * * * Apart from the notion of contract, rather shadowy as applied to this broad form of the latter conception, the practical difference of the two ideas is in the degree of their proximity to the particular harm. The preliminary conduct of getting into the dangerous employment or relation is said to be accompanied by assumption of the risk. The act more immediately leading to a specific accident is called negligent. But the difference between the two is one of degree rather than of kind."

Assumption of risk, then, consists in knowing the danger and acting carefully, while contributory negligence consists in knowing the danger and acting carelessly. Contributory negligence includes, as a part of its elements, every fact constituting assumption of risk. There can not, therefore, be an assumption of risk, as a legal conception distinct from contributory negligence, which does not become merged into contributory negligence when the conduct of the employee goes to the extent of charging him with contributory negligence.

This defense, if indeed its basis is an implied contract, renders nugatory the fifth section of the act, that "any contract, rule, regulation, or device whatsoever, the purpose or intent of which shall be to enable any common carrier to exempt itself from any liability created by this act, shall to that extent be void." (Doherty on Federal Employers' Liability Act, p. 102.)

It is not the purpose of this article to discuss the rationale of common-law assumption of risk of the employer's negligence. If Mr. Labatt states correctly that "the conception underlying the servant's assumption of a known risk is essentially that of an implied agreement," it is not to be reconciled with the fifth section. If Judge Putnam, in Central Vermont Ry. Co. v. Bethune (206 Fed., 868 [1913]), correctly states that "There is nothing of the kind. It is merely a practical rule of common sense, which * * * is in itself independent of the contract of service or any other contract," the academic distinction between assumption of risk and contributory negligence disappears.

Of the "common-sense" theory suggested in the Bethune case, it is sufficient to observe that it is at variance with the legislative intelligence underlying all acts of remedial legislation, including the third and fourth sections of the liability act as construed by the court, so far as concerns dangers resulting from the violation of statutes; and, assuming as it does that the employee voluntarily exposes himself to the danger of pain, maiming, and death, is at variance with every rational human instinct. It is at variance, too, with the opinion of the court in Baltimore & P. R. R. Co. v. Landrigan (191 U. S., 461, 474 [1903]):

"We know of no more universal instinct than that of self-preservation; none that so insistently urges to care against injury. It has its motives to exercise in the fear of pain, maiming, and death. There are

few presumptions based on human feelings or experience that have surer foundation than that expressed in the instruction objected to."

It is evident that the common-law defense, in bar of recovery, based upon the employee's continuance in the service with knowledge of a "defect or insufficiency" due to the negligence of an interstate carrier "in its cars, engines, appliances, machinery, track, roadbed, works, boats, wharves, or other equipment," whether called by the name of "assumption of risk" or "contributory negligence," is not admissible under any express or implied provision of the act, and that the introduction of the defense into the system of Federal liability would render the act nugatory so far as concerns any beneficial result to interstate employees; and worse than that, for the act of Congress supplants all the remedial legislation of the States, and, with this all-pervading doctrine of the common law judicially construed into the act, the last state of the interstate employee would be worse than the first.

EDWARD P. BUFORD.

LAWRENCEVILLE, VA.

An Argument for the Change of Payment of Pensions for Old Soldiers.

EXTENSION OF REMARKS
OF
HON. CYRUS CLINE,
OF INDIANA,

IN THE HOUSE OF REPRESENTATIVES,

Saturday, February 20, 1915,

On the bill (H. R. 21161) making appropriations for the payment of invalid and other pensions of the United States for the fiscal year ending June 30, 1916, and for other purposes.

Mr. CLINE. Mr. Speaker, I had hoped that the House might take some action on House bill 12916, introduced by me for the payment of pensions to old soldiers and soldiers' widows every 30 days instead of every 90 days. These pensions are allowed because of age and length of service.

It is a known fact that the recipients of these pensions in very many instances depend almost wholly upon their pensions for support. A very large proportion of the old soldiers and widows are unable to earn a dollar, and many of them require the assistance and aid of another person to care for them. Under these circumstances, waiting for three months for their payment works an unusual hardship. The advanced cost of living adds to their expenses and requires them to practice the greatest economy to make their pensions pay their expenses. There is no doubt but that the grocer or clothier who carries the pensioner through three months for his pay could and would sell cheaper to him if he received the cash for his sales. Very often the soldier has spent his quarterly pension, before he receives it, for the necessities of life. Ready cash would therefore result in a saving to him in his daily expenses. These pensions ought to be paid every 30 days. No individual running an ordinary business would think of asking his employees, depending upon their wages to live, to wait 90 days for their pay after it was earned. The fact is, the laws of the several States require persons employing labor in commercial or manufacturing enterprises to pay their help as often as every 30 days and frequently every two weeks. The old soldier, too, is the only creditor of the Government who is required to wait 90 days for his pay. Government clerks are paid twice a month. Every officer of the Government in its administrative branches, every Member of Congress, Cabinet officers, judges of the Supreme Court, President of the United States—in fact, every man connected with the service—is paid every 30 days. Why should the old soldiers wait three times as long for their pay as any other person drawing funds from the General Government? The money is appropriated and ready for payment at the beginning of the fiscal year; so there need be no hesitation for lack of necessary funds. It would not be any more expensive for the Government to pay monthly than to pay every 90 days, for the reason that the Government has employed in its Pension Bureau a surplus amount of help that could be easily assigned to doing the extra clerical work necessary. Even if it should cost more than it does now to disburse these funds that under the law belong to the soldier and the soldier's widow, if the disbursement every 30 days will add to their comfort, their convenience, and aid in supplying them promptly with the necessaries of life, payment should not be withheld. It would be difficult to understand, I apprehend, why this payment should be withheld from the old soldier who spent the best years of his life in the Government service, even if the cost of the disbursement was slightly increased. I hope the Congress in its coming session in December will see to it that the Commissioner of Pensions is instructed to make the payment of pensions in the manner and under the terms that I have suggested in my bill.

How the War Trust Is Robbing the Government While Driving Us on Toward the Brink of War.

EXTENSION OF REMARKS
OF
HON. CLYDE H. TAVENNER,
OF ILLINOIS,

IN THE HOUSE OF REPRESENTATIVES,

February 15, 1915.

Mr. TAVENNER. Mr. Speaker, I sat recently in the House of Representatives and heard the Hon. AUGUSTUS GARDNER, of Massachusetts, make the statement upon his responsibility as a Member of the American Congress that—

If war were to break out to-day, it would be found that our coast defenses have not sufficient ammunition for an hour's fight!

Whether or not Mr. GARDNER's statement is correct I can not say, because I do not know; but this I do know, that we do not have the ammunition and armament that we have paid for and should have in return for the countless millions of dollars of the American people's money that have been expended from the Public Treasury.

I mean to say that those Army and Navy officers who do the purchasing of war munitions and who are paid a salary by the people and are trusted by the people to see that the Government receives a dollar's worth of material for every dollar expended have permitted a ring of ammunition manufacturers to outrageously overcharge Uncle Sam for armor, guns, powder, and munitions in general.

For instance, the War Department in 1913 purchased seven thousand 4.7-inch shrapnel from the ammunition ring, paying $25.26 each therefor. At the same time precisely the same shrapnel was being manufactured in the Government-owned Frankford Arsenal for $15.45, all overhead charges included.

Mr. Average Citizen, are you willing that the public officials in the War Department who are spending your money should pay $25.23 for an article that they could have manufactured in Government plants for $15.45?

This instance is not the exception; it is the rule. The Army and Navy officers in 20 years have purchased $175,000,000 worth of armor, armament, and munitions from four firms which have a monopoly in this country on the manufacture of such supplies and have paid this grasping war trust from 20 to 60 per cent more than the same articles could have been manufactured for in Government plants.

WHAT BECOMES OF THE $250,000,000 ANNUALLY?

As the result of frequently repeated statements similar to that made by Mr. GARDNER, the average citizen is at last beginning to ask: "What becomes of the $250,000,000 that is being spent annually on our Army and Navy? Who, pray, is getting the money?"

And it is time the people are beginning to show anxiety, because their money has been squandered like water, and unless Mr. Average Citizen wakes up and removes the wool from his eyes it is going to continue to be squandered.

The reason this matter deserves the immediate attention of the American taxpayers is that the cost of militarism in this country has been growing faster than the average man even dreams. In 1890 the annual cost of our Navy was $20,000,000. To-day it is $140,000,000. There is no use to ask the reader to stop and try to realize how much money $140,000,000 is, because it is an absolute physical impossibility for the human mind to grasp the magnitude of such a staggering sum.

The American people have never been let into the secret of who the profit makers are in the traffic of war and preparation for war in this country, and the methods by which they help themselves at the public trough. I will go further and venture the assertion that not 30 Members of Congress know the identity of the select ring of patriots for profit into whose pockets the millions of the masses are pouring, which gentlemen have a water-tight monopoly in this country on the traffic of war trading, and who have drawn down every penny of $50,000,000 in excessive and extortionate profits from the Government by direct virtue of their influential friends in the Army, the Navy, and in Congress. Lest any gentlemen in high places should resent the implication of being friends of the War Trust, I hasten at the outset to concede their contentions that they are patriots; yes, all of them.

Congress can investigate the war trust until it is black in the face, and it will get nowhere. The Secretary of the Navy can try as he will to get some one to underbid the armor ring,

either in this country or abroad, and he will not be able to escape the net; he has tried and has not been able to escape it. Independent capital is afraid to enter into competition with the armor ring, so deeply rooted is it in the local field, and if the Secretary of the Navy seeks relief from abroad, even in time of peace, he is doomed to disappointment, because the American branch of the international armor-plate ring works in harmony with the European colony, and vice versa, as I shall endeavor to show.

Armor, armament, and ammunition contractors are not big enough fools to cut each other's throats. Their business is to supply for a gigantic profit the wherewithal for the peoples of the earth to enjoy a monopoly of throat cutting and the pulling of limb from limb. As for themselves, they do not indulge in price-cutting warfare. Their game is purely profit making. They start the ball rolling by making nations distrustful of one another, and then in inducing them to overprepare for war. Does anyone doubt that if the European nations had not been so overprepared for war they would have been so willing to have entered into it?

GOVERNMENT MANUFACTURE ALONE WILL PROTECT TAXPAYERS.

Is there no way whatever, it may be asked, by which the people can protect themselves from the greed of the war trust magnates? Yes; just one way. That is by the Government taking the profit out of war and preparation for war by manufacturing all of its own munitions, armor, cannon, and battleships. Both Washington and Lincoln advocated the nationalization of the manufacture of war munitions as sound public policy. Government manufacture as a policy need have no bearing whatever on the question of whether we shall have a large or small Navy. Those who advocate Government manufacture of all war equipment are not so much concerned for the present whether we build one or more battleships a year, so long as the Government does the manufacturing, because, then, for every dollar Congress appropriates for battleships the people will receive a dollar's worth of battleship.

If the Government will manufacture all of its own war materials, millions of dollars will be saved annually to the taxpayers as a result of the already demonstrated ability of Uncle Sam to manufacture at a cost much below the prices of the war trust, as I shall show. Government manufacture will mean that the workmen who perform the labor of actually making the munitions will receive higher wages and better working conditions than the employees of the ring of private contractors receive, as these firms number among them the most bitter enemies of organized labor in the United States, working 51 per cent of their employees 12 hours a day, according to a report of the United States Bureau of Labor made just after an investigation in 1910.

Fortunate indeed would it be for this Nation to-day if the Government had a monopoly of the manufacture of all munitions of war. It is not the average American, the man who will be required to do the fighting and pay the bills if we become embroiled in the European conflict, who is jeopardizing our peace. The average American is remaining at home, attending to his business. It is the ring of war-trafficking private arms and ammunition firms who are endangering the peace and welfare of 100,000,000 people in order that they may satisfy their greed for profit. If we go to war, it will not be on account of anything the average American has done, but because as a Nation we have neglected to safeguard our peace by taking the profit out of war and preparation for war.

WHO THE WAR TRADERS ARE.

Because I believe it is my duty to do so, I desire now to take the responsibility of directing the attention of the American people to the fact that their money appropriated for the Army and Navy is being wasted by the millions, and to take the responsibility of identifying the war traffickers, so that the taxpayers may know where the millions upon millions of their money that has been dumped into the bottomless pit of militarism have being going, are going, and will continue to go unless public opinion shall arise in its might and demand that further waste of public funds shall cease.

To begin with, who and what is the armor ring, if there really is such an animal? Is the term "armor ring" a mere figure of speech, something invisible, or is it possible definitely to place our finger upon it? Answer: It is possible.

The armor ring is the Bethlehem Steel Co., the Midvale Steel Co., and the Carnegie Steel Co. These three firms, exclusive of their subsidiary war-trafficking auxiliaries, have drawn down since 1887 from the Navy Department alone for the single item of armor plate contracts aggregating $95,628,912, divided as follows: Bethlehem, $42,321,237; Carnegie, $32,954,377; Midvale, $20,353,298.

I have just stated that the armor ring is composed of the Bethlehem, Midvale, and Carnegie companies. Remember the names!

Now, the armament ring is composed of Midvale, Bethlehem, and Carnegie. Ammunition ring, Carnegie, Midvale, and Bethlehem. We will add to the ammunition ring, for good measure, the Du Pont Powder Trust, which has no competitors in the sale of smokeless powder to the Government for reasons that will appear most remarkable when explained. The Powder Trust has obtained contracts aggregating about $25,000,000 since 1905. From the Army and Navy combined the other three concerns—Bethlehem, Carnegie, and Midvale—have obtained orders since 1887 exceeding $150,000,000.

There are a few concerns dealing in ammunition of small caliber and others specializing in certain patented articles that obtain contracts, but such contracts are mere crumbs which fall from the lap of the four big war-trading concerns which constitute the War Trust.

SOME DEFINITE INFORMATION AS TO THE WASTING OF PUBLIC FUNDS.

Why has the War Department been paying the ring $17.50 for a 3.8-inch common shrapnel when it can manufacture and is manufacturing the identical article at Frankford for $7.94? Seventeen dollars and fifty cents is more than twice $7.94. The Government could manufacture two shrapnel for the price it has been paying the private manufacturers for one and have $1.62 remaining to the people's credit on each transaction. Is it any wonder we do not have as much ammunition as we should have for the money that has been expended? It is the public funds that are being spent here, and the people have a right to have these questions answered.

We are manufacturing a 31-second combination fuse in the Government arsenal for $2.92 for which we have been paying the ring $7.

These illustrations are not exceptional, as I will endeavor to show by the fact that on a contract given to Frankford Arsenal for ammunition valued at $1,900,064 we are saving $979,840; or, in other words, we are saving approximately $1,000,000 on a $2,000,000 order as compared with what it would have cost had that contract been awarded the ammunition ring. Does not a showing such as this warrant a policy of turning the really big orders over to Government manufacture instead of allowing the war traffickers to charge us practically any price they may agree upon between themselves?

In a recent speech before Congress President Wilson stated that "like good stewards, we should so account for every dollar of our appropriations as to make it perfectly evident what it was spent for and in what way it was spent." Surely no such thought was in the minds of the Army and Navy officials who have been doing the purchasing for those departments.

Realizing the Government was being overcharged for turbine rotary drums, Secretary of the Navy Daniels—who, with one exception, is the only Secretary of the Navy that I can find any trace of who has ever made a real fight to escape the extortions of the armor and ammunition rings—induced an independent English firm to submit a bid. The Bethlehem and Midvale companies bid $169,568 and $160,272, respectively, while the English firm offered to furnish the drums for $57,436, a saving of $102,836 to the Government over the lowest bid of the ring. I am not referring now to armor, because the Secretary has not been able to obtain armor abroad.

Recently the Secretary awarded a contract for building 100 torpedo flasks, including heads. He induced a new firm to slip in with a bid, and was able to purchase for $58,246 materials which under normal conditions would have cost $115,075. The bids of the Bethlehem and Midvale companies, under real competitive bidding, showed a reduction of 44 per cent as compared with bids for similar forgings submitted by these companies only four months previous.

Personally, I believe that these officers who, in the expenditure of the people's money, have been paying $115,075 for supplies which could have been obtained for $58,246, should, somewhere or in some manner, be required to make a public accounting for their acts. The thing that riles the blood concerning the manner in which the millions have been squandered by our Army and Navy officers is that this money did not come from the pockets of the rich, but that it has been wrung from the poorest of the poor. All of these wasted millions have been collected by a tax on the things that the people eat, wear, and use, none of it having been collected by direct taxation, but every cent of it having come through the customhouses and internal-revenue offices, which means that the people have been paying the cost of militarism in the form of increased cost of living.

I am not charging in these remarks the violation of criminal laws, nor yet am I asserting that none have been violated; I

am stating the fact that millions of dollars of the public funds have been ruthlessly wasted, and am endeavoring to show how such waste may be prevented in the future.

SECRETARY DANIELS IS WHOLLY AT THE MERCY OF THE WAR TRUST.

By the most ingenious maneuvering among the war traffickers, Secretary Daniels has been able to save some $2,000,000 from the clutches of the greedy patriots for profit. But, alas, the war trust has at last forced him into a corner, and he is again wholly at its mercy. To elucidate: I am informed that before the outbreak of the European war Secretary Daniels sought, by inquiry, to ascertain from companies in the ring the price of a certain projectile. A price of $490 was made him. The Secretary then invited the representatives of independent foreign companies to visit him and submit prices, at the same time taking extreme care that the domestic bidders should hear of his supposed intentions. The result was the ring reduced its prices from $490 to $325, and the Secretary made his purchases at that figure. Since the European war broke out, Secretary Daniels, I am told, decided to purchase more of the same projectile, but, to his astonishment, was quoted a price of $425. The ammunition-ring bidders, being business men as well as patriots, had taken advantage of the fact that there is no possible chance of the Secretary obtaining anything in the way of war materials from Europe as long as the present war holds out, and boosted their prices accordingly.

HISTORY OF ARMOR IS ONE LONG SCANDAL.

It would require several volumes to cover all the transactions deserving publicity concerning armor. Let it be sufficient in passing to say that the Government purchase of armor has been a scandal from start to finish. The conduct of the armor ring in dealing with the Government averages throughout at least 80 per cent rotten.

There have been nine official estimates as to the actual cost of the manufacture of a ton of armor plate. The average estimate is $247.17 per ton. Yet since 1887 we have purchased 217,379 tons of armor, paying the armor ring an average of $440.04 per ton, or a total of $95,656,240. I believe I am well within the bounds of conservatism when I say that if all this armor had been manufactured in a Government plant at least $35,000,000 would have been saved to the American taxpayers, and armor is only one of the things being purchased by the Army and Navy under similar conditions.

AVERAGE ESTIMATE IS $247.17.

Here is a table showing the official estimated cost of armor by the investigating boards of 1896 and 1906, by various naval experts, by former Secretary of the Navy Herbert, and Rear Admiral Strauss, the present Chief of Ordnance:

Year.	Estimator.	Estimated cost.	
		"Production cost," or cost in a Government plant.	"Full cost," or cost in outside plants, with private profit added.
1896	Lieut. Commander Rodgers	$297.54	$391.86
	Ensign McVay	243.73	337.29
	Rohrer Board	223.43	324.36
	Secretary of Navy Herbert	224.42	324.41
	Average	247.28	344.48
1906	Commander Rohrbacher	193.08	223.16
	Commander Dieffenbach	241.76	277.73
	Lieut. Galbraith	242.33	298.77
	Investigating board of 1906	244.27	295.89
	Average	230.36	273.89
1914	Rear Admiral Joseph Strauss	[1] 314.00	[1] 349.25
	General average	247.17	322.54

[1] Estimate based on cost in plant 10,000 tons yearly capacity. Other estimates based on cost in plant of 6,000 capacity.

Admiral Strauss, Chief of Ordnance, estimates that in a Government plant of 20,000 tons capacity armor can be manufactured at a cost of $279 per ton. This is $31.83 per ton higher than the average estimate of nine estimators, who based their estimates on plants of 10,000 tons capacity.

Here is a table showing the amount the Government would have saved if all armor used up to date could have been manufactured in a Government plant at $279 per ton.

Year.	Company.	Tons.	Average charge.	Total charged.	$279 per ton, reasonable cost to manufacturer.	Overcharge or amount of tribute collected off of taxpayer.
1887	Bethlehem	6,891	$604.85	$4,168,000	$1,819,589	$2,348,411
1890	Carnegie	6,054	671.15	3,475,000	1,688,066	1,786,934
1893	Bethlehem	3,882				
	Carnegie	3,120

[1] New company.

The above total is the tribute levied upon this Government and collected from the American taxpayers during the last 25 years upon the one item of armor plate alone, and which could have been saved to the people by the Government manufacturing its own armor plate.

Take powder. We have purchased $25,000,000 worth of powder from the trust since 1905, paying for it all the way from 53 cents to 80 cents per pound. We are manufacturing powder in Government plants now for 36 cents per pound, and the officers in charge state that the more we manufacture, the cheaper we can produce it. There is little doubt but that from eight to ten million dollars of the twenty-five million dollars paid the Powder Trust could have been saved by Government manufacture.

Secretary Daniels has asked Congress for an appropriation for a Government armor-plate factory, but thus far Congress has refused him.

If the Government builds an armor plate and a padlock is placed on its doors as soon as it is completed, and it is never used, it will, in the opinion of Secretary Daniels, pay for itself simply by enabling him to obtain fair treatment from the armor manufacturers.

TO DEPEND UPON PRIVATE CONTRACTORS FOR MUNITIONS IN TIME OF WAR IS TO PLACE THE GOVERNMENT AT THE MERCY OF PROVEN EXTORTIONISTS.

Army and Navy officers generally are opposed to complete Government manufacture of munitions of war, taking the position that it is the part of wisdom for the Government to encourage private manufacturers to operate plants so that they may be available in time of war. Experience has shown, however, that instead of patriotically coming to the relief of the Government in time of war, the war traders take advantage of the necessities of the Government, which is at their mercy, and boost their prices. For instance, when war with Spain was imminent the armor manufacturers practically issued an ultimatum to the Government that they would not manufacture a single piece of armor plate unless the Government should agree to pay them $100 a ton more than the price fixed by Congress after an investigation as a fair price. And it is also worthy of notice that their patriotism did not prevent them from selling armor to Russia for $249 a ton, while they were asking their own Government $616 a ton.

That the Du Pont Powder Trust practiced similar extortion during the Spanish War would seem to be indicated in the following question and answer on page 82 of the Fortifications bill hearings of 1908:

Question. How was it during the war—did they (the Powder Trust) put up the price tremendously?

Gen. CROZIER. That is a little hard to say. I think we paid $1 a pound, and then the price was reduced to 80 cents.

We are now manufacturing powder in Government plants for 36 cents a pound, every conceivable overhead charge included, and paying the trust 53 cents a pound.

If the Armor and Powder Trusts once overcharge the Government in time of war because they have it at their mercy it is their fault, but if they repeat the performance because they are a second time permitted to have the Government at their mercy, it will be the Government's fault.

ARMOR PLATE PATRIOTISM IS WORLD-WIDE.

There appears to be no real competition between the armor manufacturers of the various countries. Once, in 1893, the American armor ring made a noise like competition, when it sold armor to Russia for $249, while charging the United States $616, and for a time great consternation prevailed in the ranks of the war trusts of the various nations.

But during this period the armor manufacturers of the world met in Paris, and since then there has been little or no competition worthy of the name. The armor manufacturers asked themselves why they should cut each others' throats and why it would not be to their advantage to receive $500 or $600 a ton instead of $200 or $300.

In his report (H. Doc., vol. 58, p. 22, 54th Cong.) Secretary of the Navy under Cleveland, Hon. H. A. Herbert, in commenting on the question of a trust says:

I am informed upon authority which I believe to be good that about, or perhaps before, the time of the last contract of the Bethlehem company with Russia there was a meeting in Paris of the representatives of the principal, if not all, of the armor manufacturers of Europe and America.

This was in 1894; and commenting upon the prices charged in Europe and America, he says, on the same page:

These facts seem to lead to the conclusion that there is at least a friendly understanding or agreement among the principal manufacturers of the world that prices shall be maintained at about the same level.

Here we find evidence 20 years old of a world-wide Armor Plate Trust.

In the naval hearings for 1914, page 621, the present Secretary of the Navy, Josephus Daniels, used the following language in referring to an advertisement for bids for armor plate for the dreadnaught *Pennsylvania:*

When we came to the armor we rejected all the bids, and were then absolutely in a situation from which it appeared there was no relief. Though you can not establish it in black and white, there is no doubt of an Armor Plate Trust all over the world. That is to say, the people abroad who make armor plate will not come here and submit bids, because they know if they do our manufacturers will go abroad and submit bids. They have divided the world, like Gaul, into three parts.

For more definite evidence of the tremendous syndication and wide sympathies of armor-plate patriotism, an examination of the Harvey United Steel Co., of London, is instructive and entertaining.

The Harvey United Steel Co. (see British Stock Exchange Yearbook, 1912, p. 1211)—

was registered July 16, 1901, to amalgamate or control four other companies holding the rights of the Harvey patents for treating steel, including the Harvey Steel Co. of Great Britain (Ltd.), and the Harvey Continental Steel Co. (Ltd.).

They were also licensors for the Krupp and Charpy processes of hardening armor plate.

All of the peace societies in the world have not been able in a century of labor to effect such an international alliance for peace as the Harvey Co., in a few months, succeeded in effecting a world-wide organization for preparation for war. Although paying handsome dividends, it is claimed that this company has been voluntarily wound up during the last year, after the decisions of two extraordinary general meetings held on July 15 and 31, 1912, but it is very difficult to feel sure that this international association of patriots for profit is really dead and that it has not been resurrected in some less discoverable form.

These are the firms which, banded together, were known as the Harvey Steel Co.:

GREAT BRITAIN.

Vickers, (Ltd.). Albert Vickers, chairman of the great English war trafficking firm that bears his name, not only held 2,697 shares in the Harvey Steel Co., but was its managing director, and was one of the two persons intrusted with its alleged winding up.

Wm. Beardmore & Co. (Ltd.) William Beardmore, chairman of this company, was a director of the Harvey Co.

W. G. Armstrong, Whitworth & Co. (Ltd.). J. M. Falkner, a director of this firm, was also on the board of the Harvey Co.

John Brown & Co. (Ltd.), the Coventry Ordnance Co. (Ltd.), and Thos. Firth & Co. (Ltd.) were all represented by C. E. Ellis, with a holding of 7,438 shares.

The Fairfield Shipbuilding Co. (Ltd.), and Messrs. Cammell, Laird & Co. (Ltd.), are, of course, largely interested in the Coventry Ordnance Co. (Ltd.), and are both in alliance with John Brown & Co. (Ltd.), with the last of whom are connected also the Projectile Co. (Ltd.), Messrs. Palmer's Shipbuilding & Iron Co., and the Hadfield Foundry Co. (Ltd.).

UNITED STATES.

The Bethlehem Steel Co. (Ltd.) held 4,301 shares in the Harvey Co. With the Bethlehem Co. was at this time joined Harlan & Hollingsworth, of Wilmington; Union Iron Works, of San Francisco; and Samuel L. Moore & Son, at Elizabeth. Mr. Schwab, the power behind the Bethlehem corporation, had also a $10,000,000 subcontract for armor and gun mountings of two Argentine dreadnaughts building by the Fore River Shipbuilding Co., which he has acquired, and by the New York Shipbuilding Co.

FRANCE.

Schneider & Co. held 9,862 shares in the Harvey Co., while La Cie des Forges et Acieries de la Marine et d'Homécourt held another 150. The Harvey Steel Co. had four French directors, two of whom held 2,000 shares each.

ITALY.

Societa degli Alti Forni Fondiere ed Acciaiene di Terni held 8,000 shares, and was represented by Raffaele Bettini. This firm is in alliance with Vickers (Ltd.) as Vickers-Terni, with a gigantic arsenal, and Vickers are also allied with Messrs. Odero and Messrs. Orlando.

Messrs. Armstrong, Whitworth & Co. hold the shares of Armstrong-Pozzuoli (Ltd.), whose arsenal is "the chief supply of war material to the Italian navy," and Ansaldo-Armstrong & Co. (Ltd.), of Genoa, is in the same group.

GERMANY.

Actien Gesellschaft der Dillinger Huttinwirke. In alliance with the patriot firms of England and France this company held no fewer than 2,731 shares, and was represented on the board by Fritz Saeftel, of Dillingen, Saad, Germany.

Friedrich Krupp, of the famous Krupp factories, held 4,731 shares, and was represented by Heinrish Vielhaber and Emil Ehrensberger.

Krupps are related to the Skoda Co., of Austria; Schneider & Co., who make the Creusot gun, have interests in Russia; while the Dillinger firm is owned by Deutsche Waffen & Munitions Fabrik, which has holdings in Belgium and in the Mauser Co., in addition to its huge munition factory in Germany.

METHODS OF THE WAR TRAFFICKERS IN KEEPING UP BUSINESS.

There are tricks in all trades. If the peoples of the several powers can be incited to mutual distrust, suspicion, and hatred, for instance, it means increased dividends for the stockholders of the war traffickers in each country.

The several leading powers aim to increase their naval strength in the same proportion. If one of the powers can be induced to take on an additional superdreadnaught, it is used as an argument as to why the other leading powers should do the same. It works as an endless chain, with the war burden ever and ever increasing on the backs of the taxpayers of the world.

If a new design can be worked out, that, too, means more grist for the shipbuilders. It calls for the speedy "scrapping" of the vessels already on hand as "obsolete," "scrapping" meaning throwing on the scrap heap as old junk. So the life of the battleship is ever lessening.

Another trick in the trade of the war traders which is obviously profitable, otherwise it would not be continued, is the hiring of retired Army and Navy officials and ex-Members of Congress by the powder, armor, and shipbuilding concerns. These ex-officials know the inner workings of the military branches of the Government, know the personnel in an intimate way, and by private conversation, by correspondence, and in various ways are in a position to obtain much useful information. They know how to go about things for results. Through these ex-officials the War Trust has become thoroughly at home in Washington.

There seems to be no limit to the extremes to which the war traders are willing to go for business.

Although scarcely believable, it is the proven fact that British and German war trusts many years ago actually set about to represent to their respective home Governments that their rivals were planning to build and building great armadas of giant fighting craft, which have since been proven absolutely to have been figments of the imagination pure and simple. The same character of campaigns has been going on between France and Germany, between the countries in the triple alliance and the triple entente, and it is yet to be established whether the United States of America has not also been the victim of a similar brand of commercialism, in which patriotism is the means and profit the end.

Misrepresentation as to the building programs of Great Britain and Germany were carried on to such an extent that the papers became full of it, and the suspicion of the people toward each other grew and grew. It was inevitable that there could be but one end to such proceedings, and that end war.

Specific information, replete with details, is available to show just how the work was carried on.

Briefly, this is the story: Beginning in 1906, Mr. H. H. Mulliner, managing director of the Coventry Ordnance Co., of England, one of the great British war trafficking concerns, gave himself to the work of propagating the myth of a gigantic expansion of Krupp's works in particular and German military acceleration in general. The "Diary of the great surrender," which Mr. Mulliner himself afterwards published (London Times, Jan. 3, 1910), contains these two entries, which practically covered the period of the campaign:

May 13, 1906, Mr. Mulliner first informs British Admiralty of preparations for enormously increasing the German Navy. (This information was concealed from the British nation until March, 1909.)

March 3, 1909, Mr. Mulliner giving evidence before the British Cabinet, proves that the enormous acceleration in Germany for producing armaments, about which he had perpetually warned the Admiralty, was an accomplished fact, and that large quantities of naval guns and mountings were being made with great rapidity in that country.

It was an underground campaign, but subsequent letters and speeches (Mulliner's communications to London Times, Aug. 2 and 16, Sept. 21, Dec. 14 and 17, 1909; Jan. 1, 3, 6, 7, 8, 12, 15, and 18, 1910, etc.) indicate that Mr. Mulliner's "information," sent first to the war office in May, 1906, was "passed on to the Admiralty," "was discussed by them with several outsiders," and then "passed from hand to hand so that hundreds have read it."

Of this "information" it need only be added that as soon as it became public it was contradicted by Messrs. Krupp, through Hon. John Leyland, member of Parliament, in England, and other correspondents. After some years it was practically admitted by the British Government to have been false. Time has proved that it never had any real basis.

But the "information" had its effect, the effect that Managing Director Mulliner, of the Coventry Ordnance Co., desired that it should have. The "information," becoming public, swept Great Britain off its feet. The people took up and repeated the war traders' slogan: "We want eight, and we won't wait," meaning battleships.

Ten days after Mr. Mulliner presented his "information" to the supreme governing body of the British Empire the statement explanatory of the navy estimates was made. It showed a total of $170,793,522 for 1909–10, an increase of $13,720,752; new construction accounting for an increase of $6,512,400.

As a result of the "tip" furnished by the managing director of the war munition firm, the British Government foretold that Germany would have 17 dreadnaught battleships by March, 1912, and Leader Balfour, still more impressed by the fake "scare," declared Germany would have 25, or, in any case, 21 dreadnaughts in March, 1912.

On almost the same day the predicting was going on in England, the German admiral, Von Tirpitz, told the budget committee of the German Reichstag that the Germany Navy would have only 13 dreadnaughts in the autumn of 1912.

Germany had, in fact, according to the British Naval Annual, only 9 dreadnaught battleships and cruisers on March 31, 1912, and only 14 on March 31, 1913.

GERMANY AND FRANCE EXPLOITED BY ARMAMENT FIRMS.

Germany, too, has had its scandal on account of the war-trust octopus. In his speech in the Reichstag on April 18, 1913, Herr Liebknecht made exposures and revelations which created a profound sensation throughout the world. Presently I shall quote liberally from this great speech, but in passing will call attention briefly to the remarkable conditions of affairs revealed by him:

The German Arms and Ammunition Factory, one of the greatest ordnance establishments in the world, employing an agent—Brandt by name—whose special duty it was to corrupt and keep in his pay officials of the military departments of the German Government.

Government documents of the most confidential nature finding their way by mysterious channels into the safes of Herr von Dewitz, one of the managers of Krupp Works.

A great illustrated journal of Leipzig preparing, with the open cooperation of the Government and the armament firms, a special number designed to smooth the passage of the military and naval appropriations.

Herr von Gontard, director of the German Arms and Ammunition Factory, inspiring in the Pan-German organ—Die Post—the most violent diatribes against France; giving orders to have a French newspaper publish articles representing that the French war department was increasing its number of machine guns when it was doing nothing of the kind; first exciting French opinion by provocative matter in the German press, and then instigating a German demand for armaments by means of bellicose utterances in the French press.

Dr. Liebknecht was supported by Herr Pfeiffer, a deputy of the Catholic Center Party, a man of high standing in the Reichstag. Authentic documents were produced, and the war minister himself, Gen. von Herringen, was forced to take cognizance of the disclosures.

The German Arms and Ammunition Factory, known in Germany as the Waffenfabrik, is a group of firms rather than a single concern; a great trust uniting under common direction the principal concerns engaged in the production of such necessaries of war as cannon, rifles, machine guns, shell, cartridges, etc., and second in importance only to the great Krupp plant itself. Besides its great works at Dollingen, in Germany, the Waffenfabrik control the Mauser factories (famous for the rifles bearing this name) and the National Arms Factory of Heristal, in Belgium.

Here is a letter published in Vorwarts, a German newspaper, which affords an inside glance of the business methods of a war-trafficking firm:

PERSONAL DOCUMENTS.

(Sheet 15.)

Mr. ——— ———, *Paris:*

(G. No. 8236. Geheim-registratur, i. e., number in register of secret documents.)

We have just wired you: "Please await in Paris our letter sent today."

The reason for this message was that we should be glad for you to get an article into one of the most widely-read French newspapers—the Figaro, if possible—to the following effect:

"The French ministry of war has decided to accelerate considerably the provision of new-pattern machine guns and to order double the quantity at first intended."

Please do your utmost to secure the acceptance of an article on these lines.

Yours, faithfully, VON GONTARD, *Poscgarten,*
(For the German Arms and Ammunition Factory).

To explain this missive—if, indeed, any explanation is necessary—it may be suggested that the Waffenfabrik, a German ammunition firm, desiring to obtain an order for machine guns, which the Reichstag did not seem disposed to agree to, sought to obtain the insertion of a news item in the Figaro, one of the great dailies of Paris, to the effect that France was doubling the quantity of its machine guns. It can readily be conceived how such a clipping from a leading Paris newspaper would be an effective exhibit to accompany a request to the Reichstag for an order for more machine guns for Germany. Such is armor-plate patriotism.

JAPAN HAS RECENTLY HAD BIG NAVAL SCANDALS.

The war trust does not confine its operations to the Christian nations, but gathers the pagan governments into its net as well. The arm of the war trust is long. It has reached across the Pacific and laid hold of Japan. In the last year and a half Japan has had army and naval scandals that have shaken it to the core. There have been arrests, courts-martial, convictions, imprisonments, and attempted suicides of high military officers, all due to the fact that profit has not been taken out of war and preparation for war.

Vice Admiral Koichi Fujii, formerly Japanese naval attaché at Berlin, was ordered before a court-martial, convicted, and sentenced to four years and six months imprisonment, charged with having received illicit commissions for influencing the allotment of admiralty contracts in favor of a German war-trafficking firm. Capt. Sawasaki was sentenced to one year for the same offense.

Vice Admiral Tsurutaro Matsuo, inspector general of naval construction, was sentenced to two years in the penitentiary.

Vice Admiral Matsumoto was sentenced to three years in prison.

Giichi Iida, managing director of the Mitsui Co., and Jotaro Yamamoto, of the same firm, were sentenced to 18 months, the sentence of Iida being later suspended.

Baron Masuji Yamanouchi, vice admiral of the reserve and member of the Japanese House of Peers, whose name was mentioned in naval scandals, attempted hara-kiri.

Kenzo Iwahara, former New York manager of the Mitsui Co., was sentenced to 2 years.

Several Japanese contractors were arrested in connection with the military scandals, and foreigners in Japan who were involved in them were convicted and imprisoned, as follows: Andrew M. Pooley, an English journalist, 2 years; V. Hermann, Tokyo representative of a German armament firm, 1 year; George Blundell, an English journalist, 10 months.

POWDER TRUST NO BETTER THAN ARMOR TRUST.

The history of the transactions between the United States Government and the Du Pont Powder Trust average with the history of the dealings between the Government and the armor makers. The aggregate of the sums paid the Du Pont trust in excessive and extortionate profits no doubt runs into the tens of millions.

In the period between 1905 and 1913 alone the Government purchased 29,565,512 pounds of powder from this trust, paying on an average of 80 cents a pound for 3,297,712 pounds of .30-caliber powder and an average of 65 cents a pound for 29,565,512 pounds of Army and Navy smokeless powder, or a total of $21,998,250.

The Government is now manufacturing powder for 36 cents a pound, all overhead charges included, and the larger the quantities it manufactures the lower the cost. If the Government had manufactured all of the powder it purchased between 1905 and 1913, it would have cost $11,830,754 instead of $21,998,250, or have resulted in a saving of $10,167,496, enough to build a first-class battleship.

What the Government would have saved had it manufactured all the powder it purchased from the Du Pont Powder Trust between 1905 and 1913:

Year.	30-caliber powder.		Army and Navy smokeless powder.		Total paid Du Pont Trust.	Cost in Government plant, at 36 cents per pound.
	Quantity purchased.	Net average price paid trust.	Quantity purchased.	Net average price paid trust.		
	Pounds.		*Pounds.*			
1905	165,621	$0.8422	4,610,052	$0.7063	$3,395,872.62	$1,719,242.28
1906	197,795	.8415	4,831,961	.6990	3,544,147.57	1,810,712.16
1907	235,020	.8419	2,516,280	.6857	1,923,283.71	990,468.00
1908	796,144	.8428	2,874,061	.6738	2,607,670.11	1,321,273.80
1909	570,129	.8268	2,889,691	.6623	2,385,315.88	1,245,535.20
1910	569,565	.7759	2,433,203	.6227	1,957,115.74	1,080,996.48
1911	568,208	.7509	5,028,210	.5996	3,411,373.78	2,000,310.48
1912 (11 months)	235,230	.7489	4,382,054	.5927	2,773,471.36	1,662,216.24
Grand total	3,297,712	.8069	29,565,512	.6541	21,998,250.77	11,830,754.64
Total paid Du Pont Trust in 8 years						21,998,250.77
What cost would have been in Government plant						11,830,754.64
Saving that would have resulted to taxpayers by Government manufacture						10,167,496.13

The Du Ponts boast they have been selling the Government its powder since the Civil War. If a saving of $10,167,496 could have been effected by complete Government manufacture in eight years, how much do you imagine could have been saved by Government manufacture in the half century between the Civil War and the present day?

The Du Pont Trust has no competition in the sale of smokeless powder to the Government. Strange to say, this is as much due to the Army and Navy officers as to the trust itself.

When Admiral Twining, for the Navy, and Gen. Crozier, for the Army, appeared before the Appropriations Committee, in 1912, they practically stated that it was the policy of the Government to discourage any concern from trying to enter the powder field in competition with the trust.

Admiral Twining was asked the direct question as to whether he considered it advisable for the Government to buy all of its powder from one company:

Admiral TWINING. I think it is distinctly to the advantage of the Government to have all the powder that is made by commercial concerns made by one company or under one management. I do not mean by that I think that company should be the Du Pont company; but since that is the company in the business, I believe it is better for the Government to continue to get the powder from them rather than encourage others to come in the business.

To fully appreciate this attitude on the part of Admiral Twining the fact should be considered that Admiral Twining and other Army and Navy officers oppose complete Government manufacture of munitions of war on the ground that if there is competition between manufacturers each concern will try to develop a product superior to its rival's in order to obtain the Government business, and that the Government will profit by this rivalry. The statement of Admiral Twining is therefore directly opposite the attitude taken by himself and Gen. Crozier in seeking to justify the present policy of giving the bulk of Army and Navy contracts to a ring of private contractors at excessive prices.

Contrast the statement of Admiral Twining above quoted with the following philosophy which he uttered at the same hearing scarcely 10 minutes previous:

I think it is a fact, inherent in human nature itself, that a monopoly, whether private or public, does not lead to good results.

Gen. Crozier, Chief of Ordnance of the Army, who does the buying of powder for the Government, is also on record as favoring the Du Pont Trust.

When the Supreme Court entered its decree ordering the dissolution of the Du Pont Trust, Pierre S. Du Pont, acting president, wrote the Secretary of War, imploring him to use the influence of the War Department with the Attorney General's Office to prevent the separation of those units of the trust manufacturing powder for the Government; or, in other words, to arrange it so that the Du Ponts would continue to have a monopoly on the sale of smokeless powder to the Government!

The plan as now proposed—

wrote acting president Du Pont in this most remarkable letter, which was dated November 15, 1911—

contemplates a complete dissolution of our military smokeless powder department and its reorganization into two or more separate and distinct corporate units, each to be operated independent of the other and in competition with each other, with all that this implies.

* * * * * * * *

We * * * believe that if the Attorney General could be informed through your department or otherwise of the real facts surrounding the smokeless powder industry and its relations to the United States Government he might feel inclined to permit the situation to remain as at present.

To *permit the situation to remain as at present* was to leave the Government absolutely at the mercy of the Powder Trust. What a sublime confidence the head of the Du Pont Trust must have had in the Secretary of War to make such a request, and that in writing!

The Secretary of War referred this letter to Gen. Crozier, who made certain indorsements upon it and returned it to the Secretary.

Under existing conditions—

Reported Gen. Crozier in part—

I consider that the department is doing very well. The Du Pont Co. has a considerable reserve capacity available for war's needs, while a new company could not be expected to bring into existence and maintain, with expense, plant in excess of that employed in time of peace. * * * Established confidence is worth something. The department does not find itself pressed by any necessity for a change in the present situation.

The end of the matter was that the Supreme Court left the "military plants" of the Du Pont Co. in one group. So far as the Government is concerned, the Du Pont Trust remains a trust.

The attitude of Gen. Crozier was a service worth large sums to the Powder Trust, and the Du Ponts are realizing on it to this day, because the trust is still without competition in the sale of smokeless powder to the Government.

POSITIVE EVIDENCE OF INTERNATIONAL COMBINE.

The powder makers of the world, like the armor makers, have been in an international combine for years. Here are two paragraphs in the world agreement entered into in 1897, which agreement was used by the Government in its suit against the Du Pont trust:

Whenever the American factories receive an inquiry for any Government other than their own, either directly or indirectly, they are to communicate with the European factories through the chairman appointed, as hereinafter set forth, and by that means to ascertain the price at which the European factories are quoting or have fixed, and they shall be bound not to quote or sell at any lower figure than the price at which the European factories are quoting or have fixed. Should the European factories receive an inquiry from the Government of the United States of North America or decide to quote for delivery for that Government, either directly or indirectly, they shall first in like manner ascertain the price quoted or fixed by the American factories and shall be bound not to quote or sell below that figure.

* * * * * * *

The American factories are to abstain from manufacturing, selling, or quoting, directly or indirectly, in or for consumption in any of the European territory, and the Europeans are to abstain in like manner from manufacturing, selling, or quoting, directly or indirectly, in or for consumption in any of the countries of the American territory. With regard to the syndicated territory, neither party is to erect works there, except by a mutual understanding, and the trade there is to be carried on for joint account in the manner hereinafter defined.

Nor is this the worst: The Du Ponts and the Government have always been in the habit of exchanging all secrets in the manufacture of powder. Government chemists and Government officers are continually experimenting to improve the quality of powder, and whenever they make a discovery of any character full information is furnished the Du Ponts.

And the Du Ponts have been in an agreement with a German firm—the United Rheinisch Westphalian Gunpowder Mills—to keep it informed of all improvements in the processes of powder making.

Here is the actual wording of the contract:

Tenth. That any and every improvement upon said processes of either of them made by either of the parties hereto at any time hereafter shall forthwith be imparted to the other of the parties hereto.

And even this is not all. The Du Ponts agreed to keep the German concern informed at all times of all powder furnished to the United States Government, stating in detail its quality and characteristics, and even the quantity, making themselves, to all practical ends, paid informers of a foreign Government.

Here is the exact language:

Thirteenth. That the parties of the second part (the Du Ponts) will, as soon as possible, inform the party of the first part (the German concern) of each and every contract for brown powder or nitrate of ammonia powder received by the parties of the second part from the Government of the United States, or any other contracting party or parties, stating in detail quantity, price, time of delivery, and all of the requirements that the powder called for in such contract has to fulfill.

As the German Government maintains a strict supervision over German military manufacturing concerns, there can be little doubt but that the German Government knows of every pound of powder we purchased during the life of this agreement, its exact quality, and exactly the extent of our reserve supply.

I quote the following from an article by Charles Johnson Post in Harper's Weekly for May 9, 1914:

Do you recall the friction with Germany in 1898 over the German naval squadron in Manila Bay? A German admiral brought on a situation that might have held momentous consequences. And Germany knew to a pound what our powder reserves were and what their qualities were.

The names attached to the German contract were Eugene Du Pont, Francis G. Du Pont, H. A. Du Pont, William Du Pont, trading as the E. I. Du Pont de Nemours Co.

At the time Gen. Crozier reported to the Secretary of War that "the department does not find itself pressed by any necessity for a change in the present situation," the Du Ponts were charging the Government 75 cents a pound for .30 caliber powder and 59 cents a pound for Army and Navy smokeless powder, the Government purchasing from the trust in that year alone $3,411,373 worth of powder, of which sum $1,411,063 could have been saved to the taxpayers had this powder been manufactured in Government plants at a cost of 36 cents a pound; and there is every reason to believe that such large quantities could have been manufactured in Government plants at a cost less than 36 cents a pound.

FORMER EMPLOYEE OF DU PONTS ESTIMATED THEIR COST AT 21 CENTS A POUND.

What it actually costs the Du Pont Trust to manufacture a pound of powder is a secret which the Du Ponts refuse to divulge, as they have a perfect right to do, although the Government permits the Du Ponts to know the cost of every step in the process of powder making in Government plants and gives them the benefit of all economies discovered by it from time to time in the making of powder.

Mr. Robert S. Waddell, of the United Safety Powder Co., of Louisville, Ky., who was with the Du Pont Co. as general sales agent for the United States for 21 years, and who has built several powder mills, estimated, in the hearings on the fortifications appropriation bill in 1912, page 187, that the cost to the Du Pont concern in making ordnance smokeless powder is $0.218, exclusive of selling costs, which estimate aroused Admiral Twining, Gen. Crozier, and Vice President Buckner, of the Du Pont trust, to a high state of fury.

Testifying at the hearing on the fortifications bill, February 18, 1908, Gen. Crozier, discussing the question of a fair price to be paid the Powder Trust for powder, scoffed at the idea that powder could be manufactured for 33 cents a pound, as had been charged, as he said—

by some people who objected to what they called a private monopoly. A board of which Maj. Hoffer was a member—

Stated Gen. Crozier—

finally concluded that 67 cents would be a proper price to pay private manufacturers, and they have accepted that (p. 82, hearings on fortifications bill, 1908).

Contrast this "proper price" of 67 cents with the fact that the Du Pont Trust is now glad to receive 53 cents and that the Government is itself manufacturing powder for 36 cents. At the hearings on the fortifications bill in 1912 Gen. Crozier gave so many estimates as to the cost of manufacture in Government plants and in the Du Pont plants that it is exceedingly difficult to follow him. One estimate, based on the assumption that the Du Pont Trust was manufacturing powder under the same conditions as the Government, was that it would cost them 52 cents a pound as the minimum, exclusive of profit; and on the following day he estimated that it would be 50 cents without profit, and, allowing 15 per cent profit, it would be 57½ cents a pound.

Page 282 of the 1912 hearings contains a table supplied by Gen. Crozier, in which he fixes the cost of powder in the Army powder plant at 40 cents and in the Du Pont plant at 50 cents, exclusive of profit.

This table is valuable to the Powder Trust, because it would indicate that it costs the trust 50 cents a pound to manufacture powder without any profit included. The trust is now accepting 53 cents a pound for powder. But when an effort is again made to bring about a reduction in price, the representatives of the trust will be in a position to say:

How can the Government ask for any reduction, when Gen. Crozier, who is in charge of the Army powder factory, and in a position to know, has estimated that it actually costs us, net, 50 cents a pound to manufacture our product?

The answer, of course, would be that the board of which Maj. Hoffer was a member estimated that 67 cents would be a proper price to pay the trust, and the board was mistaken, and that its error was on the side of the trust and against the interests of the American taxpayers, who pay the powder bills, and that the same possibly may be true of Gen. Crozier's estimate.

POWDER TRUST PAID 18 PER CENT DIVIDEND ON $35,000,000 OF WATERED CAPITAL.

Touching the question as to whether the Du Ponts have been able to make a profit, Mr. Waddell, while on the witness stand, declared:

I know by the sworn testimony of the Du Ponts that they have been paying 18 per cent dividends on $35,000,000 of watered capital, and have created a surplus fund in addition to that of $16,000,000, so that they are not losing any money on the investment of their capital.

The printed hearings on the 1912 fortifications bill constitute a remarkable document. They include a complete exposé of the Du Pont Powder Trust and the attempted explanations by the agents of the powder company. However, it is almost impossible to obtain a copy of this document now, as the supply is exhausted. I will therefore quote a few extracts from the copy of the hearings which I have.

Mr. Waddell was testifying that although there was large profit in the powder business, it was impossible to get investors to build a plant to compete with the Du Ponts in Government business, because, he declared, the Du Pont Co. maintained a lobby and enjoyed such close connections with Government officials that it would be impossible to successfully compete with them.

Mr. WADDELL. The Du Pont Trust is so strongly intrenched, and their methods are so binding on the Government and everyone associated with it, from tradition, from personal influence, from misrepresentation, and all other causes that they use through their publicity bureau in their promotion of their business, that it would be impossible to dislodge that organization from the business that they hold. It would cost too much money to do it.

* * * * * * *

Mr. WADDELL. I should say that my statement in regard to the potency of the Du Pont lobby in Washington is the fact that they maintained here a Mr. Buckner, who was the president of the International Smokeless Powder Co. and a vice president of the Du Pont Trust. He devotes his entire time and attention to Washington business; makes this his headquarters. He does not do anything else. When I was with the company they paid their vice presidents $30,000 a year, and I presume he is getting a good, rich salary and a liberal account for expenditures. I know there is a very great deal of money spent here for entertainment—not offensively; I would not use it in that sense, but in the sense that a sales department always does; they entertain their customers and treat them as well as they know how. They are as courteous as they can be and spend a great deal of money in that way, and we would have to meet that kind of competition.

Question. Translating your statement, is it your judgment that it is necessary for a company to maintain what you have designated on the part of the Du Pont people as a lobby, with considerable expense, in order to obtain from the Government equal consideration of any proposals you might be prepared to make touching the furnishing of powder?

Mr. WADDELL. I think my judgment of lobbies here is that they are an offense rather than a benefit to the Government.

Question. You say "they." Whom do you mean by "they"?

Mr. WADDELL. The Du Pont Trust have a publicity bureau they maintain which is for the purpose of influencing not only the purchasers of powder and the people who place their orders, but even the Department of Justice and the United States courts.

* * * * * * *

Mr. WADDELL. The Du Pont Trust, so far as I know, have never been accused of unwarranted generosity and throwing away money, and the fact that they spend hundreds of thousands of dollars in Washington is one that they can explain the reason for better than I can.

Question. What evidence have you for that statement—the fact that they spend hundreds of thousands of dollars in Washington?

Mr. WADDELL. The general information that comes to me through conversations with Washington people.

Question. Will you indicate the character of that information and the conversations that warrant that statement?

Mr. WADDELL. The fact of their testimony and the continuous presence here of Mr. Buckner and their publicity agents and many others. I have witnesses to the expenditure of some of the money and to the fact that they kept for some time on the Potomac River a private yacht of T. C. Du Pont, the president of the Powder Trust. That yacht is called the *Tech*, which the skipper told me was for general entertainment purposes, and that the larder of it was magnificently supplied with everything that could contribute to that end. This yacht made excursions between Washington and Indianhead, and the general information of the country in regard to the actions of the Powder Trust in Washington was sufficient for anyone to have information in regard to them.

* * * * * * *

Mr. WADDELL. The main reason why an outside company can not compete for the trade of the Army and Navy is the prestige of the Du Pont Co. that has built up here through a system which has been installed here in Washington and is being worked to the limit.

Question. Let us understand what you mean by that. How do you consider that what you designate as the prestige of the Du Pont people would militate directly against a competitor seeking a contract with the Government?

Mr. WADDELL. The officers of the Army and Navy, and particularly of the Army, come into intimate contact with Senator HENRY A. DU PONT, of Delaware, who is chairman of the Committee on Military Affairs of the Senate. [Senator DU PONT is not now chairman, but a member of the Military Affairs Committee.] That position gives him a strong influence compared with that of an outside manufacturer, and in stating this I do not want to reflect on any officer, but at the same time the influence of a man high in authority in the Senate and at the head of West Point does have a very potent power over the members of the Army, and it would be foolish for me to ignore that fact.

* * * * * * *

Question. You stated awhile ago that you thought there were two plans open to the Government—one the entire manufacture of this powder and the other the purchase of it under regulations as to price. Which do you consider more advisable, and why?

Mr. WADDELL. I would very strongly recommend the building of Government plants and making their own powder, for the reason that you keep within your own councils in the Army and Navy the information that should be retained there, and not have it go out to clerks and other people. It would stimulate the Army and Navy to be leaders in that department rather than let them, as they do now, share the responsibilities. A divided responsibility is not a good thing, in my estimation, from a business standpoint, for efficiency. Another reason is that the people of this Nation are bitterly opposed to the fostering and upbuilding of great monopolies, and we have recently had a judicial monopoly created out of the Du Pont Trust, through the courtesy of Mr. Wickersham, Attorney General, which ratifies the world agreement and gives the exclusive sale of all foreign smokeless powder in the United States into the hands of the Du Pont Co. It avoids the tariff laws to the extreme; it is an influence that should not be fostered by Congress or by any other party, and I believe that it would stimulate and raise the public opinion of the Navy, which is admired by all the people, if we felt confident that the manufacture and control of the powder question was in their hands alone.

* * * * * * *

Question. I notice you refer to the fact that $35,000,000 of common stock, upon which a dividend of 18 per cent was declared, was watered stock, so called. What is the basis for that statement?

Mr. WADDELL. The capital stock of the Du Pont Trust, which is organized under the laws of New Jersey, is $25,000,000 preferred, and, at first, $25,000,000 of common, and later increased to $35,000,000 of common, making the total capital stock $60,000,000. The preferred stock represented their property, their holdings, and their assets of all descriptions, and was put on the market at $70 a share. Taking their own estimate of their own wealth at that time the complete assets, 70 per cent of $25,000,000 would be $17,500,000, which would be the actual value of the assets, and the common stock was water, all of it.

Question. Do you know to whom the common stock was issued at the time of the organization or subsequently?

Mr. WADDELL. At the death of Eugene Du Pont in January, 1902, the president of the company, the old company, three men, T. C. Du Pont, Pierre Du Pont, and Alfred Du Pont, formed what was known as the "Delaware 1902 Corporation," with a capital of $20,000,000, and they issued $12,000,000 of stock. The cash paid in by the three was $3,000, or $1,000 apiece. The three men—I called them the triumvirate—took 75 per cent of the stock, $9,000,000 of the stock, for promotion fees, giving $3,000,000 of the stock to the 1899 Delaware corporation, the old company, and they also gave the notes of this company for $12,000,000, unsecured. Later they formed the big holding company, the E. I. Du Pont de Nemours Powder Co., of New Jersey, with a capital of $50,000,000, $25,000,000 of common and $25,000,000 of preferred. These three fellows, the triumvirate, for their Delaware corporation, of which they owned 75 per cent, took about 64 per cent of the combined common and preferred stock, the control of it, for promotion fees, and they made the New Jersey corporation pass a resolution guaranteeing payment of the $12,000,000 that they had given the Delaware corporation for the purchase of their stock, and they did it. The total investment of the three men in the Du Pont Trust was $3,000 in cash; that is all the money they ever put in it, and that is the testimony of Pierre Du Pont, treasurer of the trust.

Question. In the Government's case?

Mr. WADDELL. Yes. You can get it in the brief of the facts, if you desire it.

FORMER DU PONT EMPLOYEE SAYS GOVERNMENT SHOULD MANUFACTURE ITS OWN POWDER.

It will be noted that Mr. Waddell, who has been in the powder business for a quarter of a century, advocates the Government manufacture of this military commodity. It may be of interest to my constituents to know that Mr. Waddell has a son living in our congressional district, Mr. Robert S. Waddell, cashier of the Maple City Manufacturing Co., of Monmouth, Ill.

Mr. WADDELL. I believe that the time has come when the Government should make its own powder in its own works. It does not cost anything to let a plant lie idle. You can paint the machinery and the wooden tanks do not get hurt much if you keep them full of water. There is very little about a smokeless-powder plant that would deteriorate from standing idle, and you had better have large facilities. I know this, that at the outbreak of the Spanish-American War the du Pont people worked the machine shops of Wilmington, Philadelphia, and other cities to the limit day and night and Sundays to make machinery with which to manufacture powder. Dewey went into his fight at Manila short of powder—very short of it. I went about the country lecturing before clubs and other organizations explaining why we were short of powder and what the trouble was. The conditions were bad. You should have facilities for making your own powder and an abundance of facilities. There ought to be a great big Government plant on the Pacific coast in California, Oregon, or Washington. As I say, there ought to be a Government plant on the Pacific coast in the Puget Sound district. There ought to be another in the Mississippi Valley district or the Middle West, and then there should be another on the east coast. With these facilities you would have plants extending from coast to coast, and the total investment would be very small.

HIGH EX-ARMY OFFICER AND EX-MEMBER OF CONGRESS REPRESENT POWDER TRUST IN WASHINGTON.

Col. Buckner, vice president of the Du Pont Trust and its Washington lobbyist, is now testifying. Note carefully what he says. After stating positively that the Powder Trust has no lobby in Washington he recites that, in addition to himself, it is represented in Washington by a high ex-Army officer and an ex-Member of Congress:

Col. BUCKNER (vice president of the Du Pont Trust). His statements on that subject are all false. There has never at any time in the history of the Du Pont company existed a lobby. I am the only representative of the Du Pont Powder Co., except that I have employed in my service Gen. Humphrey, who looks after small details. I have to have a representative here in this city, and when he retired I employed him to look after such little details as getting information from all of the departments that affect the Du Pont Powder Co.

* * * * * * *

Q. You spoke of Gen. Humphrey, a retired Army officer, now being a representative of the company. What other persons at any time has the company had employed in connection with contracts with the Government?

Col. BUCKNER. No one, except since I have been out of the country so much I have turned the business over to Mr. Landis to look after this business down here in a measure, but not entirely, because I have been away from the country.

IOWA CONGRESSMAN EXPRESSES DISAPPROVAL OF THE METHODS OF THE POWDER TRUST.

A Member of Congress who deserves great credit for his efforts to protect the Government from the extortionate prices

charged Uncle Sam by the Powder Trust is Representative JAMES W. GOOD, of Iowa, Republican, a prominent attorney of Cedar Rapids.

Mr. GOOD is a member of the House Committee on Appropriations, and when Vice President Buckner, of the Du Pont Trust, was testifying before this committee Mr. GOOD did not hesitate to express his disapproval of the methods of the Du Pont Co.

The Powder Trust, like all other trusts, disposes of competition in a particular locality where a rival has the audacity to put in an appearance by lowering its prices to such an extent that its competitor must either sell out to the trust or go into bankruptcy. The temporary losses sustained in this merciless process of elimination are recovered in the form of excessive prices in other localities where competition has been effectually murdered and driven from the field. The Telephone Trust is doing the same thing to-day all over the United States.

The following colloquy is taken from the hearings on the 1912 fortifications bill hearings:

Congressman GOOD. You spoke a moment ago with regard to the methods employed by your concern regarding competition, stating that no unfair methods were used to crowd out competition. Now in what was known as the fundamental agreement you had this provision:

"That any party hereto who shall suffer excessive loss by an overt act of the board of trade—as, for instance, the reduction of a price, at a place in treatment of a local disturbance of trade—shall receive compensation for the damage it shall sustain by payment of money as may be agreed upon at a general meeting of the board of trade."

Now, if I understand the testimony in the Government case correctly, a plan was resorted to whereby a very low price was made on the output of a powder manufacturer within a certain limit or in a certain locality, as against a mill that was in competition, and that the mill making the low price, as against the mill that it was desired to put out of business, was directed to make a very low price, and then that mill, in turn, was compensated for damages it sustained that were provided for by the board of trade. Now, to a layman it does not seem that these methods were hardly what would be called fair.

Col. BUCKNER. I know nothing about those methods and nothing about the operations of that committee. I am not familiar with what was done back in the time of these agreements. I know that Mr. Waddell has made all such charges as that. While there may have been such agreement, whether they were put in operation or not I have no knowledge of whatever, because it is entirely without my province ever since I have been in the company. My business for the company has been entirely with the Government, and I have had nothing to do with the commercial business.

Congressman GOOD. This provision I have just read I took from the Government's records in the trust case against your company, and from a reading of that record I was convinced that these practices were resorted to until one by one practically all of the powder companies were brought into subjection.

The Mr. Landis referred to by Mr. Buckner is Hon. C. B. Landis, an ex-Member of Congress from Indiana.

The Gen. Humphrey referred to in the testimony of the vice president of the Du Pont Co. as being employed in Washington by the powder company to "look after such little details as getting information from all of the departments," is Maj. Gen. Charles F. Humphrey, retired, who, *although representing the Powder Trust*, still draws a salary of $6,000 a year from the Government as a retired Army officer.

On the subject of retired naval officers taking employment with concerns having dealings with the Government, the Senate Committee on Naval Affairs, following its discovery of a great deal of this practice in 1896–97, had the following to say in its report made to the Senate on February 11, 1897:

No man can well serve two masters, and if contractors having large dealings with a department of the Government can take into their employment, with no limit as to compensation, officials of that department, and through them learn the secrets and the purposes of the department, and, moreover, insidiously influence its action, great injury may result to the public service. The fundamental principle upon which all legitimate business is transacted—that each side shall be represented solely by persons wholly devoted to its own interests—is viciously violated by a custom which allows one side to take into its pecuniary employment a representative of the other side.

An effort was made in the debate to draw a distinction between officers on the active list and officers on the retired list. The committee deny that any well-founded distinction exists which ought to influence the decision of the question. Retired officers of the Navy remain officers to all intents and purposes, with an important exception. Section 1462 of the Revised Statutes provides that "no officer on the retired list of the Navy shall be employed on active duty except in time of war."

But notwithstanding this statute exempts retired officers from all obligation to render any service for the liberal retired pay which they receive for life, amounting usually to three-fourths of their active duty pay, yet they remain a part of the Navy of the United States, available in any emergency of war. They are entitled to wear their uniforms on public occasions and are allowed free access to every bureau of the Navy Department, on the theory that they are still ready to serve the interests of the Government by fidelity, sound advice, and an earnest spirit of devotion to public duty. It is quite enough to allow such officers to enter into ordinary private employment for compensation. To permit them to take sides against the Government and to enter into the employ of contractors having dealings with the Government reaching to millions of dollars will certainly, if the custom continues, become most pernicious and injurious to the public interests. Proclaim that such officers may be so employed by repealing the clause which has now become a law, and a bold and wealthy contractor, willing to spend enough money to take into his employ a sufficient number of naval officers on the active and retired list, would be able thoroughly to weaken the department in its dealings with such contractor and to put the Government at his mercy in making bargains, which would be substantially entered into with the representatives of one side alone conducting all the negotiations.

Gen. Humphrey is one of the most distinguished of our officers, as the following from Who's Who, 1914, will show:

Humphrey, Charles Frederic: Major General United States Army; born, New York, September 2, 1844; private, corporal, sergeant, and first sergeant Company E, Fifth Artillery, March 17, 1863 to June 28, 1866; command, second lieutenant Fifth Artillery, May 8, 1866; transferred to the Fourth Artillery October 23, 1866; first lieutenant, May 21, 1868; graduated Artillery School, 1874; captain, assistant quartermaster, June 23, 1879; major, quartermaster, December 11, 1892; lieutenant colonel, deputy quartermaster general, October 15, 1897; colonel, quartermaster Volunteers, July 7 to September 20, 1898; brigadier general, September 21, 1898; honorably discharged from Volunteer Service June 12, 1899; colonel, assistant quartermaster general, October 26, 1901; brigadier general, quartermaster general United States Army, April 12, 1903; major general and retired after over 44 years' service, July 1, 1907. Served in the following Indian campaigns; Nez Perce, 1877; Snake Bannock, 1878; Sioux, 1890–91; Shoshone-Snake, 1895. Breveted captain, February 27, 1890, "for gallant service in action against Indians" at Clearwater, Idaho, July 11, 1877. Awarded congressional medal of honor, March 22, 1897, "for most distinguished gallantry" in action at Clearwater, Idaho, July 11, 1877, when he voluntarily and successfully conducted, in the face of a withering fire, a party which recovered possession of an abandoned howitzer and two gatling guns lying between the lines and within a few yards of the Indians, while serving as first lieutenant, Fourth United States Artillery. Was chief quartermaster, Santiago de Cuba Expedition, 1898; Division of Cuba, 1898–99; Chinese Relief Expedition, 1900–1901; Philippines, 1901–1903. Address: War Department, Washington.

BUSINESS RELATIONS BETWEEN ARMY OFFICER AND BETHLEHEM CO.

When the Army bill was before the House on June 13, 1914, I called attention to the fact that Brig. Gen. William Crozier, the present Chief of Ordnance, was formerly in partnership with the Bethlehem Iron Co., now the Bethlehem Steel Co., one of the great firms composing the war trust.

His remarkable promotion over 27 officers of greater age and longer service, his clean jump over three entire grades—major, lieutenant colonel, and colonel—to his present position, in which he determines the specifications, arranges the terms of contracts, and makes the purchases of powder, guns, shrapnel, and all other military supplies for the Ordnance Department, furnishes an excellent illustration of the rapid advancement possible to officers who make themselves agreeable to and are on friendly terms with the war traders.

While a captain in the Army, Gen. Crozier perfected what is known as the Buffington-Crozier disappearing gun carriage. The gun was constructed in Government gunshops by Government workmen at Government expense, hundreds of thousands of dollars being used to perfect the carriage.

When the device was perfected a patent was taken out on it by Capt. Crozier and Gen. Buffington—then Chief of Ordnance—in their own names. The application for the patent was made by Capt. Crozier and Gen. Buffington at the suggestion of the Bethlehem Co.

In 1894 the two officers sold the patent to the Bethlehem Co., giving them the rights as against all makers or users except the Government of the United States. (See S. Doc. 387, 1st sess. 57th Cong.)

The two officers were paid $10,000 cash by the Bethlehem Co., which concern further agreed to pay Capt. Crozier and Gen. Buffington royalties on all gun carriages sold to foreign nations until the same should amount to $40,000 or $50,000 in all. The amount of the royalties was to be as follows:

For each 8-inch carriage	$1,000
For each 10-inch carriage	1,500
For each 12-inch carriage	2,300

It was claimed at that time the disappearing carriages would revolutionize warfare, and the prospect for a big sale of the carriages seemed bright. The fact that the Bethlehem Co. owned the patent meant that all countries desiring to purchase the carriages would be compelled to purchase from Bethlehem and pay the Bethlehem price, although the United States Government was left free to manufacture them in its arsenals if it chose.

Immediately after the contract was entered into, I am informed, the Bethlehem Co. sent agents to Europe to reap the harvest. Various European nations, according to my information, tested the gun carriages, but none would buy, not believing them practical. Many American officers had also expressed doubt as to the practicability of the invention. Senator Redfield Proctor, of Vermont, ex-Secretary of War and then acting chairman of the Military Affairs Committee, gave the carriage much adverse publicity in the Senate at the time. (See CONGRESSIONAL RECORD, pp. 5409–5414, pt. 6, vol. 35, 57th Cong.)

Capt. Crozier was still a party to the contract with the Bethlehem Co., when, to the amazement of Army circles, he was nominated in March, 1902, for the position of Chief of Ordnance.

This advancement meant a jump over the heads of 27 officers and three grades, which was a violation of at least the spirit of an act approved February 2, 1901, "An act to increase the efficiency of the permanent military establishment of the United States," which provided:

That when vacancies shall occur in the position of chief of any staff corps or department the President may appoint to such vacancies, by and with the advice and consent of the Senate, officers of the Army at large not below the rank of lieutenant colonel, and who shall hold office for terms of four years.

The rank of captain is the next grade below that of lieutenant colonel.

HOLDS OFFICE IN VIOLATION OF LAW.

Appointment to the position of Chief of Ordnance also made Capt. Crozier a member of the Board of Ordnance and Fortification, and his appointment therefore was in direct violation of an act approved February 18, 1893, which contained the following:

Provided, That hereafter no person shall be a member of or serve on said board who has been or is in any manner interested in any invention, device, or patent which, or anything similar to which, has been considered or may be considered by or come before said board for test or adoption; or who is connected with or in the employ of any manufacturer who has or shall have contracts with the United States for any ordnance materials.

Earnest opposition was made before the Senate Committee on Military Affairs to the confirmation of Gen. Crozier's nomination. No reflection was made on Gen. Crozier's personal character or upon his efficiency. Attention was directed to the fact that he had been in partnership with the Bethlehem Co. (it was not known then that at that particular time he was a party to the contract with the Bethlehem Co., which he did not terminate until 8 months after his confirmation), from which concern, in competition with others, he would be called upon, as Chief of Ordnance, to purchase materials aggregating millions of dollars in value.

It was further contended that even if he had so arranged his affairs as to leave him no pecuniary interest whatever in his patents at home or abroad, he would still be disqualified for a position on the Board of Ordnance and Fortification or as Chief of Ordnance, where he would sit in judgment upon his own inventions and upon those of a similar character belonging to other men, because the natural pride of an inventor in his own production might prejudice him in their favor.

It was also pointed out that if his disappearing gun carriage should be O. K.'d by this Government and installed in large numbers by our Government for defense purposes it would tend to make it more attractive to foreign nations, and thus create a demand for it abroad, which would mean royalties to Gens. Crozier and Buffington.

The propriety of an officer of the United States Army offering for sale and seeking to profit by the sale to foreign nations of a weapon of defense perfected at the expense of the American people was also raised.

When in the debate on the Army bill I ventured to call attention to the fact that Gen. Crozier had formerly been in partnership with the Bethlehem Co., and that ever since his confirmation as Chief of Ordnance he had been awarding that concern contracts running into the millions annually, generously paying the Bethlehem Co. from 20 to 60 per cent more than it would have cost to manufacture such supplies in the Government arsenals, the general was eulogized as a "soldier without fear" and a halo was placed upon his head. It was stated that when his nomination had come up in the Senate he was "cleared absolutely." (See p. 10438, pt. 11, vol. 51, CONGRESSIONAL RECORD.) Thus the process reveals itself—the Army and Navy officials protecting the war trust and Members of Congress protecting the Army and Navy officials.

But let us see whether Gen. Crozier's clearance papers were "absolutely" clear, as stated to the House.

I quote the following from the official records of the Senate Committee on Military Affairs, to which body the nomination of Gen. Crozier was referred for consideration:

March 27, 1902 (p. 23): Called the attention of the committee to the nominations of Crozier, Davis, Gillespie, and others incident thereto, and after some discussions by the committee it was agreed that the committee would meet at 10.30, Thursday, April 3, to consider this matter, with a view of making a final disposition thereof.

April 3, 1902 (p. 24): Nominations of Crozier, Gillespie, Davis, et al, taken up for consideration.

Nomination of Gen. Crozier ordered reported adversely by a vote of 8 to 2.

Senators present on that day and voting: Hawley, Proctor, Burrows, Quarles, Scott, Foraker, Bate, Cockrell, Pettus, and Harris.

April 24, 1902 (p. 29): The question of the nomination of Gen. Crozier came up for careful consideration, and it was agreed that the nomination should be recommitted to the committee, and that an investigation of certain alleged charges be conducted by the full committee, of which five shall constitute a quorum. The motion was carried. It was further agreed that all these hearings should be reported.

May 29, 1902 (p. 37): At 11 o'clock a. m. the committee adjourned, to meet at 10 o'clock a. m. Saturday, the 31st instant, to take up the Crozier matter, and the clerk was instructed to notify Gen. Crozier to be near at hand if needed.

May 31, 1902 (p. 39): The Crozier nomination was taken up for consideration, and after an informal discussion of the matter it was generally agreed that the committee would defer taking any further action and leave it to be disposed of in the Senate in executive session.

COMMITTEE THAT HEARD EVIDENCE FOR AND AGAINST WAS 8 TO 2 AGAINST CONFIRMATION.

The only vote taken by the committee that heard the charges against Capt. Crozier, and his defense to the arguments in opposition to his confirmation, was a vote 8 to 2 against confirmation.

The files of the Army and Navy journals for the period during which the Crozier nomination was pending indicate that "powerful pressure," reaching even to the President of the United States, was being used to bring about the confirmation of the then Capt. Crozier as Chief of Ordnance.

In spite of the fact that effort was made to cause the members of the Senate Military Affairs Committee to change their votes and vote for confirmation, they refused, and the best compromise that could be obtained was an agreement to refer the matter back to the Senate without recommendation.

Capt. Crozier was confirmed by the Senate in executive—secret—session June 20, 1902.

It was believed that one of the concessions made by the friends of Capt. Crozier to obtain confirmation was an understanding that he would not serve as a member of the Board of Ordnance and Fortification, from membership on which he was clearly disqualified by the fact that the Patent Office records showed that he had obtained the following patents, *all* of which have "been considered" and "may be considered by or come before said board (Ordnance and Fortification, of which Gen. Crozier is a member) for test or adoption."

Patent No. 555,426, dated February 25, 1896 (jointly with A. R. Buffington), for a disappearing-gun mounting.

Patent No. 613,252, dated November 1, 1898, for a disappearing-gun mounting.

Patent No. 671,879, dated April 9, 1901, for a wire-wound gun.

The question of increasing the use of these devices, as well as their purchase, would also necessarily come before Gen. Crozier as a member of the Board of Ordnance and Fortification as well as Chief of Ordnance.

It may also have been that Capt. Crozier's defenders gave assurance that he would retire from his contract with the Bethlehem company. At any rate, for a brief period, and an exceedingly brief period, Gen. Crozier did not serve as a member of the Board of Ordnance and Fortification, although he has now been a member of the board for more than 10 years.

Since the Bethlehem company had been unable to sell any disappearing-gun carriages to foreign nations in nine years, which meant no royalties to Gen. Crozier, he sacrificed little when he withdrew from the contract in the following manner:

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ORDNANCE,
Washington, January 15, 1903.

The BETHLEHEM STEEL CO.,
South Bethlehem, Pa.

GENTLEMEN: 1. Referring to the agreement between the Bethlehem Iron Co. and myself, for myself and also as attorney for Gen. (then Col.) A. R. Buffington, which appears in my letter of September 6, 1894, and your answer thereto of September 10 of the same year, I wish now to inform you that I hereby release the Bethlehem Iron Co. and its successors from all obligations to myself in consequence of such agreement; that is, that I hereby assign all my right, title, and interest in the invention which has been commonly known as the Buffington-Crozier disappearing carriage, and in all letters patent relating thereto, to the Bethlehem Iron Co. and its successors, without any further consideration or compensation whatsoever to be paid to myself or to any other person in my behalf, my object being to relinquish fully and totally all personal interest in this invention.

2. Nothing in this letter is, however, to be understood as affecting the right or interest or compensation of Gen. Buffington in regard to this invention or any rights of the United States therein.

Very respectfully,

WILLIAM CROZIER,
Brigadier General, Chief of Ordnance.

This letter did not release the Bethlehem company from the payment of royalties to Gen. Buffington, Gen. Crozier's partner, in the event the Bethlehem company should be able to find foreign purchasers for the carriage.

In the meantime the War Department has installed $9,000,000 worth of the Buffington-Crozier carriages.

INVENTIONS PERFECTED WITH AMERICAN TAXPAYERS' MONEY SHOULD NOT BE OFFERED TO FOREIGN NATIONS.

I do not desire to do Gen. Crozier the slightest injustice, and on the other hand I am equally anxious that he do no injustice to the taxpayers of this country, 90 per cent of whom are the poor, and 99 per cent of whom are kept too busy looking after their private affairs to give personal attention to the manner in which their money is being expended in Washington, and who rely upon their paid Representatives in Congress to look after their interests. The Buffington-Crozier disappearing car-

riages may be as deadly in warfare as Gen. Crozier claims, and their purchase and manufacture by this Government through Gen. Crozier may be an excellent investment. I do not know.

What I take particular exception to, and what I believe the American people would take exception to if they knew of these facts, is that Army officers should have any business connection whatever with the ammunition ring, and that instruments of war perfected as a result of the expenditure of money raised by taxing the American people should be even offered to foreign Governments by an American Army officer.

If this Nation should engage in war with nations equipped with such weapons, American sailors and soldiers would be mowed down with engines of death perfected with the American people's money.

What is the use of this Government spending huge sums to perfect guns if after they are perfected they are to be offered for sale to foreign nations, any one of which may possibly become our enemy?

SOME OFFICERS HAVE BEEN IN POWER AT HEADQUARTERS TOO LONG; TOO CLOSE AN INTIMACY HAS GROWN UP WITH AMMUNITION CONTRACTORS.

When a political party is in power too long, it becomes careless of the people's rights. An organization grows up that is not for the best interests of the public.

Occasionally, however, political parties are taken out of power, and the organization is thus broken up. But in the Army and Navy the machine goes on building forever. It has $240,000,000 to spend every year. Army and Navy officers never have to go before the people and answer for their acts. There has never been a real investigation of the business methods of the War and Navy Departments, and no doubt those in charge figure that because there never has been there never will be. It is but natural if carelessness in the spending of the people's money has resulted.

When a new Secretary comes in he knows absolutely nothing about the business of the department. Perhaps he is a lawyer, or perhaps a banker. The officers at the top upon whom he must depend for his information start in immediately to capture him to their viewpoints and policies, and invariably they succeed. Daniels is an exception. This golden circle of officials who surround the new Secretary are not going to allow him to change their policies if they can help it, and they see that he gets only such information as is deemed expedient. To admit that any important change should be made is to admit they have not been doing things right, or that they have made a mistake.

ARMY OFFICERS DO NOT VOLUNTEER INFORMATION.

Ever since my election two years ago I have been endeavoring to obtain facts relative to the expenditure of Army and Navy appropriations. My very first visit with the Army officers at the War Department convinced me that I had an uphill journey ahead of me. Any request for information was resented as an attempt to pry into the personal affairs of Army officers. Every possible obstruction was placed in the way, and one letter remained unanswered for two months.

A CONGRESSMAN'S PRINCIPAL VALUE IS TO APPROPRIATE MONEY.

The small group of Army officers who are running things care very little about the average Member of Congress. These officers want no interference, and least of all close scrutiny of the prices they pay for ammunition, either by Mr. Congressman or anyone else.

The Army and Navy officers who run things were in the saddle long before the inexperienced Member of Congress came on the scene, and will no doubt be on the job a long time after he has taken his departure.

ARMOR MANUFACTURERS ARE CONSIDERATE OF MILITARY OFFICIALS.

Military officials have frequent opportunity to come in contact with the officers and agents of powder, armor, and gun making concerns, and, of course, the war trafficking firms treat them nicely and show them every consideration, as they should. The following order is characteristic of those frequently appearing in the Army and Navy Journal:

ORDNANCE DEPARTMENT.

BRIG. GEN. W. CROZIER, C. O.

Col. Rogers Birnie, Maj. Clarence C. Williams, and Maj. Edward P. O'Hern, O. D., will proceed to the works of the Midvale Steel Co., Philadelphia, Pa., for the purpose of attending a meeting of the joint Army and Navy board on gun forgings on or about March 12, 1914. (Mar. 5, War D.)

Just how far the armor concerns in this country go in entertaining Army and Navy officials would be interesting to know. It is well known that the Krupp concern in Germany spends a large sum of money for the entertainment of visiting military officers, who come to the big works at Essen from all countries of the world commissioned to pass for payment work ordered by their Governments.

While making arrangements to arm against each other, and perhaps to destroy one another, the representatives of the war offices of the world do not regard one another with distrust, but instead turn in and make merry together. The firm of Krupps, whose customers the army officers are, has built a hotel, the Essen Hotel (Essener Hof), where the officers receive princely hospitality at its expense.

"This Krupp hotel," writes M. Jules Huret, who was a guest there, "is a very curious place. With its double marble staircase, with columns of rose-colored marble and banisters of gilded copper, it has dignity. In the vestibule, on either side of a vast stone chimney piece, sculptured masks represent the five continents. The ground is covered with red tiles, along which carpets are run; red leather settees and armchairs are lined along the walls. The guests of the firm dine in a special hall. * * * After a few days they all know one another and they soon meet around a large round table. Nothing could show better than these occasions how much that is artificial our civilization contains. Turks, Bulgars, Serbs, Japs, Chilean, and Argentina and Philippine representatives will be there.

"There will also be Scandinavians, Russians, Belgians. At the end of the meal, when the French wines have got a little into their heads, the voices will rise, and all these enemies will clink glasses for a long time like brothers, amid laughter and the smoke of long cigars, at the cost of the Krupps—a thousand leagues from the thought of the reasons that brought them there. All these gentry will perhaps be slaughtering one another one fine day with these guns which they have come to see bored. But while they are waiting for the steel to cool they 'booze,' as William II said to Jules Simon.

"Some of these representatives stay a year, even two years, to watch the processes of manufacture, so that with its 50 rooms the 'Essen Hotel' costs the firm something like £20,000 a year, without counting incidental expenses. This year, for instance, when the Chinese mission arrived—18 persons, with their attendants—there was an insufficiency of accommodation. Frau Krupp invited the Turkish officers, whom she had been harboring for a long time, to make a little journey to London and Paris at her expense, under the guidance of a young officer attached to the works. They stayed away five days, enjoyed themselves as may be imagined, and returned when the Celestials had gone again. The stay of the Chinamen themselves had cost £2,000—special trains, banquets, etc."

GOVERNMENT MANUFACTURE OF WAR SUPPLIES IS THE ONLY SURE METHOD OF PROTECTING TAXPAYERS FROM MILITARY EXTRAVAGANCE.

Before I was elected to Congress I found entertainment and instruction sitting in the public gallery of the House and Senate listening to the debates each year on the Army and Navy bills. I heard those opposed to the ever and ever increasing appropriations for militarism call attention to the coincidence that each year about the time these bills would come up with their staggering sums for preparation for war in time of peace there would appear in the newspapers war scares and rumors of increased preparation for war by our presumed enemies. Year after year I heard it charged and repeated in the Halls of Congress that these newspaper articles, all more or less of mysterious origin, were circulated to arouse the country to a sense of impending danger which did not exist, and indirectly to influence Congress to increase the appropriations for the Army and Navy. Those who were opposing the colossal Army and Navy programs asserted their belief that the principal demand for increased armament did not come from the masses who pay the bills, but from the armor and ammunition manufacturers, who anticipated huge profits in supplying the same, and the success of whose business depends upon large preparations for war. It occurred to me, as I sat in the galleries listening to these arguments, that if they were well founded, as I then believed they were and am more than ever convinced now, the easy and practical solution of the problem would be for the Government to take the profit out of war and preparation for war. Yet I never heard any of the debaters suggest the taking of the profit out of the war game as the solution of the problem. Nationalization of the manufacture of the munitions of war offers a program on which everybody, whether in favor of disarmament, increased armament, or maintaining the present armament, can meet on a common ground. Those who desire greater armament can get it at little more than one-half the cost of private manufacture.

It is argued by some who oppose complete Government manufacture as a policy that the Government should give to private manufacturers such an amount of work "as will justify them in keeping up plants which would be of inestimable value to the Government in case necessity arises." This is not a reason for the present wasteful policy, merely an excuse.

By complete Government manufacture the Government could save enough money annually to buy a plant equal to that of the largest private concern. In a few years the Government could save enough by complete Government manufacture to own all of the plants in the country and have the munitions and ships which would have been purchased in those years as well.

It can scarcely be argued that the Government could place more dependence during war upon a privately owned plant than upon a Government-owned plant if capacity was equal. The advantage would be on the side of Government manufacture, because the Government-owned plant could not increase the cost of its products in time of war when the Government is at its mercy, as the Armor and Powder Trusts did during the Spanish War.

Both France and Russia have Government armor plants. In the matter of cost the Russian Government claims to be able to produce armor at a saving of about $200 a ton over the prices asked by the private manufacturers, and the French Government estimates that an equal saving has already been made on the thin plates, which is the only grade so far manufactured.

Japan has built two Government factories, and, while it is not known outside of that country just what has been done, it is believed that they are successful, although no figures can be obtained as to the cost of the armor they turn out. These plants were installed under the direction of Americans who had learned their trade at the American armor-making plants.

When all profit is taken out of war and preparation for war, but not until then, we may expect relief from the systematic agitation now being carried on by the Navy League and other friends of the armor ring, the ammunition ring, and the Shipbuilding Trust for an ever and ever increased amount of armament, which agitation is especially systematic and pronounced about the time the Army and Navy bills are before Congress each year. Should the Government manufacture all of its munitions, I predict that the Navy League would not only lock the doors of its suite in the National Capitol, from which it carries on its lobbying morning, noon, and night, but that the same patriots for profit who are now clamoring for a bigger and bigger Navy, in the certain knowledge that if their agitation is successful they will draw down contracts worth millions, will be among the loudest in their protestations against an annual expenditure of $250,000,000 for war in time of peace. Later I will identify some of the men back of the league and mention their business connections to show why I think they would be likely to close up their busy little lobby headquarters in Washington if Uncle Sam should determine to nationalize the manufacture of everything pertaining to war.

PRIVATE OWNERSHIP OF ARMOR AND MUNITION FACTORIES IS A STANDING MENACE TO PEACE.

Every man who opposes war and favors peace can support a policy of Government manufacture, because as long as these hydra-headed capitalistic cliques which thrive and fatten on international distrust and suspicion remain in our midst we are in danger, not so much from the peoples beyond the seas as from the war traders at home, who, if permitted to ply their trade to its final analysis, will lead us to the very brink of desolation and then, to satisfy their sordid greed of gold, plunge us headlong into the bottomless abyss of war itself.

Permit me here to quote the words of Minority Leader OSCAR W. UNDERWOOD, uttered in the debate on the Naval bill in the House of February 5, 1915:

I believe we ought to have a reasonable Navy and a reasonable Army, but I do not want to see my country have either a Navy or an Army that will invite us to make issues that may precipitate our people into the caldron of bloodshed and disaster. [Applause.] I believe that if you propose to enter into a race of armaments the end of the story will mean war. [Applause.]

INCREASE IN COST OF NAVY IS ABNORMAL.

The increase in the cost of our Army and Navy in the last 20 years is enough to stagger the imagination and bewilder the senses. The cost of our Army and Navy is greater in proportion to its size than that of any other nation on earth. The increase in cost is absolutely abnormal when considered in proportion to the increase in our population, or the increase in wealth, or when considered with the increased cost of preparation for war in other countries in time of peace. In this connection it is legitimate to ask to what extent the awful increase in cost is due to the systematic agitating of the possibility of war by those who profit financially from the ever-increasing expenditures of the military branches of our Government.

In the last 30 years our population has increased 85 per cent, our wealth 185 per cent, and our expenditures 400 per cent.

During the 15 years prior to the Spanish-American War our annual appropriations for the Navy ranged from $14,000,000 to $30,000,000, and for the Army less than $25,000,000, averaging for both less than $50,000,000.

In 1883 our appropriation for the Navy was $14,903,559; in 1890, approximately $20,000,000; in 1914, $140,000,000! Our appropriations for the Army and Navy combined for the ensuing year will be in the neighborhood of $240,000,000.

During the year 1912 our entire revenue, not including postal receipts, amounted to $702,000,000. Of this we expended $654,000,000 to defray the entire expense of the Government; $444,000,000, or 67.88 per cent, was paid out for war and on account of war. Just before the outbreak of the present European war Germany was spending 55 per cent of her revenues for war and on account of war; Japan, 45 per cent; Great Britain, 37 per cent; and France, 35 per cent.

Our Army contained 91,416 men; Navy, 52,757 men. German Army, during the year indicated, contained 870,000 men; navy, 66,783 men. Japan: Army, 250,000 men; navy, 51,054 men, with a reserve naval force of 114,000 men. Great Britain: Army, 254,500 men; navy, 137,500 men. France: Army, 720,000 men; navy, 60,621 men.

Great Britain's revenue was greater than ours by nearly $300,000,000, but our expenses for war and on account of war was more than $100,000,000 greater than hers. Yet the aggregate of her army and navy was nearly four times as great as ours.

Germany's revenue exceeded ours by $60,000,000, but our expenditures for war and on account of wars exceed hers by more than $50,000,000, yet her army is more than eight times as large as ours.

The revenue of France is more than $233,000,000 greater than ours, but our expenses for war and on account of wars is nearly $150,000,000 more than hers, notwithstanding her army is eight times as large as ours and her navy excels ours by 10,000 men.

Although our revenue is nearly two and one-half times that of Japan, yet her army is nearly three times as large as ours, with a naval force nearly four times the size of ours, yet our expenses for war and on account of wars is more than three and one-half times that of hers.

How the cost of our Navy is soaring.

1883	$14,903,559
1893	23,543,267
1894	22,104,061
1898	33,003,234
1899	56,098,783
1900	48,099,969
1903	78,856,363
1908	98,958,507
1909	122,662,485
1910	136,935,199
1911	131,410,568
1912	126,405,509
1913	123,151,538
1914	140,718,434

It is interesting to note that the per capita appropriations by Congress for all purposes is climbing up just about in proportion to the increased cost of the Navy, as the following figures will

Year.	Navy appropriations.	All appropriations per capita.
1890	$20,000,000	$6.15
1900	48,000,000	9.05
1912	126,000,000	10.73
1914	140,000,000	11.09

It is pertinent to inquire where the millions that have been poured into militarism to the enrichment of the armor and ammunition capitalists came from. These millions were not picked up in the streets, and they were not contributed by the rich. Our citizens have not contributed in proportion to their wealth but the poor man has paid on an average almost as much as the rich; and since there are 99 poor to every rich man, it means that the millions that have piled up in the pockets of the armor-plate magnates have come from the pockets of the poor.

And this is the feature of militarism-gone-mad that strikes home—the fact that the wasted millions did not come from an income tax or inheritance tax levied on those best able to bear the burden, none of it having been collected by a direct tax, but that practically every penny of the $2,000,000,000 expended on the Army and Navy in the last 10 years came through the customhouses and the internal-revenue offices. Since customhouses and internal-revenue offices do not levy taxes on men according to their wealth or ability to pay, but solely upon things the people eat, wear, and use, it means that the people pay the armor-plate makers' bills in the increased cost of living.

Therefore it is but logical that the cost of living must increase in proportion to the cost of militarism—and it does, as the table heretofore given shows beyond successful contradiction. The people may as well know that as the cost of militarism increases in the future so will the cost of living.

To make clearer my statement that the poor man has been paying almost as much toward defraying the expenses of the Federal Government as the rich man, permit me to correct the impression of the average person that some part of the taxes he has been paying to his local tax collector has been sent to Washington for the purpose of maintaining the Federal Government. The truth is that not one penny of the taxes we have been paying our local tax collectors has come to Washington. Every penny of such taxes has gone toward defraying the expenses of township, city, county, and State. Therefore if a millionaire pays a heavy State tax none of it goes toward defraying the cost of the Army and Navy or maintaining the Federal Government. The manner in which the people have been supporting the Army and Navy and meeting all other Federal expenses has been by paying increased prices for things eaten, worn, or used. The local grocer and dry-goods merchant has been the Federal tax collector without knowing it or without his average customer knowing it. To the extent that the average poor man eats the same amount of food as the rich man he has been paying as much tax. Funds for the maintenance of the Army and Navy, as well as all other Federal expenses, have thus in the past been raised wholly in the form of increased cost of living.

It is true, of course, that we now have an income-tax law on the statutes, and this will help some; but until the tax on incomes in excess of $10,000 annually is increased much above the present rates, and until there is a stiff Federal inheritance-tax law, so that those who derive the greatest benefit from military expenditure will bear the heaviest burden of their cost, as they should, the poor man will continue to carry the heaviest load in proportion to his ability to pay, just as he always has done and just as the stone in the bottom of the wall bears more weight than its more fortunate brethren on the top.

GET READY TO PAY IN EARNEST FROM NOW ON.

Two billion dollars have been collected in 10 years from the men, women, and children of our Nation for militarism, a sum sufficient to dig the Panama Canal, pay off the national debt, with enough left to defray for one whole year the entire expenses of all the churches, including foreign missions, all the free schools, colleges, and universities in America.

And the end is not yet. The war traffickers have not finished reaping their harvest; they are just getting in good trim to make us pay the cost of militarism in real earnest. American people, listen to this little colloquy which occurred recently at one of the hearings of the Naval Affairs Committee between Representative FINLY GRAY, of Indiana, and Admiral Vreeland, a big-Navy booster:

"Mr. GRAY. I wish to inquire of the admiral if it is not the policy of other Governments to increase their navies with all the other leading powers?

"Admiral VREELAND. It is, sir.

"Mr. GRAY. What would be the advantage to us or any other powers if the navies were increased equally by all the nations of the world? Would there be any advantage to us or to any other power?

"Admiral VREELAND. Not if you mean in the same ratio.

"Mr. GRAY. Would not the same grounds exist after an increase for a further increase?

"Admiral VREELAND. It would seem so.

"Mr. GRAY. There would be no advantage gained by any nation, then. How long could that be maintained, that even increase, and what advantage would it be to any nation?

"Admiral VREELAND. If it continues to increase, the poorer nation will eventually exhaust itself, and then the other nations, the United States included, will have a free hand—I mean be free to build in accordance with the changed conditions.

"Mr. GRAY. Then it is only a question of the limit of taxation?

"Admiral VREELAND. Yes, sir."

In other words, the only thing that the international war trust has to fear on the score of reduction of profits is the limit of the ability of men, women, and children to keep on paying the ever and ever increasing per capita appropriation tax in the form of higher prices for foodstuffs and wearing apparel. This is certainly a bright prospect for the Armor, Powder, Battleship, and Ammunition Trusts. But for the taxpayers the prospects are not so bright.

If the taxpayers of the world want to escape being forced to pay higher and higher taxes until they get so high they simply can not pay them; there is but one thing to do, and that is for the people of all the nations to insist that their Governments manufacture their own munitions of war.

If the millionaire and multimillionaire war-trust magnates can not make huge profits in supplying the armor, guns, powder, and battleships, they will take the same attitude toward the wasting of public funds that the rest of us do.

TESTIMONY BEFORE SENATE LOBBY COMMITTEE.

United States Senator GEORGE T. OLIVER, of Pennsylvania, testified before the Senate lobby investigation committee that he owned 1,000 shares of stock in the United States Steel Corporation and held a "considerable" interest in copper mining. He testified he also owned 7,700 shares in the Pittsburgh Coal Co. and two newspapers—the Pittsburgh Gazette-Times and the Pittsburgh Chronicle-Telegraph. Increased armament requires great quantities of both copper and coal.

The United States Steel Corporation is the owner of the Carnegie Steel Co., which concern has obtained $32,000,000 worth of contracts from the Navy Department for armor alone, and other millions of dollars' worth of contracts for other materials used in the increasing of the Army and Navy.

On February 2, 1915, one of Senator OLIVER'S newspapers editorially asked:

"But what is meant by that resounding mouthful "disarmament by the United States?" Isn't it the fact that the United States is pretty well disarmed as matters stand? * * * There isn't much sense in talking of the United States disarming before it is armed.

THE ARMOR RING AS EMPLOYERS OF LABOR.

The concerns comprising the armor ring are notorious as being among the most bitter enemies of organized labor in the United States, and reports following investigations of conditions in the plants reveal that they are cruel and inhuman in their treatment of unorganized labor. Is this language too strong? The findings of the investigating committees themselves will afford the best answer to this query.

A survey of living conditions in Pittsburgh was made in 1909 by the Sage Foundation under the direction of especially qualified investigators, who collected their material at first hand in the mill and in the home. It had from first to last the hearty support of such prominent citizens of Pittsburgh as Mayor George W. Guthrie; President H. D. W. English, of the Civic Improvement Commission; Judge Joseph Buffington, of the United States circuit court; and W. H. Matthews, of the famous Kingsley House.

Edwin Bjorkman, a magazine writer, was furnished with the material gathered by the foundation and presented its findings in condensed form in the World's Work for April, 1909. I quote the following from Mr. Bjorkman's résume of the Sage Foundation report:

The Carnegie Steel Company employs about 23,000 workers within the district. Concerning the foreign born among these, some very instructive statistics are available. They number in all 17,340, or three workers out of four in the whole force. Together they represent more than 20 distinct nationalities, most of which in turn embrace from 3 to 20 racial or lingual subdivisions. Considering only the predominant elements, we find * * * 14,000 Austrians, Hungarians, Italians, and Russians, * * * among every hundred of whom there are 82 unskilled, 15 semiskilled, and only 3 skilled workers.

* * * * * * *

Mentally they rank low. Education or training they have none. But morally they can hardly be called undesirable. They prove submissive, dependable, willing workers, who never dream of questioning the desirability or the dignity of the task assigned to them, and who are rendered oblivious to danger by their ignorance. Having worked 14 and 16 hours a day in their native countries, and having been paid from 25 to 50 cents for such slavery they think little of working 12 hours a day and find a fortune in $2 thus earned.

* * * * * * *

To the English-speaking people these men with unpronounceable names and strange ways are just "Hunkies"—dumb, dull, driven brutes, so utterly beneath contempt that even competition with them is out of the question. Wherever they get in, the natives and the northerners withdraw. Wherever the latter find conditions too hard or wages too low, the "Hunkies" apply eagerly. Everywhere they have been kept at the bottom so far. The worst jobs, and only these, are for them. But still they are coming in ever greater numbers, and by slow degrees they are pushing upward—steadily, inevitably as fate itself. Amid the clatter of their unintelligible tongues the few, and ever fewer, English-speaking foremen and skilled workers feel as lonesome as lighthouses. And this chasm between hostile castes of workers serves, by the by, to make unionism additionally impossible.

* * * * * * *

There used to be big money for the workers who handled iron and steel. There is still fairly good money to be made by a very few of them. But for 15 years the cutting of wages has been going on until to-day in many cases the best workers make less than half of what they used to earn. It has been figured out that every hundred workers in the steel mills and blast furnaces includes 60 men who make less than $2 a day, and only two who make more than $5 in the same time. The average daily wages of Allegheny County's 9,000 blast-furnace men were found to be below $2.50 in 1907. In October of that year the entire force of 12-hour men in the open-hearth department of the Homestead Steel Works was averaging $2.76 a day. The highest paid skilled workers in some of the most important branches of the steel industry are incapable of earning more than $3.75 a day.

The main thing asked of the worker is speed, or, maybe one ought to say, speed without waste. To the achievement of this result everything

is adapted, but, above all, the wage schedules. The underlying idea of the whole system is to get more out of a man by paying him less. Its fundamental rule is that if the man drives the machine he is paid by the piece; if the machine drives him he is paid for time. A trick constantly practiced is to urge the workers into exceeding their previous capacity for the purpose of earning more and then to adapt the wage rate to the new record in order that they may work still harder to retain their old earnings. This has proved one of the most effective means of increasing the output.

* * * * * * * * *

Among 16,000 men employed in the three largest plants of the United States Steel Corporation in 1907 there were 120 men working only eight hours a day. * * * Among the steel and iron workers the 12-hour day is practically law now, so that, for instance, there were only ninety-three 10-hour men to one thousand five hundred and seventeen 12-hour men at the Homestead Steel Works in 1907.

This law, slightly modified—and modified largely for the worse—holds good seven days of the week all the year through. Neither Sundays nor holidays exist for these toilers. Once every fortnight they work 24 hours in a stretch in order that they may have a full day of 24 hours free the next week.

MR. WORKINGMAN, HOW LONG DO YOU PROPOSE TO STAND FOR THIS?

Thanks to an investigation of the Bethlehem Steel Co.'s strike in 1910, information is available as to conditions of labor in that armor-making concern's plants. The inquiry was made by the United States Bureau of Labor in 1910, under the direction of Ethelbert Stewart, a special agent of the Labor Bureau at the time, who bore the reputation of being one of the most experienced economic investigators in the country.

When this strike began there were no labor organizations in the plant; the company would not permit them. It was the higher grade workers who led off in the strike. Many of the highest-grade men had approximately a 10½-hour day. But they were frequently being required to work overtime on week days and to do additional work on Sundays. Fearing that the encroachments of overtime and Sunday work were leading to a 12-hour and 7-day schedule for the whole force, they therefore protested. Therefore the protesting committee was discharged; therefore the strike.

The Government investigation revealed this:

That out of every 100 men 29 were working 7 days every week.

That out of every 100 men 43, including these 29, were working some Sundays in the month.

That out of every 100 men 51 were working 12 hours a day.

That out of every 100 men 25 were working 12 hours a day 7 days a week.

That out of every 100 men 46 were earning less than $2 a day.

These are the grim figures which the United States Bureau of Labor gives us of the working shifts of the Bethlehem Steel Co. as drawn from the company's own time books. This is the manner in which the concerns that have drawn down $175,000,000 of the people's money were treating their employees in 1910. Since that time considerable 8-hour-day legislation has been passed, and there is no record of the number of 12-hour shifts now in force.

Workingmen of the Nation, are you willing that your Government shall continue to give contracts running into the millions annually to firms that have mistreated and underpaid their employees as have these great war trafficking concerns? If you are not willing, then protest against it. But let me assure you at the outset that one protest will not be sufficient. The chances are you will have to speak loud and often before your voice will be heard in far-off Washington.

ENTER MR. ANDREW CARNEGIE, PATRIOT.

One of the strongest arguments in favor of a policy of complete Government manufacture of all munitions of war is that such a policy will remove all incentive for the defrauding of the Government by private manufacturers. The war trust has never hesitated to cheat the Government when it found an opportunity to do so, and it has managed to find the opportunities. It is probable that the exact extent of the frauds that have been perpetrated upon the Government by the war trust will never be known, because it has been only by sheer accident that such frauds have become public in a few instances.

A proposition has been made to Secretary Daniels, however, that if he will agree to reward those who furnish the evidence of extensive armor-plate swindles with a certain percentage of the sums recovered from the armor ring as a result of such information that it will be forthcoming. Those who have made this proposition to the Secretary state that the men who have such information have dealings with the armor concerns, and that others who would testify are in the employment of the armor manufacturers, and that they can not sacrifice their interests and means of livelihood without some kind of protection. Since there would be no cost to the Government unless it was able to actually recover fines from the armor patriots, it can not be seen how the Government can well refuse this proposition. There is little doubt but that the Government has paid high prices for inferior and "doctored" and defective armor plates, guns, and gun forgings in scores of instances without the same being detected.

Any discussion as to armor frauds necessitates the mention of one of our prominent millionaires who travels about the country posing as a great patriot—Mr. Andrew Carnegie, who holds $300,000,000 worth of bonds in the United States Steel Corporation, which in turn owns the Carnegie and other war-trafficking subsidiaries, which never hesitate to take advantage of their strangle hold of our Army and Navy, Mr. Carnegie's protestations of patriotism notwithstanding. Mr. Carnegie's slice of pork resulting from his $300,000,000 worth of bonds amounts to approximately $16,000,000 annually. The American taxpayers contribute the greater portion of this in the form of increased cost of living.

On January 7, 1911, Mr. Carnegie made a speech before the Republican Club in New York City, in which he told how he came to go into the armor-plate business.

I was coaching in Scotland—

He said—

when I got a cablegram from Secretary Tracy—

This is the same Secretary of the Navy Tracy who, after leaving the Government service, became the attorney for the Carnegie Co.—

saying in effect, "the President says he understands it to be your duty to enter into the manufacture of armor and save the ships from waiting on the stocks for want of it."

Mr. Carnegie proceeded then to say:

That telegram settled it, for whenever the public calls on me for anything I can do, unless I fall dead, it is my glory to respond.

That is what I did, because the President asked me to do it, and if the President thinks it is my duty to do anything or to go anywhere for my country, I consider it the voice of God.

Mr. Carnegie went into the armor business as a result of listening to the "voice of God," but there is a sufficiently large amount of documentary evidence to indicate that once in the armor business, with Uncle Sam as a customer, his hearing must have become defective.

VOICE OF GOD OR VOICE OF GREED?

On the 22d of May, 1894, the House passed a resolution authorizing the Committee on Naval Affairs to investigate the charges of fraud filed against the Carnegie Steel Co., then Carnegie, Phipps & Co. The investigation was made by a subcommitee consisting of Messrs. Cummings, Money, Talbot of Maryland, Dolliver, and Wadsworth. The evidence was large and convincing. Here is some of the evidence bearing directly upon the question of fraud in the manufacture of armor plate by this apostle of peace, to whom the voice of the President is the same as the voice of God.

Charles M. Schwab was then superintendent of the company, but is now president of the Bethlehem Steel Co., and one of the 43 Carnegie-made millionaires. He testified that the armor plate did not "receive uniform treatment"; that they did not make any armor plate that did not "have blowholes"; that the "blowholes" were secretly "plugged" and kept "concealed" from the Government inspectors; that he knew of this fraudulent work. The document which contains all this evidence is House of Representatives Report No. 1468, Fifty-third Congress, second session.

The superintendent of the works, W. A. Cline, testified that he almost invariably changed the figures so that false reports of the treatment of the plates were systematically made to the Government inspectors; that he discharged some of the workmen because they told the truth about this fraudulent work.

William E. Cory, a superintendent, testified that the tensile strength of each plate was stretched so as to increase their apparent tensile strength without the knowledge of the inspectors of the Government; that he knew false specimens were substituted for the plates selected by the Government inspectors, but he considered it "a matter of small importance"; that plates selected by the Government inspectors for physical and ballistic tests were re-treated before the tests were made and without the knowledge of the Government inspectors. This fraud led the inspectors to believe all the armor was as good as the specially treated plates secretly made after they had been selected for making tests.

Mr. T. F. Van Kirk, a workman in this company's works, testified that on April 11 and 12, 1892, a plate, x-9, 13 inches, was—

plugged and hammered up. Forty holes in top and bottom of plate. This plate was afterwards finished, stamped x-8, 13 inches, April 23 and 24, 1892. Holes in top of plate run in wire 4 feet or more. The material in this plate was very bad, and in trying to plug the plugs would fall in, but we finally doctored it up and it passed inspection.

In an affidavit Samuel Sheriff says:

The plugging and doctoring of plates was generally done at night, when no inspectors were about, but I seen one fixed one day at noon.

Mr. T. F. Farley, another workman, testified in an affidavit that—

the plates were frequently imperfect, were full of deep holes and defects; frequently taken off the planer in the daytime and hidden or covered up until night so as not to be seen by the inspectors, and then worked upon in the nighttime. I have seen these defective plates passed, inspected, and shipped from the works to their destination.

Mr. G. W. Kountz says in his affidavit:

I have known of heavy plates being plugged of holes from 4 to 6 inches, unknown to the Government inspectors. This fraud has been practiced upon the Government since long before November, 1892, and since September, 1893.

Mr. T. F. Farley says in his testimony:

When I first went there they were plugged by taking cuttings from the same plates, * * * hammering them in with a punch, and placing more and more in the hole until it was level, until it could stand no more plugging. I have run wires in to the depth of 18 inches into these plates, and I know that plates that I run a wire in 18 inches passed and is now somewhere.

WAR TRAFFICKERS CAN DEFRAUD UNCLE SAM AND KEEP OUT OF THE PENITENTIARY, BUT ORDINARY CITIZENS BETTER NOT TRY IT.

Mr. Carnegie's company was found guilty of fraud upon the Government, and damages of $600,000 were assessed against his company, but he managed to compromise for $140,000. The fact that the Carnegie Company defrauded the Government did not seem to impair in the least its standing with the Navy Department. Mr. Carnegie was given larger contracts than ever.

While Mr. Carnegie was on the witness stand before the Stanley Steel Trust investigating committee, Congressman BEALL of Texas inquired whether it was his habit to consult his attorney to learn the law, so as to be able to operate his business accordingly. Mr. Carnegie, pointing to his head with his index finger, replied:

I never bothered my head about the law.

Perhaps this explains it.

Mr. Carnegie, testifying before the Federal Commission on Industrial Relations on February 5, 1915, read a carefully estimated summary of his benefactions, amounting to $324,657,399. That is, in addition to creating his 42 or 43 millionaires, he has actually given away $324,657,399, and his fortune is still large enough to permit him to give away as much again. It would be interesting to know how many of these millions were collected from Uncle Sam in the form of excessive prices for armor and munitions, after Uncle Sam had collected them from the men, women, and children of the United States through a tax on their food, clothing, and other necessaries of life.

It is noticeable that in philosophizing on the art of money-making Mr. Carnegie reserves to himself exclusively the right to acquire millions by the methods he has acquired them.

In his address to the working girls of New York on February 10, 1911, reported in the Washington Post February 11, 1911, he said:

I have made 42 or 43 millionaires in my time, but I want to say that the only right a man has to wealth lies in his acquiring it by his own labor.

FRAUDS CONTINUE TO PRESENT TIME, IS BELIEF.

Representative HENRY T. RAINEY, of Illinois, one of the best-known and most courageous Members of the House, has devoted considerable time to the subject of defective gun forgings palmed off on the Government by the ammunition ring. He expresses the conviction that these frauds are being perpetrated upon the Government even to this day. I quote from his speech delivered in the Sixty-first Congress:

The fact of the continuance of these frauds is evidenced by the frequency with which guns explode on our battleships and on land, killing and maiming men; by the frequency with which boilers on our ships blow up, with such awful results to human life.

Guns while being tested by other great nations of the world do not explode with disastrous results. We do not read in the papers that boilers frequently explode on the war vessels of England or Germany or any other nation. The very large number of these accidents in our own Navy and in tests made by our Navy officers leads to the irresistible conclusion that there are defects in the castings of the guns and in the castings for the steel tubes and boilers furnished by our steel companies. I desire to insert here in my speech a few of the more important accidents of this character as recorded in the news items of our metropolitan papers.

DISASTERS CAUSED BY EXPLOSIONS, BURSTING GUNS, FAULTY BREECH BLOCKS, ETC.

1902, February 2. Battleship *Kearsarge*, West Indian waters; gun burst, killing 5.

1903, January 17. Battleship *Massachusetts;* gun explosion off Culebra Islands; 6 killed.

1903, April 9. Battleship *Iowa;* explosion of gun; 3 killed, 5 wounded.

1904, April 13. Battleship *Missouri*, off Pensacola Fla.; explosion; 32 killed.

1904, December 14. Battleship *Massachusetts*, at Philadelphia; explosion in firerooms; 3 killed, 4 scalded.

1905, July 21. Gunboat *Bennington*, San Diego, Cal.; boiler explosion; 34 killed, 66 injured.

1906, January 10. Battleship *Massachusetts;* gun explosion; 9 killed.

1906, April 13. Battleship *Kearsarge*, in Caribbean Sea; explosion; 6 killed.

1907, July 15. Battleship *Georgia*, Massachusetts Bay; explosion; 6 killed, 15 injured.

1908, June 5. In California waters, cruiser *Tennessee;* bursting of boiler tube; 6 killed.

——— ———. Torpedo-boat destroyer *Hopkins*, California waters; exploding boiler; 1 killed, 5 wounded.

1910, March 28. Cruiser *Charleston*, in Philippine waters; gun explosion, alleged faulty breech block; 8 killed, 7 or 8 wounded.

1910, July 21. Explosion of gun, Fort Monroe; 12 killed.

1910, September 9. Battleship *North Dakota;* explosion, Hampton Roads; 3 killed.

1910, November 19. Explosion of gun, Indianhead; 4 killed.

1911, January 13. Cruiser *Washington;* cylinder head blown out. Also about this time 3 similar accidents to vessels in Admiral Schroeder's fleet; no one killed.

1911, January 17. Battleship *Delaware;* boilers exploded; 9 killed; just outside Hampton Roads.

Total killed in nine years, 147.

Total maimed in nine years, 102.

As a result of the accidents I have enumerated, and there have been others, in nine years 147 men have been killed and 102 maimed for life. In other words, by these accidents, in nine years of profound peace, we have killed or maimed for life more of our men than were killed in action in the Spanish-American War.

In order to show that the frauds continue to this day, I have original affidavits, made within the last few months up here at Bethlehem.

WORKMEN TESTIFY HOW GOVERNMENT IS CHEATED.

I will insert affidavits of workmen at the Bethlehem plant:

SOUTH BETHLEHEM, PA., *April 29, 1910.*

This is to certify that I know there was work done in No. 2 machine shop for the United States Government that was not up to specifications. I myself have deceived the inspector many a time.

On the last lot of 5-inch mounts that were made here a number of patches were placed on the brackets to cover up a mistake in machining. These were put on in such a way so that under ordinary inspection they could not be detected.

I know of a slide for a 12-inch gun that was being machined when a blowhole was discovered. The yoke was taken off the machine and at night the hole was filled up with metal and the yoke put back on the machine, the inspector not discovering the trick. I know of a track for a 12-inch turret which, while being machined, was found to be cracked. I closed the crack by hammering the crack shut and finished machining it.

FRANCIS J. GILLESPIE.

COUNTY OF NORTHAMPTON, *State of Pennsylvania, ss:*

Francis J. Gillespie, the subscriber, being duly sworn according to law, deposes and says that the foregoing statement is true and correct as he verily believes.

Sworn and subscribed to before me this 29th day of April, 1910.

[SEAL.] JOSEPH H. MCGEE,
Justice of the Peace.

My commission expires first Monday in May, 1912.

—

SOUTH BETHLEHEM, *April 29, 1910.*

In a brief submitted to President Taft on April 6 by the committee of striking employees of the Bethlehem Steel Co. we charged that during the night, when Government inspectors were not present, workmen were compelled to treat, patch, and weld inferior work so that work could be forced to be accepted by the Government.

In a letter from Mr. G. v. L. Meyer, Secretary of the Navy, to the President, under date of April 21, 1910, of which I have a copy, he states that our charge has been investigated. In his letter he states that "it appears that no evidence in support of this can be obtained, and the inspectors claim that should defective work be treated in this manner it would subsequently be detected on inspection and test, and reports indicate that the Government is fully safeguarded by the daily routine inspection."

He also states: "In general, it is believed that the character of the work accepted upon inspection by the Government fully meets the requirements of the Government, and through the system of inspection now in vogue the interests of the Government are well protected."

Regardless of this report, work was treated at night, and men were not allowed to tell the inspector, and after the work was treated if there was any chance of the inspector being deceived into accepting the work as being up to specifications it was submitted to him. I know that on an order of 5-inch sights for the Navy, about three years ago, that some of these sights were found out of alignment during the company shop test, and that the steel castings were hammered with a sledge to bend them so they would line up. The recoil of the guns, when these sights were used, must have sprung these castings back to their old shape, and thereby made it impossible for our sailors to shoot straight. I offer as witnesses Horace Klinesmith and Robert Johnson, former employees of No. 4 machine shop.

During the building of the 12-inch ammunition hoists for the battleships *North Dakota* and *Delaware* a number of buffers, to be used as cushions to take the weight off the lower cars, were found to be not strong enough. The inspector (J. C. Farrall) refused to accept them on the ground that the springs were not firm enough. The foreman (Harry Lynn) promised to put new springs in. The real trouble was that the bore was out of round in the bottom of the castings, and when inspector was home to dinner these buffers were taken apart and filled with thick vaseline, which stopped up the leak and made it appear as though new springs had been put in, and were accepted by the inspector.

I was working as assistant to the inspector, and know this to be a fact. On the same job there were several levers welded by electricity to fill up dirt holes, and were in bad shape, and I put the inspector next to it, and was asked by Foreman George Meyer, of the second floor: "Who the hell told him that?" These levers were thrown out by Inspector Farrall. At the present time there are under construction twenty-four 6-inch howitzer gun carriages and twenty-four 6-inch howitzer limbers upon which much inferior work was done, and up to the time of strike was hid from the inspector. Parts have been broken in flanging and welded with acetylene gas; axles have been machined wrong and patched; other parts machined wrong and doctored up to make it pass inspection. In fact, the idea in the shop is to make the work "appear" as though it is up to specifications, or, in other words, get it past the inspector by fair or foul means. I offer as witnesses Horace Klinesmith, George Stegmair, George Miller, Robert Johnson, Ralph Otto, John Wendling, Henry Doyle, and William Everett. Also,

on shells for the Navy, if the center has been drilled too deep, leaving a hole in the nose of the shell instead of a point, the hole is drilled deeper and a pointed plug put in. As this was done when inspector was home, I am sure it was not allowed by inspector. This shell job was kept very secret in shop, and should be thoroughly investigated, as there was a large bonus paid for getting these shells out in a certain time, which acted as an incentive for the men to deceive the inspector. In fact, in No. 4 machine shop the practice of treating inferior workmanship was so common that nothing was thought of it. An investigation where men could be placed on oath would bring to light a great many things which I haven't mentioned. I do not blame the inspectors for this, as it would be impossible for an inspector to detect some of these operations. When it is known that Mr. Everett, a skilled jeweler, is used on some of this work the impossibility of detecting these things by ordinary inspection is apparent.

DAVID WILLIAMS.

COUNTY OF NORTHAMPTON, *State of Pennsylvania, ss:*

Personally appeared before me, a justice of the peace in and for the aforesaid county, David Williams, who, being duly sworn, deposes and says that the foregoing statements are true and correct, as he verily believes.

Sworn to before me this 29th day of April, A. D. 1910.

[SEAL.] JOSEPH H. McGEE,
Justice of the Peace.

My commission expires first Monday in May, 1912.

ARMOR RING, INSTEAD OF TAXPAYERS, ARE PROTECTED.

The naval bill now pending before the Congress, which was reported from the House Naval Affairs Committee on January 16, 1915, and was passed by the House February 5, and is now waiting to go before the Senate, is loaded to the guards with fat, juicy pork for the armor ring.

When the bill was reported from committee it was bad enough, so far as protection for the taxpayer in the purchase of armor and armament is concerned, but when it left the House whatever safeguards for the public it had contained had been eliminated on points of order.

When the bill was reported it contained this provision:

That no part of any sum herein appropriated shall be expended for the purchase of structural steel, ship plates, armor, armament, or machinery from any persons, firms, or corporations who have combined or conspired to monopolize the interstate or foreign commerce or trade of the United States, or the commerce or trade between the States and any Territory or the District of Columbia, in any of the articles aforesaid, and no purchase of structural steel, ship plates, or machinery shall be made at a price in excess of a reasonable profit above the actual cost of manufacture. But this limitation shall in no case apply to any existing contract.

Let us analyze this paragraph to see what it really means: It provides that "no purchase of structural steel, ship plates, or machinery shall be made at a price in excess of a reasonable profit above the actual cost of manufacture." This means that no purchase of structural steel shall be made in excess of a reasonable profit above the actual cost of manufacture; that no purchase of ship plates shall be made in excess of a reasonable profit above the actual cost of manufacture; and that no purchase of machinery shall be made at a price in excess of a reasonable profit above the actual cost of manufacture.

What about armor and armament? It does not say that purchases of armor and armament shall not be made at a price in excess of a reasonable profit above the actual cost of manufacture.

There is some competition in structural steel, ship plates and machinery, but in armor and armament, to all practical ends, there is none. Therefore the manufacturers of structural steel, ship plates, and machinery must not charge more than a reasonable price, but the armor and armament rings can charge any old price that may suit their fancy.

I arose for the purpose of offering an amendment to have the words "armor, armament" inserted after the words "structural steel," but before I could obtain recognition from the Chair a point of order was made against the entire paragraph. It was accepted by the chairman of the Naval Affairs Committee quicker than you could say Jack Robinson, and out went the entire paragraph—structural steel, ship plates, and all. Selah!

Will not the Senate, in the interests of a long overgouged public, see that this paragraph promptly goes back, and also that armor and armament is not slighted by failure to mention? Armor and armament is not small fry. The bill provides for the purchase of $18,000,000 worth of it.

WHY NOT PERMIT THE PUBLIC TO KNOW THE IDENTITY OF THE PATRIOTS BEHIND THE WAR TRUST?

After the paragraph providing for the purchase of the armor plate I offered the following amendment:

Provided, That the Secretary of the Navy shall not consider any bid for the supplying of the armor or armament herein provided for unless such bid is accompanied by a sworn list of stockholders and bondholders of the corporation submitting such bid, such list of stockholders and bondholders to be taken from the books of said corporation as of date of July 1, 1914: *And it is further provided*, That such list of stockholders and bondholders shall be transmitted to Congress in a separate report by the Secretary of the Navy.

This amendment went to its grave on a point of order made by the chairman of the Naval Affairs Committee.

My purpose in offering the amendment was to ascertain the names of the shareholders of the war trust, the names of the men who profit from the manufacture of war munitions by private construction. Those who are advocating the taking of profit out of war and preparation for war by having all Army and Navy equipment manufactured in Government plants can make a more intelligent fight if they know exactly who they are fighting. Until the identity of the stockholders of the war trust can be established it might, perhaps, even though unpleasant, be logical to assume that those patriots who cry out in anguish every time the Government manufacture of war munitions is mentioned have been struck in the region of the pocketbook, an exceedingly tender part of the anatomy.

Comparisons are odious, but in 1909 the Investors' Review of London examined the stockholders' lists of several British war-trafficking concerns and it found in the list of one company alone (Armstrong, Whitworth) the names of:

Sixty noblemen, their wives, sons, or daughters.
Fifteen baronets.
Twenty knights.
Eight members of Parliament.
Twenty military and navy officers.
Eight journalists.

Later lists revealed a marked connection between stock holding in armor and munition companies and active membership of "purely patriotic" organizations, such as the British Navy League.

In this country it is impossible to obtain lists of the stockholders in the war-trading concerns. The Stanley steel investigating committee was unable to obtain them, and when I applied to our Federal Bureau of Corporations I found it did not possess them, and that there was some question as to whether the bureau had the authority to attempt to obtain them.

SECRETARY OF NAVY FAVORS GOVERNMENT MANUFACTURE.

When Mr. Daniels, for many years editor and publisher of the Raleigh (N. C.) News and Observer, was sworn in as Secretary of the Navy and had time to look about him, he found that the people's money was being wasted by the payment of excessive prices for armor and practically all articles required for the Navy. Throughout his two years in the Cabinet he has been earnestly endeavoring to rescue the Public Treasury from the patriots for war, who year in and year out have been helping themselves, seemingly at will, from the public crib. Secretary Daniels has saved the Government some $2,000,000, which is but a drop in the bucket to the amount he could save if he could obtain Government manufacture of everything.

In his first annual report for the year 1913 Secretary Daniels asked for an appropriation for an armor-plate factory. I quote from that report:

IMPORTANCE OF ARMOR-PLATE FACTORY.

I desire to recommend the passage at the earliest moment of a sufficient appropriation to begin the construction of a Government armor plant to relieve a situation which, in my estimation, is intolerable and at total variance with the principle of economy in spending Government money. It is not my intention to enlarge here upon the economic reasons that prompt me to make this recommendation, as I have already gone into them at length in a letter to the Senate in response to a request for information. It is sufficient to mention here that only three firms in this country can manufacture armor plate, and that these firms have put in bids for armor plate seldom varying over a few dollars, and in many instances being identical to a cent. Asked for reasons as to the uniformity of these bids, two of the firms replied frankly that as the contract would be divided amongst them anyway, the only effect of competitive bids would be to reduce the profits made by all of the three firms.

* * * * * * *

By manufacturing armor plate in its own plant the Government will be able to keep for its own use any improvements in the manufacture or composition of its armor that may be developed. The last word has not been said in armor, and past history shows that great improvements in the manufacture and design of armor plate have been made. The greater part of these improvements were suggested by actual experience gained by naval officers. Under our present system of obtaining our armor plate from private companies such improvements become the property of all the world and can be obtained by anybody who cares to buy them. Even now the improvements in armor and the designs worked out by the Navy have been embodied in the warship of another nation recently finished by the Bethlehem Steel Co. and put into commission. This is not an argument lightly to be disregarded in favor of a Government armor plant, nor has it been overlooked, for instance, by Japan, which has erected its own armor-making plant and surrounded it with such secrecy that none of the other nations are able to tell whether or not at this minute the Japanese armor may not be superior to any other in existence. In addition to Japan, the French Government, after experimenting with a factory capable of producing only the lighter weights of armor, is enlarging its Government plant so as to permit of the production of thick plates, and Russia has had its own armor-plate factory for some time.

* * * * * * *

I do not see how it is possible for Congress to justify to the people a refusal to erect a Government plant, nor how it can answer the charge that will invariably be brought up—that the same mysterious Providence which saved this profitable business to the steel companies three times in the past, even after money for a Government plant had actually been appropriated, is not still at work exercising its beneficent protection over these lusty specimens of infant industries, who are even now under Government investigation as violators of the antitrust law.

In his annual report for the fiscal year ending 1914, Secretary Daniels has reviewed his efforts to secure a Government-owned armor-plate factory, and says he is convinced that enormous sums could be saved to the taxpayers by the erection of a Government plant.

It became even plainer than last year—

He says—

that the Government is at the mercy of the three manufacturers of armor plate, whose policy is to make the Government pay prices much beyond a fair profit. The three companies make affidavits that they are in no combination and have no agreement affecting prices, as they are required by law to do. This does not, however, prevent their availing themselves of a mental telepathy which works against the Government and denies real competition in the bidding.

Secretary Daniels estimates that the Government would save between a million and three million dollars annually, depending on the size of the plant, if it should manufacture its own armor plate.

Taking the highest estimate which has been submitted to me by the experts of the Bureau of Ordnance—

He says—

as the probable total cost price of Government-made armor, the Government can achieve a saving by the erection of a 10,000-ton-a-year plant of $1,061,360 per annum, after deducting 4 per cent as interest on the money used in erection and installation of plant, and $3,048,462 a year on the basis of a Government plant capable of producing 20,000 tons a year. * * *.

Proof on pages 40 and 41, Annual Report Secretary of the Navy, 1913.

What is true of armor plate is practically true of all kinds of war munitions, both for the Army and Navy. In his last annual report, submitted two or three weeks ago, the Secretary of the Navy makes the flat assertion (p. 9):

Contrary to popular idea, the Navy Department in what it manufactures does so, from a superdreadnaught to a gallon of paint or a pound of powder, cheaper than the same can be purchased. This is particularly true of the most expensive instruments of war, but is equally true of gasoline engines, electrical supplies, engines for dreadnaughts, shrapnel, clothing for marines and sailors, accouterments, and a multitude of other articles required for the fleet and shore stations.

The Secretary's report shows that as a result of the enlargement of the Government powder factory large savings have been made (p. 10, Annual Report Secretary of the Navy, 1914):

SECRETARY SAYS GOVERNMENT MANUFACTURE REDUCES PRICES.

Before the Government began to manufacture smokeless powder—

Says the Secretary—

it paid 80 cents a pound for it. Government competition, coupled with better methods, have brought down the price at which the department purchases this powder to 53 cents. The department is now manufacturing it at Indianhead at a cost of 36 cents a pound, and when the enlarged plant is completed may be able to still further reduce the cost of production. If the department had bought what it manufactured last year, the powder bill would have been $397,536.16 more than it was. In addition to effecting this saving by manufacture, the department reworked 1,013,940 pounds, at 11.9 cents per pound, and this method insures the use of much powder every year that would otherwise be useless.

Another specific instance of the elimination of private profits, or partial elimination, by Government operation is in the case of the manufacture of torpedoes.

In the two years that the present torpedo works have been in full operation at Newport, R. I.—

Says the Secretary, on page 10 of his last annual report—

the cost of manufacture of each torpedo has been reduced from $4,200 to $3,200. These torpedoes, if bought at the only private torpedo plant in the country, would cost $5,000. The enlargement of the torpedo works will not necessarily cause the Navy Department to manufacture all its torpedoes, but ability to make a large proportion of the number needed will result in securing better prices from manufacturers. This is true of all other munitions of war. Ability to make them secures reduction in cost.

The Secretary of the Navy sums up the two reasons why we should have Government manufacture of war munitions:

The department should be able to demand competitive bids by having potential facilities to manufacture anything needed for armament or equipment which may at any time be controlled by those who demand excessive prices. There is another reason why the Navy Department should be able to manufacture munitions of war; that policy would prevent effective agitation or organization for big preparations for war conducted by those who make profit by the manufacture of war supplies. It has been suspected—

Goes on the report—

in some countries that makers of armor and powder, guns, and fighting craft have promoted steadily increasing equipment for giant navies and large armies for their personal enrichment, as others have practiced "philanthropy and 5 per cent." The incentive of personal aggrandizement by preparations for war should not be permitted to exist in the United States. The effective way to prevent so baneful an influence is for Congress to give the department authority to manufacture implements of war, an authority which could be employed when necessary. (Annual Report, 1914, pp. 10–11.)

ARMOR RING REMAINS SNUGLY IN THE SADDLE.

Although the Secretary of the Navy asked Congress for an "appropriation to begin the construction of a Government armor plant," no appropriation was provided for in the naval bill in 1914.

Instead of providing for an appropriation for an armor plant, which would have rescued the taxpayers from the tender mercies of the armor ring, the House Committee on Naval Affairs brought in the following provision, which leaves the Government at the mercy of the ring and does not in any manner change the conditions now existing:

The Secretary of the Navy is hereby authorized and directed to investigate and report at the next regular session of Congress upon the selection of a suitable site for the erection of an armor plant to enable the United States to manufacture its own armor plate and special-treatment steel capable of standing all ballistic and other necessary tests required for use in vessels of the Navy at the lowest possible cost to the Government, taking into consideration all of the elements necessary for the economical and successful operation of such a plant, such as the availability of labor, material, and fuel, and transportation facilities to and from said plant. Said report shall contain the cost of a site sufficient to accommodate a plant having an annual output capacity of 20,000 tons and a site for an output of 10,000 tons, and also an itemized statement of the cost of the necessary buildings, machinery, and accessories for each, and the annual cost and maintenance of each, and the estimated cost of the finished product.

The action of the committee in thus providing only for an investigation, of which there have been several in the past, as I shall show, instead of providing for an armor factory, as recommended by the Secretary of the Navy, is worth from $3,000,000 to $5,000,000 a year to the armor ring.

I would have favored enthusiastically the provision providing for an investigation of the cost of armor but for the fact that numerous investigations have been made in the past, and this provision for an unnecessary additional investigation impressed me, as I stated at the time on the floor of the House, as being merely a dodge to sidetrack an appropriation in this Congress for an armor plant, as recommended by the Secretary of the Navy.

The insertion of this provision instead of a paragraph carrying an appropriation for a plant means that the movement for an armor factory is set back to the point it reached 19 years ago.

What has been the result of the provision providing for another "investigation"? The chairmen of the House and Senate Naval Affairs Committees and Admiral Strauss, of the Navy Department, have been appointed as a committee to "investigate." A few days more and the present Sixty-third Congress will adjourn and go out of existence. The "investigating committee" has made no report and say they will make none in time for action by the present Congress. It is said the armor companies refused them access to their books, and there is every reason to believe the "investigating committee" will not have any more information on the subject than was available before they started on their "probe."

But the precious life of the armor ring has been saved! There has been no appropriation for a plant, and that is the thing the ring was opposed to and the only thing that it fears.

In the meantime there has been an election and 20 or 30 Members of Congress who were in favor of a Government plant have been defeated, and many of them will be succeeded by men who will be unfavorable.

It has been my conviction throughout the Sixty-third Congress that if a vote could be had on the subject an armor plant would have been authorized. It is also my conviction that in the Sixty-fourth Congress there will not be enough votes to obtain an appropriation for a Government plant. The patriots for profit are resourceful. As profit is on their side and only a principle on the other side they will generally be victorious.

Now, let us see whether there have not been ample investigations in the past, without the necessity for an additional one at a time when the votes are on hand to obtain a Government plant.

VERY THOROUGH INVESTIGATION IN 1896–97.

On December 31, 1895, the Senate passed a resolution directing the Committee on Naval Affairs to "inquire whether the prices paid or agreed to be paid for armor for vessels of the Navy have been fair and reasonable," and "whether any legislation is necessary to further promote the manufacture and cheapen the price of armor." The committee also had before them the bill (S. 1700) to provide for the erection of an armor-plate factory in the city of Washington, D. C.

This committee, with the assistance and cooperation of the then Secretary of the Navy, H. A. Herbert, made a most thorough and scientific investigation of the whole subject.

The report and hearings of this investigation of the cost of armor makes a volume of 464 pages.

The conclusions of the committee, briefly, were as follows:

That a Government armor factory could be erected for the sum of $1,500,000, and that it is expedient to establish such a factory in case the armor manufacturers decline to accept such prices for armor as may be fixed by law.

The committee was of the opinion that a fair average price for armor was between $300 and $400.

The committee arrived at this conclusion as follows:

Cost of labor and material per ton	$168
Add for reforging	12
	180
Add for maintenance of plant	30
	210
Thirty-three and one-third per cent profit	70
	280
Add for nickel	20
Making the price for armor	300

The committee prepared this table after Secretary of the Navy Herbert had submitted one in which he had estimated that $400 was the outside price which the Government ought to pay for armor.

Secretary Herbert's estimate was as follows:

The Secretary takes as the cost of labor and material in double-forged, harveyized, nickel-steel armor the sum of	$196
He assumes that the plant costing $1,500,000 would need $150,000 per year for maintaining it, or $50 per ton upon 3,000 tons of armor, and adds to the price	50
Making	246
Or, in round numbers	250
He then adds for profit 50 per cent	125
Making	375
And then adds for nickel to be furnished hereafter by the contractors	20
Making	395
Or, in round numbers	400

In arriving at the figures used in the table both the committee and Secretary Herbert had accepted the figures submitted by the armor manufacturers themselves as to the cost of their plants, and so forth, although the armor concerns refused to permit the Government to have access to their books to substantiate their figures.

Read now, 18 years after the testimony was taken, the hearings contain some rich humor.

Practically, taking the manufacturers' own figures as to the cost per ton of manufacturing armor, the Secretary allowed 50 per cent and the committee 33 per cent as profit. Independent of the 50 per cent for profit, the Secretary allowed 10 per cent of the value of the plant for maintenance.

I estimated—

said Secretary Herbert while testifying before the committee—

from information which I have obtained in Europe and elsewhere that either the Carnegie or Bethlehem plant could now be reproduced for about $1,500,000, but in order to be on the safe side I have allowed them maintenance upon $2,000,000 ($500,000 margin), and 10 per cent instead of 5 per cent. Then, allowing them maintenance at that rate, I have allowed them also a profit of 50 per cent, and for that sum it does seem to me they ought to be able to manufacture the armor the Government needs.

In addition to all this, Charles M. Schwab, then general manager of the Carnegie Steel Co., appeared before the committee and demanded an additional 10 per cent, producing, when read to-day, some of the richest humor contained in the entire hearing.

He argued that in addition to the liberal allowance for maintenance, depreciation, interest on original investment, interest on working capital, and all conceivable as well as inconceivable overhead charges, his company should be allowed another 10 per cent for "loss by abandonment of plant when Navy shall have been completed." He argued that the Navy would probably be "completed" at the end of 10 years, and then the plant would be entirely valueless, ready to be consigned to the scrap heap. He thought the Government ought to be willing to pay for the plant, in addition to the profit on manufacture. The committee was at first inclined to think this logic was satisfactory.

But at this point Secretary Herbert recovered his equilibrium, according to the hearings, and blocked further gratuities to the Carnegie Co.

The Government has, according to my estimates—

testified the Secretary—

paid for the plant, and they have the plant now, if these calculations are correct, and there is a large balance over.

Seventeen years have passed since the time it was anticipated that the Navy would be "completed" in 10 years; and where we were using only 6,000 tons of armor a year then, we are using 16,000 tons now. Up to that time we had used a total of only 18,952 tons of armor, while up to the present day we have used a total of 85,193 tons. At the time of this investigation we had expended, in all, only $11,776,670 for armor, while up to the present time we have spent a total of $95,656,240, and the bill now under consideration carries an additional sum of $18,588,988 for armor and armament, and the Navy is not yet "completed."

The first thing the investigation developed was that various naval officers, both active and retired, were in the employ of the armor concerns. The then Chief of Ordnance of the Navy himself, Commander William M. Folger, was shown to have been in the employment of several concerns doing business with the Government. This official finally resigned from the Navy to enter the employment of the Harvey Steel Co., receiving therefor salary at the rate of $5,000 per year and $20,000 worth of stock in the Harvey Steel Co.

It developed at the hearings that whenever a naval officer found an opportunity to go into the employment of a private manufacturer it was the custom of the department to grant him a leave of absence for two or three years at what was known as "waiting-orders pay," which amounted to $2,300 per annum, and which was two-thirds of full pay. While receiving $2,300 from the Government the officer would be receiving a considerably larger sum from private manufacturers having dealings with the Government. It developed that one officer who resigned from Government service and went into the employment of the Carnegie Steel Co.—Lieut. Stone—for a while had a desk in the office of the Bureau of Ordnance at the Navy Department, acting as the agent of the Carnegie Co. even after he had severed his official connection with the Government.

In its report the committee strongly condemned this sort of thing, and declared that another widespread evil just as bad was the custom of the department in permitting naval officers to become financially interested in patent processes used by the Government. In its report the committee said:

The committee had no hesitancy in reaching the conclusion that the above custom was a bad one and should be discontinued under all ordinary conditions; and especially that the employment of naval officers by contractors having large dealings with the Government should be peremptorily prohibited by law.

SECRETARY HERBERT'S REPORT JUSTIFIES APPROPRIATION FOR PLANT.

We now come to the report of Secretary of the Navy Herbert, made January 5, 1897, after many months of careful investigation, during which the Secretary personally visited several European countries. The Secretary also had the assistance of a board of naval officers. From his report the following is quoted:

The Secretary called together a board composed of Lieuts. Karl Rohver, Kossuth Niles, and A. A. Ackerman, two of whom had been inspectors of armor at the Bethlehem Co.'s Iron Works; the other, Lieut. Ackerman, had been connected with the manufacture and use of steel in its different forms for a number of years, during which time he had spent several months at both the Bethlehem and Carnegie works. These gentlemen made an exhaustive report upon the cost of labor and material entering into a ton of armor, showing in detail every little item, beginning with the cost of the several ingredients charged in the furnace for casting the ingot preparatory to the forging process and ending with the work on the finished plate. The result of their calculations was that the cost of the labor and material in a ton of single-forged harveyed nickel steel armor, the Government supplying the nickel (nickel at $20 per ton), was $167.30.

* * * * * * *

Lieut. Commander Rodgers, who had been an inspector at Bethlehem Iron Works, was called upon to make an estimate of the cost of manufacturing armor, and his report, based upon observation in the manufacture of armor, makes the cost of labor and material in a ton of single-forged harveyed nickel steel armor $178.50.

* * * * * * *

The inspector of ordnance at the Carnegie Steel Co., Ensign C. B. McVay, was also called upon for an estimate, and his report, though made separately without consultation with the other officers, is that the labor and material in a ton of single-forged Harvey nickel steel armor is $161.54.

* * * * * * *

Average for single forged of above estimate is $185.38, and $197.78 for reforged armor.

COMPETITION TO ARMOR RING FROWNED UPON BY NAVY DEPARTMENT.

On March 10, 1897, the Navy Department issued a circular calling for bids on 8,000 tons of armor, specifying that no bid in excess of $300 per ton, the limit fixed by Congress in the act of March, 1897, would be accepted. Although they had furnished armor to Russia in 1894 at $249 a ton, the Carnegie and Bethlehem companies refused to bid, because of the fixed limit of $300.

When read now as a chapter in the long history of the dealings between the Armor Trust and the Government, in every chapter of which the Government seems to have gotten the worst of it, this circular incident has all the earmarks of having been something in the nature of a joke.

The Carnegie and Bethlehem companies refused to bid, because they knew they would get the contracts at a higher price than $300 if they simply stood pat and refused to bid. The law was so worded as to assure them the business. The act provided that the armor must be of "domestic" manufacture, and as these two companies had a monopoly on domestic manufac-

ture, and as they knew a new plant could not be put up within a year or two, and the Government must have the plate before that time, it was obvious that all they had to do to obtain their price was to refuse to bid and wait for developments.

But this circular, harmlessly intended though it appears to have been, came within an ace of smashing the Armor Trust. The Illinois Steel Co. submitted a proposition to supply the 8,000 tons of armor at an average price of $300 per ton, conditioned upon Congress awarding the company a contract for furnishing the Government its armor for 20 years, at an average price of $240 per ton. The proposition was ignored. This is the narrowest escape the Armor Trust has ever had.

Since that time the Government has bought 186,187 tons of armor, paying on an average $440 per ton for it. Had the Government accepted the $240 per ton proposition of the Illinois Steel Co. in 1897 it would by this time have realized a saving of more than $35,000,000, and there is no reason to believe the steel company would have gone into bankruptcy, either.

THE VARIOUS NAVAL BILLS AND THEIR REFERENCE TO ARMOR.

As a result of the revelations disclosed by the investigation of the Senate Naval Affairs Committee in 1896–97, which showed beyond successful contradiction that the armor manufacturers had been outrageously gouging Uncle Sam, the naval bill of 1897 provided that—

no contract for armor plate shall be made at an average rate to exceed $300 per ton of 2,240 pounds.

The naval bill of 1898 provided that—

no contract for armor plate shall be made at an average rate to exceed $400 per ton of 2,240 pounds.

The naval bill of 1899 provided that—

no contracts for the armor for any vessels authorized by this act shall be made at an average rate exceeding $300 per ton of 2,240 pounds, including royalties.

Then came the act of 1900 containing the provision authorizing the Secretary of the Navy to build an armor factory in the event he should be unable to obtain a reasonable bid from the armor companies. This provision is practically the same as the one I offered as an amendment to the pending bill, which was ruled out on a point of order. I shall, however, to keep the record clear, quote the provision just as it was enacted into law in the naval bill of 1900:

Provided, That the Secretary of the Navy is hereby authorized to procure by contract armor of the best quality for any or all vessels above referred to, provided such contracts can be made at a price which in his judgment is reasonable and equitable; but in case he is unable to make contracts for armor under the above conditions, he is hereby authorized and directed to procure a site for and to erect thereon a factory for the manufacture of armor, and the sum of $4,000,000 is hereby appropriated toward the erection of said factory.

BUT THE ARMOR FACTORY HAS NEVER BEEN BUILT.

The armor factory was not built, and I can find no one now connected with the Government who is familiar with the reasons why it was not built.

The naval bills of 1901, 1902, 1903, and 1904 not only were silent on the subject of an armor plant, but in the acts of these years all limitation was removed from the price the Secretary might pay for armor. The acts were so worded as to throw everything to the Bethlehem, Carnegie, and Midvale Cos., because, although the Secretary was not limited as to the price he might pay, he was limited to "domestic" manufactured armor, and the three firms, comprising the armor ring, enjoyed a complete monopoly of the manufacture of armor in this country. Each year, following the investigation, the paragraph carrying the appropriation for armor contained fewer words, but each succeeding year it carried more millions for armor, and was worded as the "ring" would have preferred to have it written had its interests been consulted in the matter. For instance, the paragaph relating to armor in the naval bill of 1904 was very brief, as follows:

Armor and armament: Toward the armament and armor of domestic manufacture for the vessels authorized, $12,000,000.

It was brief, but it did the business for the ring. "Domestic" manufacture, no armor plant, no limitations as to price, smooth sailing.

But by 1905 the demand for an armor plant to rescue the Government from the tender mercies of the Armor Trust again became hot. Some kind of action seemed necessary, so the committee increased the appropriation for armor by $6,000,000, and declared for another investigation, as follows:

Armor and armament: Toward the armament and armor of domestic manufacture for vessels authorized, $18,000,000: *And provided further*, That the Secretary of the Navy shall cause a thorough inquiry to be made as to the cost of armor plate and of armor plant, the report of which shall be made to Congress.

ATTEMPT IS MADE TO SIDETRACK THIS INVESTIGATION.

Although the naval bill directing the Secretary of the Navy to make "a thorough inquiry" as to the "cost of armor plate and armor plant" was approved and became a law on March 3, 1905, the matter was pigeonholed at the Navy Department by officials in charge, who evidently felt friendly inclined to the armor ring and did not desire an investigation.

For more than a year nothing was done. Forced by congressional activity, the first step toward an investigation was taken on May 11, 1906, when Acting Secretary of the Navy Newberry issued an order appointing a board of experts, composed of Kossuth Niles, captain, United States Navy, Walter McLean, commander, United States Navy, and Edward Simpson, lieutenant commander, United States Navy, to proceed with the investigation. The action of the Navy Department in attempting to sidetrack the investigation duly ordered by law amounted to a public scandal. The House of Representatives, on June 5, 1906, passed a resolution directing the Secretary of the Navy to report as to what action had been taken in response to the specific direction of Congress of more than a year previous.

The matter was never satisfactorily explained. Secretary of the Navy Charles J. Bonaparte, in making his official report, simply stated that the matter had been originally placed in the hands of the preceding Secretary of the Navy, Paul Morton, and that "for reasons of which the department is not informed, no further steps were taken in the premises," and that "the subject seems then to have escaped attention."

This incident was distinctly armoresque. With only one or two exceptions, the Secretaries of the Navy have been very friendly to the armor concerns. One Secretary of the Navy—B. F. Tracy, 1889–1893—made contracts with the Carnegie Co. and the Harvey Steel Co. worth large sums to them, and was criticized for not having properly protected the interests of the Government in his transactions with these two armor concerns. After his term as Secretary of the Navy expired, he became counsel for both companies; but a close scrutiny of his dealings with the Harvey and Carnegie companies while he was Secretary of the Navy develops grave doubts as to whether his legal services to the Carnegie and Harvey companies could have been one-half as valuable to these concerns as his official acts as Secretary of the Navy had been.

INVESTIGATION OF 1906 WAS VERY THOROUGH.

With the 43-page report of the investigation of 1906 in existence, there is no excuse for another investigation, as provided for in the pending naval bill, except for the purpose to delay or prevent the construction of a Government armor plant. Although the investigators of 1906 took pains in making their report to eulogize the armor companies, and although their policy throughout their calculations as to the cost of an armor plant and the cost of armor plate seems to have been to resolve all doubts in favor of the ring, yet they appear to have covered every conceivable step in the manufacture of armor, and have worked out their estimates in the most minute detail. It is doubtful if the Government could obtain much additional information, so far as the various elements of cost in the manufacture of a ton of armor plate are concerned, if it was to authorize a dozen investigations.

COST OF ARMOR PLANT.

As to the cost of an armor plant, the report, on page 31, states:

Of the estimates submitted by the inspectors of ordnance, one gives without detail $3,500,000 as a conservative cost of an armor plant of about 10,000 tons yearly capacity.

A second estimate, given in considerable detail, places the cost of a similar plant at $3,875,000.

The report of the armor factory board estimates the cost of its proposed plant—6,000 tons capacity—at $3,747,912. * * * This board believes that the total cost of an armor plant, as estimated upon by the armor factory board, should, to-day, be, in round numbers, $3,750,000.

ESTIMATES AS TO COST OF ARMOR PLATE.

After resolving all doubts and uncertainties on the side of the manufacturers, the investigating board of 1906 reported that the production cost of class A armor is $244.27 per ton, and of class B armor $221.76 per ton. This figure is about $3 per ton less than the average estimates of the four naval investigators of 1896. The fact that two boards, the one of 1896 and the one of 1906, came to almost the same conclusions after having spent months investigating the matter, would appear to add weight to the findings of each. Each investigation in a general way proved the estimates of the other.

In addition to reporting on the "production cost" per ton of armor, both boards also reported estimates as to "full cost." The "production cost" is equivalent to what may be accepted as the cost in a Government plant, while the "full cost" is the production cost with such items as taxes, insurance, and profits added, which a private manufacturer would be required to figure on, but nearly all of which would not properly be chargeable to any estimate as to the cost of manufacture in a Government plant. The Government would not have to pay

interest, taxes, or insurance or figure on profits. In determining the "full cost" allowance was made for such items as office supplies, telephone service, telegraph and postage charges, travel, general expenses, a contingent fund, legal services, experimental work and investigations, an accident fund, hospital fund, and even "the periodic replacement of existing equipment" and the "possible total abandonment of a private works in so special a line as armor-plate manufacture, due to the cessation of any demand for its product." The board allowed a depreciation charge of $43.75 to every ton of armor. Much of the "full cost," allowance was made for such items as office mate, would be eliminated in a Government plant, because this work could be performed by naval officers, who would receive their salaries from the Government whether their services were utilized in an armor plant or not.

Both the "production-cost" and the "full-cost" estimates are based on a plant of only 6,000-ton capacity. All investigators agree that the larger the capacity of a plant the cheaper the output. A two-battleship-a-year program calls for about 16,000 tons of armor annually. Therefore it is obvious that if the Government should build a 10,000 or 15,000 ton plant the estimates as to the cost per ton would need to be considerably reduced.

ESTIMATES COST AT $314 PER TON.

The highest estimate ever given by a Government official, so far as I have been able to learn by searching the records, is that of Rear Admiral Joseph Strauss, the present Chief of the Bureau of Ordnance, who is only lukewarm for a Government plant. Testifying before the Naval Affairs Committee on January 22, 1914, he said:

An armor-plate factory of 20,000 tons capacity with an output per year up to its full capacity can produce armor at a cost of $279 per ton.
If it worked half capacity, the estimate is $349 a ton; and if the output were 5,000 tons, the estimated cost is $400 a ton.
If we build an armor-plate factory with a capacity of 10,000 tons, and work it to full capacity, the cost is estimated at $314 a ton, and at half capacity—that is, 5,000 tons—$394 a ton.
If we build a 5,000-ton plant and work it to full capacity—that is, 5,000 tons per annum—the cost is esimated at $354.
The cost of building 20,000, 10,000, and 5,000 ton plants are, respectively, $11,288,431, $8,466,000, and $6,300,000.

If these figures are correct, and Admiral Strauss is correct in his assumption that it is more expensive to manufacture armor in a plant of small capacity than in one of a large capacity, and that it is much more expensive still to manufacture only a portion of the capacity of the plant, it can be demonstrated by any schoolboy arithmetician that the armor ring on numerous years has manufactured armor for the Government at such low prices as to lose millions of dollars.

For instance, in 1906 the Bethlehem, Carnegie, and Midvale companies were awarded contracts for 1,824, 1,865, and 3,690 tons of armor, respectively, at $345 per ton. If Admiral Strauss's estimates are correct, this armor cost the manufacturers at least $394 a ton; and when the armor manufacturers sold their product to Russia at $249 a ton they were acting in the capacity of philanthropists, if Admiral Strauss is correct. The answer is that the estimates of this admiral are excessive; either that or the estimates of eight other Government experts who have inquired into the subject are too low.

But although Admiral Strauss's estimates are the highest ever given, the Government could save $161.16 per ton with an armor plant of 20,000 tons capacity, $136 per ton with a plant of 10,000 tons capacity, and $86 per ton with a plant of 5,000 tons capacity, even though his unusually high estimates are correct.

POINTS OF ORDER WORTH MILLIONS TO ARMOR RING.

On April 18, 1914, when the naval bill was up, I introduced an amendment providing for an extension of the plant of the Bureau of Ordnance of the Navy Department, so that the Government might manufacture armor plate. In years preceding amendments had been offered to the naval bill providing for the construction of an armor plant, and they had been ruled out of order on the ground the amendments involved new legislation. My reason for providing in my amendment simply for the extension of a plant already in existence was the hope that a point of order would not lie against it, because of the fact the amendment did not provide for an entirely new thing, but simply for the extension of a plant already in existence. A point of order was raised, however, and the amendment was stricken out.

On May 7, while the same bill was under consideration, I offered a second amendment, to be tacked on at the end of the following paragraph of the bill:

Increase of the Navy; armor and armament: Toward the armor and armament for vessels heretofore and herein authorized, to be available until expended, $14,877,500.

This second amendment read as follows:

Provided, That the Secretary of the Navy is hereby authorized to procure by contract armor of the best quality for any or all vessels heretofore or herein provided for, provided such contracts can be made at a price which, in his judgment, is reasonable and equitable; but in case he is unable to make contracts for armor under the above conditions, he is hereby authorized and directed to procure a site for and to erect thereon a factory for the manufacture of armor and gun forgings; and the sum of $4,000,000 is hereby appropriated toward the erection of said factory and the purchase of a site therefor.

This amendment is practically a duplicate of a provision contained in the naval appropriation bill of 1900; and the mere fact that that bill carried this provision resulted in the Government saving millions of dollars in the cost of armor plate. The Secretary of the Navy was able to say to the three firms having a monopoly of the manufacture of armor in this country that if they were not willing to sell armor to the Government at a fair and reasonable price he was authorized by law to go ahead and manufacture his own armor. Let us see whether the insertion of the amendment I refer to proved of value in the naval bill of 1900.

Back in 1893 the Government was paying an average of $658 a ton for armor. Some time later Senator TILLMAN, of South Carolina, started in to fight the high price and to oppose the armor ring, and he forced the Armor Trust gradually to reduce its price until, in 1900, he got the price down to $413 a ton.

Then the naval appropriation bill of 1900 was amended to carry the provision I have just alluded to, which provided that if the Secretary of the Navy was unable to obtain a square deal from the Armor Trust, he was authorized and directed to build a Government armor plant.

What was the result? The three concerns manufacturing armor, rather than have Uncle Sam build a plant, gradually reduced their prices from $413 in 1900 to $345 in 1906, which meant a saving of millions of dollars to the Government. Such was the result of the insertion in the naval bill of 1900 of the provision that I presented. Without spending a dollar for a plant or doing anything further than simply providing that the Secretary of the Navy was authorized to build a plant if he could not obtain fair treatment from the trust, the Government saved millions.

But when Congress failed to continue the provision in the naval bill it gradually lost its moral effect upon the armor ring, and the price of armor plate to the Government was steadily advanced from $345 a ton in 1906 to $454 a ton at the present time.

If this Congress will replace this amendment in the naval bill, I predict it will save every penny of $1,000,000 a year, even if the Government never further considers the advisability of a Government plant.

The bill now before Congress carries an appropriation of $18,588,988 for armor and armament alone. If the Government had its own armor and gun-forging plant I believe I am well within the bounds of conservatism when I say that 35 per cent of this sum, or, in round numbers, $6,000,000, could be saved to the taxpayers. Is $6,000,000 a year on armor and armament alone worth the saving? I for one believe it is.

But my second amendment, like the first, went the way that all amendments go that threaten the profits of that gigantic trust which has a monopoly on preparation for war in this country, and which draws down annually a very large slice of the $250,000,000 appropriated each year for the maintenance of the Army and Navy in time of peace. It went out on a point of order.

WHICH PLAN IS MOST PATRIOTIC?

The question has been raised as to the patriotism of those who insist upon the Government manufacture of all munitions of war, including battleships. I can not see how it can be contended that it is any more patriotic to advocate two battleships to be built by private contractors, with huge profits to the builders, than it is to advocate two battleships to be constructed by the Government, which policy means that for every dollar expended for battleships we will get a dollar's worth of battleship, and that the men who actually do the work of building the ships will receive higher wages and work under far better conditions than if the contracts are given to the Shipbuilding Trust.

The "big-Navy-to-be-built-by-private-contractors" policy will meet with the approval of the armor ring, the ammunition ring, and the Shipbuilding Trust. It will also be eminently satisfactory to the Navy League of the United States, which organization has from the first been an adjunct of the house of Morgan, and is constantly agitating a larger and larger Navy, but, mind you, not a larger Navy to be built at the lowest possible cost with a Government armor plant and in Government shipyards, but a larger Navy to be built by the armor ring, the ammunition ring, and the Shipbuilding Trust.

"BIG NAVY" AGITATION A BUSINESS PROPOSITION WITH THE NAVY LEAGUE.

Ever since I have been a Member of Congress I have been receiving literature from this "big Navy" lobby, and finally I determined to call the attention of its officers to the fact that

their pleas for a larger Navy are tainted, and will continue to be tainted until they advocate the Government manufacture of all munitions of war. On January 16 of last year I addressed a letter to Mr. A. H. Dadmun, the secretary of the league, in which, among other things, I said:

I beg to acknowledge receipt of your letter of the 13th instant, together with inclosures as to why a powerful Navy is needed.

Assuming that you are in good faith in this agitation and really desire the largest possible Navy for patriotic reasons, I am going to take the liberty of suggesting to you that if you will inaugurate a movement for the Government manufacture of all munitions of war, including all battleships, your campaign will strike a much more responsive chord with both Members of Congress and the people.

In other words, if the Government is to do all of the manufacturing of munitions of war, including battleships, the point can not then be successfully raised that the agitation is for the benefit of the armor ring, the ammunition ring, and the Shipbuilding Trust.

But if you do not advocate the Government manufacture of all munitions of war, including battleships, you can not successfully deny that you are carrying on a propaganda which means millions and millions of dollars of extortionate profits to the above-mentioned interests.

I hardly expect readers to fall out of their chairs in amazement when I report that the Navy League has not accepted my suggestion.

MANY PROMINENT PATRIOTS IDENTIFIED WITH THE NAVY LEAGUE.

I desire now to present some information as to who is behind the Navy League:

Mr. J. Pierpont Morgan was until his death one of the directors, and intensely interested in the league's work, to which he was a liberal contributor. Mr. Herbert L. Satterlee, general counsel for the league, is a son-in-law and heir of Mr. Morgan. J. Pierpont Morgan, jr., is one of the active directors of the league.

Gen. Horace Porter is president of the league. He was for many years an officer of the Pullman Co., which is a Morgan corporation.

Mr. Charles G. Glover is treasurer of the league. He is president of the Riggs National Bank, which is closer to Wall Street than any other bank in Washington.

Col. Robert L. Thompson is chairman of the executive committee of the league. He is an eminent financier of New York, whose great interests generally coincide with the colossal undertakings of the Morgan group. He is also the head—being chairman of the board—of the International Nickel Co., and holds the honorable post of president of the New York Metal Exchange.

Mr. J. Frederick Pams is director of the league. He is a New York society and yachting man, a friend of Mr. Morgan, and a member of Mr. Morgan's yacht club.

Mr. George von L. Meyer is a director of the league. Mr. Meyer was Secretary of the Navy in the Taft administration, and on March 3 signed the remarkable contract for the *Pennsylvania's* armor that has been the subject for unpleasant comment in Congress and elsewhere. He is a considerable stockholder in the New Haven Railroad, which is a Morgan concern, and is also a director in the Amoskeag Manufacturing Co., at Manchester, N. H., and has on the board as his associates Mr. F. C. Dumine, who helped Mr. Morgan to incorporate the Boston Railroad Holding Co., by which the New Haven was enabled to hold the Boston & Maine in spite of certain provisions of the Massachusetts law. Mr. Dumine is also a director of the Fore River Shipbuilding Co., which is on friendly terms with the Morgan group and affiliated with United States Steel.

NAVAL BILL IS REACTIONARY.

The policy embraced in the naval bill, which fails to provide for a Government armor-plate factory, is decidedly reactionary as compared to the policy embraced in the fortifications bill and the Army bills passed this session, providing the War Department construes the new language in the Army bill in the manner that the framers of the bill state they intended it should be construed.

For the first time in the history of the Government the fortifications bill and the Army bill appear to require practically complete Government manufacture of munitions of war. If the War Department so construes the new language, it will mean a saving of millions to the Government, because of the demonstrated ability of the Government to manufacture war munitions 35 per cent cheaper on the average than the prices at which the ammunition ring is furnishing such materials.

Here is the new language in the fortification bills:

Of each of the sums appropriated by this act, after deducting any amounts required to meet obligations authorized in previous acts to be entered into by contract, not more than 10 per cent may be used to purchase not exceeding 10 per cent in quantity or value of any article or material herein appropriated for that can be manufactured at the arsenals of the Ordnance Department, except when contract costs are less than arsenal manufacturing costs.

In explanation of this limitation the report accompanying the fortifications bill, prepared by Hon. SWAGAR SHERLEY, of Kentucky, said, in part:

The purpose of this limitation is to require practically the entire matériel for seacoast defense and for the Field Artillery, together with the ammunition for the same, to be manufactured at the arsenals.

As to the saving that will result from the policy of Government manufacture, the report contained the following:

In making the ammunition for these guns it has been found that the arsenal cost is approximately 39 per cent less than the purchase cost from private manufacturers.

The policy of manufacturing practically all the powder needed will, as indicated, be continued. Powder for the Army, now manufactured at the Picatinny Arsenal, is costing the Government 40 cents per pound, whereas a few years ago, prior to the placing of a limitation upon the price, the Government was paying for this character of powder 67 cents a pound and is now paying for such powder for the Navy 53 cents a pound.

NEW PHRASEOLOGY IN ARMY BILL.

Now, as to the Army bill. Let us take the paragraph dealing with Field Artillery ammunition for an illustration. In the Army bill for 1913 the wording of the act was as follows:

Ammunition for Field Artillery for Organized Militia: For procuring reserve ammunition for Field Artillery for the Organized Militia of the several States, Territories, and the District of Columbia, $500,000.

The effect of the words "for procuring reserve ammunition" was to give the Chief of Ordnance of the Army the privilege of either manufacturing the ammunition in the arsenals or of buying it from the ammunition ring at prices of from 20 to 60 per cent in excess of the cost of manufacture in the Government arsenals. Under this language large contracts have been awarded to the private manufacturers by the Chief of Ordnance, notwithstanding an average saving of 35 per cent to the people would have resulted on all work done in the Government arsenals. This wording was therefore satisfactory to the ammunition manufacturers. It in fact was worth hundreds and hundreds of thousands of dollars to the private manufacturers.

But in the Army bills passed in the present Congress and framed by the Military Affairs Committee, of which Hon. JAMES HAY, of Virginia, is chairman, the wording was changed to read as follows:

Ammunition for Field Artillery for Organized Militia: For manufacturing reserve ammunition for Field Artillery for the Organized Militia of the several States, Territories, and the District of Columbia, $3,000,000.

The words "for manufacturing reserve ammunition," instead of "for procuring reserve ammunition," are explained to mean that the appropriation can be lawfully expended only to manufacture this ammunition in the Government arsenals, and that the ammunition ring is going to lose some contracts that have been exceedingly fat.

The only possible doubt as to the completeness of the victory for the people in the Army bill is the construction which may be placed upon the new language by the Chief of Ordnance of the War Department, whose record is one of friendliness to the private manufacturers, to say the least. For instance, if the Chief of Ordnance should interpret the language "for manufacturing reserve ammunition" to make it optional with him as to whether it must be manufactured in public or private plants, and it is somewhat difficult to see how he could so construe it, the cause of complete Government manufacture would be likely to suffer.

It would be a very simple matter to change the wording of the bill so that it would be absolutely ammunition-ring proof, and in dealing with the war traffickers experience has shown that it is best to take no chances, as they have friends at court everywhere in the Government service.

If the sentence "for manufacturing reserve ammunition" is changed to read "for manufacturing *in Government establishments* reserve ammunition for Field Artillery, etc.," it will be an absolute guarantee of protection for the public whose money it is that is being used in these transactions.

As yet the Army bill has passed the House of Representatives only. If the Senate Committee on Military Affairs, in going over the bill, will, whenever the word "manufacturing" is used, add "in Government establishments" thereto, the members of that committee will clarify the phraseology absolutely, and will deserve the everlasting gratitude of their constituents.

GREAT BRITAIN ALSO IN GRIP OF THE TRUST.

Great Britain also has its own exclusive war trust, which consists primarily of five great firms, each controlling or connected with subsidiary manufacturers, and linked, directly or indirectly, with the others. The five firms constituting the British War Trust which are analagous to our Bethlehem, Carnegie, Midvale, and Du Pont are:

Vickers (Ltd.).
Sir W. G. Armstrong, Whitworth & Co. (Ltd.).
John Brown & Co. (Ltd.).
Cammell, Laird & Co. (Ltd.).
The Nobel Dynamite Trust.

The first four of the above can, with the aid of dependent and allied concerns, build every kind of warship complete in every part and ready to go into battle. They also make a great quantity of material for land defense, and might be described as universal death providers.

I am indebted to Mr. J. T. Walton Newbold and Mr. George Herbert Perris, of England, for most valuable and interesting information as to the business method of the British war trust and as to the men behind it. Mr. Newbold has written a pamphlet entitled "The War Trust Exposed," from which I quote the following:

HOW THE TRUST DOMINATES THE BRITISH GOVERNMENT.

The armament firms * * * as the years have passed have managed to secure a larger and ever larger share of Government orders. We will see them first at the Admiralty.

Some classes of work the firms have had almost as an exclusive monopoly. For instance, no torpedo boat and no destroyer has ever been built in a State yard. Of 81 submarines completed to date 69 have been privately built. Of 10 powerful battle cruisers—ships with most costly engines and heavy armament—2 have been constructed in the royal dockyards.

THE MEN BEHIND THE BRITISH WAR TRUST.

We have seen above how many and how subtle are the influences at work on behalf of the trust. We are all familiar with, and perhaps now some of us will have a clearer understanding of the meaning of, that specious plea so often made, that questions concerning the defense of the Empire should be removed from the dusty arena of party politics. The trust has taken good care that this is as far as possible already the case. It has its champions in both political camps; it has made friends with the hand that feeds it; it has left no stone unturned upon its triumphant way.

It has its friends at court, its directors in the Peers and Commons, supported by scores of shareholders; its voice is heard in the press and its apostles in the pulpits of cathedrals and tabernacles. The money changers of the world shoulder its abbes, its bishops, its pamphleteers, its patriotic orators, and its privy councillors, while of retired admirals, generals, and half-pay officers in its employ a special national reserve might be formed.

In the Lords there are, on the Liberal benches, four directors—three with their coronets newly burnished—Baron Aberconway, Baron Glenconner, Baron Pirrie, and Baron Ribblesdale.

Lord Aberconway, nephew of John Bright and a founder of the Eighty and National Liberal Clubs, was created a peer in 1911. He left two sons to watch the fortunes of the family in the Lower House. He is chairman of John Brown & Co. (Ltd.), and is naturally interested in Canadian and Russian questions.

Lord Glenconner is Mr. Asquith's brother-in-law, high commissioner of the kirk of Scotland, president of the Peebles Branch of the National Service League, chairman of the Tharsis Sulphur Co., and has large holdings in the Nobel Explosives Co.

Lord Pirrie entertained the first lord of the Admiralty when visiting Belfast. He is chairman of Harland & Wolff (Ltd.) and debenture trustee of John Brown & Co., Thos. Firth & Sons, and Coventry Ordnance Co.

Lord Ribblesdale, the fourth advocate of "peace, retrenchment, and reform," in the gilded chamber, stated at the last annual meeting of the Nobel dynamite trust:

"Our steady increase in business is due in no small degree to the constantly growing demand for war material. * * * In view of recent events in southeastern Europe, it does not, however, appear that anything approaching a condition of universal disarmament is within measurable distance." (London Times, May 31, 1913.)

Opposite these gentlemen sit the following directors: The Marquis of Graham, Earl Grey, Earl of Denbigh and Desmond, Baron Balfour of Burleigh, and Baron Hillingdon, besides a swarm of shareholders, among whom the most illustrious are Lord Midleton (formerly Mr. Brodrick) and the great proconsul of India, Earl Curzon of Kedleston.

The Marquis of Graham commands the Clyde section of the volunteer naval reserve and is a director of Wm. Beardmore & Co.

Earl Grey, late Governor General of Canada, and a vice president of the Navy League, is a debenture trustee of Armstrong, Whitworth & Co.

Earl of Denbigh and Desmond, a vice president of the Navy League and of the National Service League, is enthusiastic about the Canadian offer. He is a debenture trustee of the Fairfield Shipbuilding Co., part owners of the Canadian Shipbuilding Co.

Lord Balfour, senior elder of the Kirk of Scotland, is a debenture trustee of Wm. Beardmore & Co. and the Coventry Ordnance Co.

Lord Hillingdon represents Messrs. Glynn, Mills, Currie & Co., the bankers, as well as Vickers (Ltd.) and Wm. Beardmore & Co., of which he is a debenture trustee.

Lord Midleton is interested in Armstrong, Whitworth & Co., and Lord Curzon, who is nothing if not an imperialist, in Messrs. Hadfield's Foundry Co. (Ltd.), of which more anon.

In the House of Commons are many popular figures. There is Lord Claud Hamilton, director of Messrs. Hatfield's. Then Sir Alfred Mond, vice president of the Navy League and chairman of the Mond Nickel Co.; the brothers McLaren, scions of the new nobility of Aberconway; Godfrey M. Palmer, shareholder in Palmer's Shipbuilding Co.; Sir Stephen W. Furness, member of the National Service League and director of Richardson, Westgarth & Co.; Sir J. Compton-Rickett, treasurer of the Free Church Council; and Sir J. B. Lonsdale, member of the Solemn League of Ulster, the former interested in John Brown & Co. and Cammell, Laird & Co., the latter in Armstrong, Whitworth & Co.

Higher in the social scale, shall we say, stand Right Hon. Alexander Ure, the Right Hon. Lewis Harcourt, and the Right Hon. the Speaker of the House of Commons with shares in Vickers (Ltd.); the Right Hon. Walter Runciman and the Right Hon. Stuart-Wortley, respectively, shareholder and debenture trustee of Cammell, Laird & Co.

Outside of the trust, but a truly picturesque figure, is the honorable member for Portsmouth, Admiral Lord Charles Beresford, chairman of Henry Andrew & Co. (Ltd.), of Sheffield (according to "Who's Who in Business," specialists in "steel for rifles, swords, shot, and shell").

The churches are represented by: The bishops of Chester and Newcastle, both members of the National Service League and shareholders in Vickers (Ltd.); the bishops of Adelaide, Newport, and Hexham, interested in Vickers (Ltd.), Armstrong, Whitworth & Co., and John Brown & Co.; Dean Inge of St. Paul's, like Baron Kinnaird, president of the Y. M. C. A., and Sir Walter Runciman, a well-known Wesleyan, are shareholders in Vickers (Ltd.).

After this "laying on of hands" one is not so horrified to find that the chairman of Armstrong, Whitworth & Co. (Ltd.) has been given the order by a grateful Government of Commander Jesus Christ of Portugal.

* * * * * * *

HOW THE BRITISH WAR TRUST SECURES BUSINESS.

The War Trust has more direct methods even than those enumerated above of facilitating business.

For instance, this is the kind of thing which seems to hold favor in certain Liberal circles. Mr. Tudor Walters, speaking in Brightside, Sheffield, some years ago, is reported to have said that—

"When he secured from the Government a large order for Sheffield, he was not so simple as to go shouting about it in the House of Commons. If you shout, he said, you can't do much. If you want to accomplish things, you have to go to work quietly and carefully. It is not for me to shout about orders; it is for me to go to the war office and the admiralty and get them." (Sheffield Daily Independent, Aug. 1, 1907.)

Then, the armament firms have a great predilection for ex-members of the services with high qualifications as technical experts or with a knowledge of the little habits of the denizens of Whitehall and the ordnance factories.

The Fairfield Shipbuilding Co. have among their directors Admiral Sir Digby Morant, formerly superintendent of Pembroke dockyard.

The Coventry Ordnance Co. in 1910 secured as managing director Rear Admiral Bacon. From 1907 to 1909 he was director of naval ordnance and torpedoes at the admiralty.

The Hadfield Foundry Co., Palmer's Shipbuilding Co., and Richardson, Westgarth & Co. had the late Admiral Sir Archibald Douglas on their boards. He had been vice president of the ordnance committee.

At the annual meeting of the foundry company in 1908, that darkest hour before the dawn of 1909, he told the shareholders that larger orders must necessarily come from the Government next year.

Armstrong, Whitworth & Co. have obtained Rear Admiral Ottley, sometime secretary of the Committee of Imperial Defense, to advise them. As naval attaché in Japan, Italy, Russia, America, and France, and as director of naval intelligence he must have seen and heard much.

At any rate, Sir Andrew Noble said, speaking of him and Sir Percy Girouard, that they "had found their assistance most valuable." (Financial Times, Apr. 15, 1913.)

From Woolwich Vickers-Maxim obtained Sir Trevor Dawson, now managing director. Birmingham Small Arms have this year engaged the late manager of the Royal Gun and Carriage Factories. The Nobel Explosives Co. have at the head of their cordite department Col. Sir F. Nathan, late superintendent of the Government Cordite Works at Waltham.

From every grade and every dockyard and every ordnance factory the trust has taken them by scores at twice, four times, and sometimes more than that, their former salaries. These ex-officials can at any time visit their former haunts, and in private conversation, by correspondence, and in various ways elicit a great deal of useful information. A firm has actually got its office inside one of the fitting shops at Portsmouth. Specifications, designs, and all kinds of valuable hints are obtained by their agents with the full agreement of the admiralty.

On the other hand, the frequency with which members of the inspection department are taken into private employ can not but have a demoralizing effect on a number of the officials responsible for passing contract work, and the way in which the officers' wants and fancies are considered in the matter of accommodation all helps to ingratiate the firms in what will sooner or later be influential quarters. For instance, on the "Scout" type of ship the commander had as much room allotted to him as 280 of his crew.

Just as in the public schools and the colleges, "it is a way they have in the Army, it is a way they have in the Navy," to "leg" each other up. And the firms know how to exploit this team spirit to their own advantage.

HOW SHALL WE OVERCOME THE WAR TRUST?

In reading this account of its magnitude and its activity, its power and its resourcefulness, the reader must have wondered how any successful attempt can be made to control the trust. Whatever action is taken must be international, and pressed on by the peace forces in every land. Especially must the labor and socialist parties in the various parliaments, and their propagandist organizations among the people, at once forge the weapon and wield it against the universal tyranny of dividend-mongering militarism.

In this country as elsewhere it devolves upon us to expose the vested interests that lurk behind the "patriotic" societies. Let us show the directors and shareholders of armament firms supporting and encouraging the advocates of the "Nation in arms"; the builders of everybody's battleships fostering the navy league; the patron of the all-Empire aerial-defense campaign, Admiral Fremantle, now demanding "provision for aerial defense under all conditions and at any cost"; then presiding over the British Deperdussin Aeroplane Co., estimating how many airships the Empire will require "within the next two years."

But above all let our aim be to manufacture the Nation's war material in the national yards and national arsenals. More work should be done in the dockyards, and at Woolwich, Enfield, and Farnborough. Plants that are idle should be set working, and machinery installed for the making of the largest ordnance and ammunition, for rolling armor plate, and constructing engineering equipment. If the present establishments are not favorably situated or capable of expansion, then the Admiralty should put down factories, forges, and slipways at Rosyth, buy its mines and its own raw materials in Fife, Lanark, and elsewhere, and set itself to compete against the trust. Sooner or later the whole industry must be nationalized, and the sooner the better. Every year the firms add millions to their stocks. The vested interests of capital and labor are becoming ever more powerful and more far-reaching. Only by nationalization can we strike at the heart of the octopus.

THE GREAT SPEECH OF LIEBKNECHT IN THE REICHSTAG.

I will here insert excerpts from the translated speech of Carl Liebknecht, which created a profound impression throughout Europe at the time it was delivered:

DR. LIEBKNECHT'S SPEECH IN THE REICHSTAG, APRIL 18, 1913.

In these days, when conservative papers can cry, "Lord, give us a war!" and military writers pray that we may be saved from false righteousness, it is interesting to let a little light into the dodges and furtive proceedings of our armament firms. Vorwarts (Vorwarts had produced evidence of a secret ring formed by the armament firms to increase their already immense profits at the expense of the German taxpayer) has recently given documentary proof of the concern of these firms for the good of the navy, and shown how they batten like a vampire on the body politic. As to their patriotism—we all know that capital has no country—that follows necessarily from its absolutely single-minded attention to profit. The contractor makes delivery wherever he is assured of getting his money; it is no concern of his if the arms he has exported are intended for employment against his own nation. My friend Sudekum has just brought to notice a good example of this in the works at Dollingen, which are largely financed with French money and in which French and German capitalists cooperate with touching solidarity in bleeding the German people.

The minister of war should also consult the documents in the Schroeter case. He will find there a letter from the German Arms &

Ammunition Factory, asking for a paragraph to be inserted in the Figaro stating that the French War Office intends to accelerate the proposed provision of new-pattern machine guns. This company—no doubt pursuing unprecedented methods no other firm would think of—proposed to spread false news simply in order to create a demand for further expenditure in Germany and so to bring grist to its mill.

* * * * * * *

Needless to say, I have informed the minister of war of these facts. The minister has taken every step that the case demands, proceeding both against the military and the civilian officials implicated; the inquiry is now concluded and has established what I have said down to the last iota. There is no longer any risk of defeating the object of the inquiry, and I feel bound, therefore, to bring the matter up now in the interest of the German nation and of the peace of Europe.

To return to the Dollingen firm, the intimate connection between this firm and Die Post is common knowledge. The Rhenish Westphalian Gazette also bears on its brow the brand of the capital interested in armaments. These capitalists coin money out of international discord, working into one another's hands from country to country.

The affair of the Arms & Ammunition Factory could not have escaped the attention of the war minister; it was exposed in Vorwarts. But last year the war department not only provided the private firms their immense profits, but even reduced the activity of the State arsenals in order to give out certain orders to private industry, as the maintenance of the latter is in the interest of war administration. I made no complaint against the war minister at the time, as so long as such private concerns exist the position with regard to them is admittedly somewhat embarrassing. But this system must be made an end of. It is essential that the hands of the Empire shall remain clean, that the Government shall have no sort of association with firms convicted of such practices. The Krupp firm should receive no orders whatever under the new military estimates. The war-material industry must be nationalized in order to remove forever this danger of interested makers of panics.

* * * * * * *

The minister for war says it is not proved that higher officials of Krupps were involved in the affairs. We are accustomed to the method of sacrificing petty officials, hanging the petty thief, and letting the great one off scot free—a knightly, chivalrous method! But was Herr von Dewitz one of Messrs. Krupps' petty officials? He was the custodian of all these things; in his safe they were confiscated by the examining magistrate in Berlin.

* * * * * * *

The minister for war asked how much we owe to the firm of Krupps. I ask, How much does the firm owe to the German people?

* * * * * * *

Krupps as patriots! Does the minister for war remember that in 1868 Frederick Krupp, ironmaster in Essen, wrote a letter to a certain Napoleon III of France? It is printed in the well-known Briefe deutscher Battelpatrioten, which runs as follows:

"Encouraged by the interest which Your Gracious Majesty has shown in a simple industrialist and the fortunate results of his endeavors and his unheard-of sacrifices, I venture once more to approach Your Majesty with the request that Your Majesty will condescend to accept the accompanying album. It contains a collection of drawings of various articles manufactured in my workshops. I venture the hope that the last four pages, which show the steel cannon which I have manufaceured for various high powers of Europe, will be worthy of Your Majesty's attention for a moment and will be an excuse for my boldness.

"With the deepest respect and the greatest admiration"—one might add, and with the hope of important orders—

"Your Majesty's most humble obedient servant."

And in order that you may know whose blessing the firm of Krupp thereby secured I will read to you the reply of Napoleon III. It is as follows:

"The Emperor has received the album with much interest, and has commanded that you shall be thanked for it and given to know that His Majesty has a lively desire for the success and expansion of an industry designed to render such important services to humanity."

It only remains for a halo to be quartered in the Krupp coat of arms with the name Napoleon III inscribed in it.

* * * * * * *

I referred yesterday at the beginning of my speech to the armor-plate concerns. You are aware—all the world knows it; there are many gentlemen here who know the ins and outs of these things better than we on these benches—the armament interests are all associated together in a ring. It is also common knowledge that Krupp's is the foremost name, the greatest power in the armament industry. Well, if what I have laid before you goes on, and can no longer be denied, in this firm, the most respected of them all, what an insight that gives us into the whole industry! What are we to expect in the other undertakings associated with the industry? The utmost caution becomes essential; everything is suspect. The minister for war should institute a general and remorseless investigation into the proceedings of every firm. For if this can happen in Krupp's and in the Arms and Ammunition Factory, there is nothing to guarantee us against similar practices in other firms—nay, I might almost say that there is a good deal of probability that their methods will be no more respectable than those of these two great firms.

* * * * * * *

I have proved that the German Arms and Ammunition Factory spreads false news in foreign newspapers in order to create a demand in Germany for further military expenditure. I have shown that the firm of Krupp engages in bribery to secure the betrayal of military secrets, and has done so for years, and, at the very least, with the knowledge and instigation of highly placed employees of the firm. These are matters of the utmost importance, which render it necessary that the Reichstag should reconsider its attitude to the question of our armaments and the method of providing the required matériel. Let me point out that to cultivate accessibility to bribes in superior or inferior officials, as the Krupp firm has done, is indeed no trifle. It is to corrupt the whole administration. It is to render the officials doubly vulnerable by any offers of bribery from foreign agents. That is no "large-hearted manifestation of patriotic feeling" wherewith to earn such thanks as the minister of war expressed yesterday. These people who, as Krupps and Dollingen and the Arms and Ammunition Factory, talk so finely and then descend to these low business tricks, these are the same people who will pocket the greater part of the fresh millions of pounds that are being extracted from the nation's pockets; the same people into whose pockets untold millions flow each year; the same people who draw the biggest profits from present-day militarism and the capitalist system, and who are the worst intriguers against popular liberties, the instigators of oppressive measures, the loudest shouters for vindictive legislation, for exceptional laws. * * * These pattern patriots must be judged by their actions, which, to say the least, border on high treason. * * *

* * * * * * *

I will place the arms and ammunition factory before you in yet another rôle. We have now documentary proof of the international linking up of the armament concerns. The German Arms and Ammunition Factory, the Mauser Arms Factory, the Austrian Arms Factory of Vienna, and the National Factory in Belgium concluded an agreement in 1905 in regard to Russia, Japan, and Argentina, and later a second agreement in regard to all other countries are reserved to each firm. * * * The agreement guarantees profits in the same way as the navy contractors have done and guarantee to each of the various firms the monopoly of the exploitation of particular countries. Supplies of arms to Bulgaria and Roumania are the monopoly of the Austrian firm. This should be brought to the knowledge of all friends of peace in Austria. This document shows as plainly as could be the extreme danger to peace offered by the armament industry, and it shows the unscrupulous and unpatriotic character of the armament concerns. These are the great patriots who dare to insult us as anti-patriots. The firm which sent that letter to Paris is a partner in the international concern which supplies Russia with arms. We certainly do not underrate the dangers to peace in the stealthy wirepullers of the armament press or the activities of that camarilla of officers whose representative, the crown prince, made a demonstration in this House against the imperial chancellor. (The President called the speaker to order for this utterance.) But the greatest danger lies in the armament shareholders and their servants, who work unremittingly for the piling up of inflammable material and the setting of the fuse. Immediately after the debates in the Reichstag, which raised so much dust and in which the Post was itself involved, that paper did its utmost to arouse feeling against France by a series of attacks, which brought down the chancellor's condemnation. You need not wonder if, in view of all this, we continually warn the great mass of the people that behind all the gaudy pomp of patriotic fooleries stands nothing but the sordid greed of gold.

LIEBKNECHT REFUSED TO SUPPORT A WAR MEASURE IN THE REICHSTAG, AND WAS ORDERED TO THE FRONT.

When war broke out in Germany it did not surprise Carl Liebknecht. It was what he expected, what he had predicted. He believed for years that war was inevitable, because of the seeds of distrust and suspicion that the war trust had sown and was sowing in the minds and hearts of the peoples of Europe.

And when war actually came Carl Liebknecht had the courage, or the audacity, or the foolhardiness, or whatever you choose to call it, to stand all alone in the Reichstag and vote against a war measure. The immediate result was that the German Government, although he is several years over 40, selected him to send to the front. To his memory, for he appears never afterwards to have been heard from, Witter Bynner, the poet, has erected the following monument:

CARL LIEBKNECHT.

I love thee for one hero, only one.
My spirit straightens, like the tempered blade
Of his unmasterable weapon made
In heaven's high forge, not hell's. I had begun
To dread thy horrid shadow in the sun,
To hate thee for thy national parade
Of heathen men idolatrous of trade,
Shouting the great commandment of the gun.
But thou hast bred out of thy land a man
Of braver metal than thy generals;
Above the thunderbolt his courage calls.
It is thy founder and thy guardian,
It is thy hero, Liebknecht, who alone
Under the lightning lays the cornerstone.

TABLES REVEAL HOW UNCLE SAM IS BEING GROSSLY OVERCHARGED BY THE AMMUNITION RING.

The following tables constitute an excellent argument for the Government armor plant advocated by Secretary of the Navy Daniels. The figures were furnished by Col. George Montgomery, commandant at Frankford Arsenal, Philadelphia, and show the total arsenal costs and total contract costs for ammunition recently under manufacture at Frankford Arsenal. Had these orders been manufactured at the arsenal at Rock Island, Ill., where the Government has a power plant in the Mississippi River, and consequently considerably cheaper power, even a better showing could be made on the side of Government manufacture of the munitions of war.

TOTAL ARSENAL COSTS INCLUDE ALL OVERHEAD CHARGES.

The total arsenal costs include 15 per cent to cover administration, depreciation, insurance, and interest charges.

A striking feature of the comparisons of Government cost of manufacture as compared to the private contractors' prices is that the Government works its employees but 8 hours a day, while the private contractors have in the past worked their men 9 and 10 hours a day, and in some instances 12 hours a day and 7 days a week. Government employees also receive higher wages for the shorter days. Nor is that all. Uncle Sam pays his men for 15 days' annual leave of absence, for 7 national holidays, and for 13 Saturday afternoons in the summer time, during which time he receives no labor in return, yet the Government cost of manufacture, including 15 per cent for depreciation and interest, is from 20 to 50 per cent below the prices charged by the ring of private manufacturers.

TABLE I.—*Manufacture of artillery ammunition.*

[Statement of total arsenal costs and total contract costs for ammunition being manufactured at the Frankford Arsenal and provided for in orders issued between July 1, 1912, and Apr. 25, 1913.]

Articles.	Quantities under manufacture.	Total arsenal costs per unit.	Aggregate total arsenal cost.	Contract price per unit.	Contract cost per unit.	Total contract cost.	Saving over contract costs.

3-inch common steel shell	7,077	17.93	18.47	130,712.00	16.75	118,539.75	12,172.25
6-inch fixed high-explosive shrapnel	10,000	13.17	13.17	131,700.00	10.15	101,500.00	30,200.00
Grand total contract cost							$1,112,334.95
Grand total arsenal cost							800,120.11
Loss							312,214.84

TABLE III.—*Manufacture of small-arms ammunition.*

Statement of total arsenal costs and total contract costs for ammunition manufactured at the Frankford Arsenal provided for in orders issued and completed between July 1, 1912, and June 30, 1913.]

Articles.	Quantities manufactured.	Total costs per thousand.	Aggregate total cost.	Contract price per thousand.	Contract cost per thousand.	Total contract cost.	Saving over contract.
Caliber .30 ball cartridges	55,000,000	$27.08	$1,489,400	$37.77	[1]$38.09	$2,094,950	$605,550
Automatic-pistol ball cartridges	5,000,000	16.28	81,400	18.72	18.80	94,000	12,600
Caliber .38 revolver ball cartridges	7,000,000	12.39	86,730	10.91	11.27	78,890	−7,840
Grand total, contract cost							$2,267,840
Grand total, arsenal cost							1,657,530
Saving							610,310

[1] This cost includes the actual cost of inspection.

TABLE IV.—*Purchase of small-arms ammunition.*

[Statement of total contract costs and of total arsenal costs for ammunition purchased from outside manufacturers covered by orders given between July 1, 1912, and June 30, 1913, under which deliveries were completed before Aug. 29, 1913.]

Articles.	Quantities ordered.	Contract price per thousand.	Contract cost per thousand.	Total contract cost.	Arsenal cost per thousand.	Total arsenal cost.	Contract cost over arsenal cost.
Caliber .30 ball cartridges	8,000,000	$37.77	[1]$38.09	$304,720	$27.08	$216,640	$88,080
Automatic-pistol ball cartridges, caliber .45	800,000	18.72	18.80	15,040	16.28	13,024	2,016
Caliber .38 revolver ball cartridges	1,000,000	10.91	11.27	11,270	[2]12.39	12,390	−1,120
Grand total contract cost							$331,030.00
Grand total arsenal cost							242,054.00
Loss							88,976.00

[1] This includes the actual cost of inspection.

[2] The increased cost of caliber .38 revolver ammunition is due to the fact that the presses on which it is partly made are not equipped with automatic feeds which was not done because of the probability that very little of this ammunition will be made in the future.

MORE EVIDENCE AS TO WHY ARSENALS SHOULD BE GIVEN ALL CONTRACTS FOR MUNITIONS OF WAR.

Additional evidence and some of the best arguments as to why the arsenals and navy yards should be given contracts for munitions that have heretofore been going to the War Trust has been given, unintentionally perhaps, by Gen. Crozier himself.

Let us consider, for instance, the testimony of Gen. Crozier as to the remarkably low cost of manufacture at the Rock Island Arsenal, as compared with cost in private plants, given before the House Appropriation Committee April 2, 1912:

The CHAIRMAN. Do your figures show the comparative cost of manufacture and purchase?

Gen. CROZIER. Yes.

The CHAIRMAN. Put them in the record, please.

Gen. CROZIER. I will mention a few of them for the record. I think I can mention them more summarily, so they can be better comprehended in the record, than if I put in all of these details. I will take the limbers for the 3-inch rifles. The average of three contracts gave a price of $1,518 a piece for those limbers.

Mr. CANNON. What is a limber?

Gen. CROZIER. A limber is the forward portion of the wagon which transports the gun, the forward portion of the gun carriage; and the average of five orders for manufacture at the Rock Island Arsenal was $684 apiece. The arsenal cost was less than half the purchase price.

* * * * * * *

Gen. CROZIER. Now, for the 3-inch caisson, the average of five contracts shows a price of $1,708, and the average of six manufacturing orders given to the Rock Island Arsenal is $1,081. The 3-inch gun carriage proper—that is, the vehicle on which the gun rests and from which it is fired—gives as the average price three contracts, $3,268, and the average cost under five manufacturing orders at the arsenal was $2,341.

Mr. CANNON. Does that include overhead charges?

Gen. CROZIER. Yes, sir.

These figures, representing the cost of manufacture at the Rock Island Arsenal, include all overhead charges, such as pay of officers, interest on investment, insurance, depreciation of plant, and so forth.

COST IN ARSENAL, $2,510; WAR TRUST PRICE, $3,398.

Testifying before a House committee January 13, 1912, Gen. Crozier said:

We have recently manufactured gun carriages and are doing it still for 3-inch rifles; that is, field guns, at $2,510.60, the exact cost. We purchased those rifle carriages from experienced manufacturers, who had had preceding orders for the same thing, for $3,398.82, an increase of 35.4 per cent over our own price. Our carriages were made at the Rock Island Arsenal.

We have manufactured there, at the same arsenal, caissons, for $1,128.67, and we have purchased the same caissons from private manufacturers who had had previous orders for them, so that they had experience in the manufacture, for $1,744.10, which is 54.6 per cent greater than our own price.

During the same hearings Gen. Crozier stated as follows:

At the Springfield Armory the principal manufacture is small-arms rifles. We make a few other things, but the manufacture is almost entirely of the small-arms rifle. We manufacture that rifle for about $15, and in doing so I take into account what I think should properly be taken into account in the cost; but the Springfield Armory, like the other arsenals, is maintained as an arsenal of storage and issue, as well as a manufacturing place; and, therefore, in computing these costs, I have subtracted from the total expense of the Springfield Armory those portions which I consider result from its character as an arsenal of issue and storage. Unless somebody goes into the details quite closely, there may be a question as to whether I subtract quite as much as I ought to.

Therefore, I, last year, for the purpose of satisfying some persons who might have some doubt, made up what I might call an exaggerated cost of the rifles at the Springfield Armory—that is, I took every cent of money that was sent up to the Springfield Armory and charged it to the rifle. Whether it was for the payment of the clerks that were used in the issue of stores, the payment of the storehouse force, whether it was for the payment of the watchmen—they are the guards and custodians of the valuable property we have up there—I charged all the pay of officers and all the pay of everybody concerned to the rifle, and by that means I arrived at a cost of the rifle of $17.64 instead of $15—that is, I found I had to add to the cost as I had reported it about 17 per cent. Now, that then became a statement of an exaggerated cost which, whatever the rifle might cost properly, it could not possibly reach. It must have been below $17.65; and if it were possible to obtain the opinion of an expert, I would be glad to ask him if he thought the Springfield rifle could be produced by anybody else anywhere and purchased for $25. My own opinion is that you could not get it as low as $25 from any manufacturer.

The rifles are also made at the Rock Island Arsenal at practically the same or a lower figure.

Authorship of the Farewell Address.

EXTENSION OF REMARKS

OF

HON. CLARENCE B. MILLER,

OF MINNESOTA,

IN THE HOUSE OF REPRESENTATIVES,

Monday, February 22, 1915.

Mr. MILLER. Mr. Speaker, we have listened to-day to the reading of Washington's Farewell Address. This historic custom, performed annually upon the natal day of our first President, is greatly to be commended. It should be of interest to Members to know something of the inside history associated with the writing of that great document. Hon. SIMEON D. FESS, of Ohio, one of the most distinguished Members of this House, some years ago made careful research and wrote a most scholarly account of the writing of the Farewell Address. I have secured permission to extend my remarks for the purpose of having printed this historical account written by Representative FESS, which is as follows:

SOME NOTES UPON THE AUTHORSHIP OF THE FAREWELL ADDRESS.

To anyone save the antiquarian the merest hint that the famous state paper of our first President was not his but the work of another would appear sacrilegious. Yet this subject has enlisted the attention not only of the iconoclast but of the investigator. There are those who claim that the inception, if not the execution of the instrument, is due to Madison. There are others that claim Jay had much to do with it. However, the friends of Hamilton make out the strongest case for his authorship.

The "Farewell Address," as its name implies, was written as a sort of last will and testament to a much-loved people by a much-respected man upon the occasion of their official separation. The thought which finally took this form was occasioned by the desire of Washington at the close of his first administration to decline a reelection. The bitter attacks of his enemies, so undeserved, drove him to such a decision. With this in mind he wrote to Madison under date of May 20, 1792: "Under these impressions permit me to reiterate my request to you at our last meeting, namely, to think of the proper time and the best mode of announcing the intention, and that you would prepare the latter. I would without apology desire that you would turn your thought to a valedictory address from me to the public." It is of interest why the great President consulted Madison rather than Hamilton. The matter of his declination to accept a second term was freely discussed. The Federalists with Hamilton at the head looked upon it as little short of cowardice. The brilliant Secretary of the Treasury was impatient in his insistence for a continuance in office of his chief. He forced it upon him that good government was on trial, that his policy as announced could win success if given a fair trial. To decline a reelection meant a reversal, and perhaps an irretrievable disaster. This alone would induce Washington to seek assistance at the hands of some other. Again, the peculiar relation existing between Washington and Hamilton had subjected the former to such criticism as directed against the political theories of the latter. This fact alone would induce Washington to avoid inviting the criticism. On the other hand, Madison, while a friend of the President, was identified in theory with his opponents. This left the way clear to seek him out to assist in the preparation of the valedictory. His ability to do it was well known, and to no one better than to the valedictorian. His part in it would allay criticism and give it the air of absolute sincerity. Under date of June 20, 1792, Madison submitted a draft, but the hurry of events, both domestic and foreign, at the close of the first term convinced Washington, if not the whole people, of the imperative necessity of accepting a second term. Further consideration of such an address was deferred, and nothing is heard of it for four years.

By this time Hamilton was out of the Cabinet. While his advice was sought as before by the President, and while there is no evidence that his views upon the tenure of the Executive had undergone any change, it was understood that Washington desired to establish a precedent against long continuance in the office of President, thus putting to rest unfounded charges of irresponsible scribblers, charging monarchical tendencies of the first President. His original intention to address the people in the form of a valedictory was revived at the close of his second term, and quite naturally he applied to his most valued friend and pamphleteer. Under date of May 15, 1796, he wrote Hamilton, submitting a rough draft of an address and requested him to put it in form. He had urged that certain things should be emphasized so as "to insure my intention not to extend the Executive powers beyond the Constitution." He expressed the hope in the letter that this "may blunt the shafts directed at me." He refers to expunging certain words from certain pages, which argues his extreme concern in the character of the address. He also urges the omission of all personalities, allusions to pointed measures, and expressions inviting personal attack. "All these ideas and observations are confined, as you will readily perceive, to my draft of the valedictory." He then requests: "If you form one anew, it will of course assume such a shape as you may be disposed to give it, predicated upon the sentiment contained in the inclosed paper." The significance of this letter can not be misunderstood. He was seeking the aid of Hamilton, as four years before he had sought the aid of Madison, to put in form an address. It leaves little latitude to Hamilton except

to dress up the skeleton. This should be expected. Washington did not presume literary talents nor the rôle of scholarship. His limitations here were better known to him than to others. The superior talents of the brilliant New Yorker were common knowledge, known to none better than to Washington. His intimacy with him would lead him to seek out Hamilton before anyone else to correct a manuscript or to recast it, or even to write it originally. The matter had been taken up by them prior to the Washington letter of the 15th of May. On the 10th of May Hamilton wrote to Washington: "When last in Philadelphia you mentioned to me your wish that I should redress a certain paper which you had prepared. As it is important that a matter of this kind should be done with great care, and at much leisure touched and retouched, I submit a wish that as soon as you have given it the body you mean it to have it may be sent to me." This letter proves that at this time Washington desired the assistance only of Hamilton to put the former's thought in language. Five days later Washington replied, and continued: "Inclosed (in its rough state) the paper mentioned therein, with some alteration (since you saw it), relative to reference at foot. Having no copy before me except the quoted part, nor of the notes from which it was drawn, I beg leave to recommend the draft now sent to your particular attention. Even if you should think it best to throw the whole into a different form, let me request, notwithstanding that my draft may be returned to me (along with yours) with such amendments and corrections as to render it as perfect as the formation is susceptible of; curtailed if too verbose and relieved of all tautology not necessary to enforce the ideas in the original or quoted part. My wish is that the whole may appear in a plain style and be handed to the public in an honest, unaffected, simple part."

It would be difficult to make the intention of the writer clearer than expressed in these two letters. The retiring Chief Magistrate has something to say to the public, and while it is well defined in his mind, he desires the aid of a skillful pamphleteer. his intimate friend, to put it in proper phraseology. In other words, he desires his draft read and corrected, if necessary, or rewritten entirely, if best to do so, with the injunction that his own draft be returned to him. This has been the uniform custom of all the Presidents from Washington to Roosevelt—to consult eminent ability before publishing State documents. It is a well-known fact that the famous Monroe doctrine was written by John Q. Adams, and not by the President; that Jackson's famous nullification message was written by Livingston; that Lincoln's first inaugural address was submitted to Seward for correction; that Harrison's reciprocity message was written by Blaine; that Cleveland's Venezuela message was written by Olney; and that McKinley's famous message upon the "Administrative Entity of China" was the handiwork of his distinguished Secretary of State.

When Gen. Harrison submitted his inaugural address to Webster for correction the latter emasculated it. He told a friend his task was a murderous one. He had to slay Roman consuls and destroy many distinguished men of state.

On the 20th of May Hamilton replied to Washington's letter: "The suggestions which can be submitted must be very general, and liable to many modifications according to circumstances. It would seem in almost any case advisable to put forward a calm exhibition of the view by which our Government has been influenced in relation with present wars with Europe." He then points out items which should be mentioned, namely, our interest in peace, our incapacity for external effort, our interest in neutrality on matters of European politics, the faithful discharge of all our debts, a full statement of our relations to France that we may still retain the friendship of other nations without offending any. A careful reading of the address will show the treatment of our foreign relations was as suggested in this letter. Six days after the date of this letter, which must have been soon after its receipt, Washington wrote: "Having from a variety of reasons—among which is a disinclination to be longer buffeted in the public prints by a set of infamous scribblers—taken my ultimate determination to seek the post of honor in a private station, I regret exceedingly that I did not publish my valedictory address on the day after the adjournment of Congress. This is one of the reasons which makes me tenacious on the draft I furnished you." He was concerned about the most opportune time for its publication that it would not give color to the charge of his enemies that it was the immediate result of a man disappointed in his ambitions. Hamilton furnishes him with an address, whether his own or Washington's corrected it does not appear. On the 10th of August Washington writes to Hamilton acknowledging the receipt of his letter, with the inclosure, and highly commends the latter, believing the "sentiments are just and such as ought to be inculcated." He questions its length and says, "all the columns of a large gazette would scarcely contain the present draft." The inference here is that Hamilton had submitted a new draft.

Fifteen days later Washington again writes to Hamilton: "I have given the paper herewith inclosed serious and attentive readings, and prefer it greatly to other drafts," and so forth. This proves more than one draft; and since no reference is made to a second from the pen of the President, it stands that Hamilton must have written at least two, and possibly three. This view is favored by another item in the letter of the 25th: "I should have seen no occasion myself for its undergoing a revision; but, as your letter of the 30th ultimo which accompanied it intimates a wish to do this, and knowing it can be more correctly done after a writing is out of sight for some time, I send it with a request that you return it as soon as you have carefully reexamined it." He urges that mature consideration be given to those parts upon which marginal notes have been made in pencil. The paper returned was one that Hamilton had already examined. Whether it was entirely his own does not appear. It was returned, with marginal notes entered by Washington, for reexamination.

Washington had long desired the establishment of a national university. On the 1st of September he again wrote to Hamilton, deploring the omission of any mention of such an institution. He enlarged upon the importance of a university located at the seat of government, where students can come together from all parts of the country to study not only the sciences and the arts but to observe the practical operations of the Government, which would assist in welding all the parts of the Union. On the 6th of September he urged upon Hamilton expedition in sending the draft: "If you think the idea of a university had better be reserved for my speech at the opening of Congress I will defer it. Even in that case I would pray you, as soon as convenient, to make a draft for the occasion, predicated upon the ideas with which you have been furnished." All this proves that on the 6th of September, 13 days before the famous address was given to the public, Washington was expecting a revised copy from the pen of Hamilton.

Washington's insistence upon predicating the draft upon the sentiments suggested is proof that the thought in its inception was his. His anxiety to have it properly expressed, his urgent council with Hamilton, is certainly proof that this distinguished gentleman had much to do in wording the instrument.

Jared Sparks and the other biographers of his day throw little light upon the authorship. They all mention it, but are satisfied to assert the item is of little or no importance.

The original copy from which the final draft was made was handed to the printer, Claypool, who says it was in the handwriting of Washington. This last statement is confirmed by Sparks. It consisted of 32 pages of quarto letter paper, sewed together as a book. In places whole paragraphs are erased and others substituted. Many interlineations occur. The original was purchased from the Claypool estate by James Lenox and is now in the famous Lenox Library, of New York.

In the preface of Irving's Life of Washington is found a lucid description of the document from the pen of its owner. He declares little doubt can be entertained as to Washington's authorship, alleging, however, that it has the marks of collaboration. He says Washington consulted Hamilton particularly and minutely on many points connected with it. He thinks that he (Hamilton) at different times had submitted at least three drafts, the second of which appears in the published Works of Hamilton, edited by J. C. Hamilton.

The Jay letter to which Lenox refers was written to Judge Peters, of Pennsylvania, in 1811, 15 years after the publication of the Address. At this time the question of authorship was agitating some men, and Jay was solicited to publish the facts. He wrote, "The history of the address is not unknown to me. I shall now reduce it to writing and commit it to your care." Then the explanation follows: "Some time before the address appeared Col. Hamilton informed me that he had received a letter from President Washington and with it a draft of a Farewell Address which the President had prepared and on which he had desired our opinion. He—Hamilton—observed to me he thought it best to leave the draft untouched and in its fair state, and to write the whole over, with such amendments, alterations, and corrections as he thought advisable, and that he had done so. I suggested giving it a further critical examination, but he declined it, saying that he was pressed for time and was anxious to return the draft to the President without delay. The President's draft remained fair and not obscured by interlineations."

This letter adds little if anything to the Washington-Hamilton correspondence. It does not prove that Hamilton is the author, but quite the contrary may be inferred.

The Hamilton draft is in the State Department. The final alterations by Hamilton are printed in Lodge's edition of Hamilton's Writings, and also in Washington's Writings, edited by Ford, who has printed in parallel columns the final draft as corrected by Washington, and the final draft of Hamilton. The marked similarity of these drafts puzzles scholars to know how "two persons should express the same ideas in substantially the same language, and yet with much diversity in the construction of the sentences and the position of the words."

This similarity in thought and diversity in expression confirms the position that the thought was Washington's and the language in the main Hamilton's. While there is little evidence that Washington desired Hamilton to write his valedictory to the people, there is abundant proof that he desired him to put his thought in good form. In all his solicitations he is specific in his insistence upon returning his original draft, no matter what corrections may be made. Hamilton's various letters show he so understood the President.

Timothy Pickering, closely identified with the administration, said: "'Light was reflected upon it in all stages of its preparation from the minds of Hamilton, Madison, Jay, and of the heads of the several departments of the Government." He adds: "When it is considered that it was Washington's own original conception, that he wrote its heads to Madison in the first instance, threw it again into form before he sent it to Hamilton, added to and altered Hamilton's draft, copied it over and over again with his own hand, keeping it under his controlling judgment all along, and revising it with his own pen to the last, it can not be a question that he is fully entitled to the character of its author."

Viewed externally the evidence strongly supports the contention that it was the result of collaboration between Washington and Hamilton. This view is enforced by contemporaneous testimony. When studied from internal evidence, or that which appears upon the face of the instrument, there is nothing to lead to a different conclusion. At least this much may be affirmed with some degree of certainty, that the address is Washington's in its conception, its thought, its sentiment; while in its form of expression, its vigor of language, its logical arrangement it is Hamilton's. Whatever of honor may be due to Hamilton for his part in it, the fact still remains that as a historical document the honor belongs to Washington.

Postal Savings Bank Service.

EXTENSION OF REMARKS
OF
HON. WILLIAM M. CALDER,
OF NEW YORK.

IN THE HOUSE OF REPRESENTATIVES,

Saturday, February 20, 1915,

On the bill (H. R. 21328) making appropriations for the support of the Military Academy for the fiscal year ending June 30, 1916, and for other purposes.

Mr. CALDER. Mr. Speaker, I shall take advantage of the courtesy of the House in extending my remarks by printing a memorial prepared by Mr. Charles Frederick Adams, of New York City, on H. R. 13769, a bill introduced by me in the House during this Congress. This measure was formulated by Mr. Adams and a number of other gentlemen who believe its enactment would be to the advantage of the American people. It can not be acted on at this session, but I sincerely trust in the next Congress it may have the serious attention of the House and the Senate.

A memorial to the Congress of the United States, introduced in the House by the Hon. WILLIAM M. CALDER, of New York (Republican), and in the Senate by the Hon. ROBERT L. OWEN, of Oklahoma (Democrat).

There is now pending in the Congress of the United States the following measure (H. R. 13769, S. 3554, referred to the Committee on Post Offices and Post Roads):

"A bill to authorize the acceptance and administration of savings by the postal savings bank service of the Post Office Department for crescent life annuities.

"*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That every post-office savings bank of the United States shall accept from any citizen of the United States offering the same (and who shall have been duly enrolled as a participant in the people's pension system hereby established) 'dues' payments of one or more dollars each: *Provided, however* (in order that payments so made during a given calendar year may share in the dividend for such year on equal terms with dues payments made during calendar years preceding that one), That with each dollar so paid as 'dues' there shall also be paid in a 'premium contribution' to the dividend fund of the current year amounting to 1 cent on each dollar paid as dues during the first quarter of such year; to 2 cents on each dollar of dues paid during the second quarter of such year; to 3 cents on each dollar of dues paid during the third quarter of such year; and, finally, to 4 cents on each dollar of dues paid during the fourth quarter of such year.

"SEC. 2. That all the dues payments so received (through the several postal savings banks), together with all other investable values lawfully obtained for the purpose, shall constitute a perpetual people's pension fund the principal of which shall be kept invested (as nearly continuously as practicable) in presumably safe, income-yielding assets (including, on occasion, bonds or obligations of the United States yielding a net income of not less than 4 per cent per annum).

"SEC. 3. That a dividend fund shall be accumulated during each calendar year by applying thereto all the net income received during such year from the assets of the people's pension fund, and also all the additional cents received with 'dues' payments during the year as 'premium contributions' to such dividend fund.

"SEC. 4. That on or as of the 31st day of December in each and every year the total amount then constituting the dividend fund for such year shall be apportioned as a 'cash dividend' among the then living participants in the people's pension system, who shall have paid during the calendar year in question one or more dollars as dues (together with the corresponding 'premium contribution' to the dividend fund); such apportionment among such qualified living participants to be pro rata to their respective 'bases of participation,' and each participant's 'basis,' for this purpose, being deemed to consist of the sum of the following two items:

"First. The total amount theretofore (at any time) paid in by such annuitant as 'dues';

"Second. The total amount of 'increment' credited to such 'basis' under the following rule: On or as of the 31st day of December of each calendar year there shall be credited to the 'basis' of each living annuitant who shall have paid dues that year (as 'increment' permanently added to such 'basis') such annuitant's proportion (ascertained as hereinbelow specified) of the 'basis' of any annuitant born in the same calendar year as the participant in question who shall have died during the year or who, during seven consecutive years immediately preceding, shall have wholly failed or omitted to pay any dues at all; such apportionment of 'increment' among the annuitants entitled to share therein to be pro rata to the amounts theretofore paid by them, respectively, as dues."

The practical working of the "tontine-annuity" system thus provided for may be summarized as follows:

On the last day of each calendar year each living annuitant who has paid "dues" that year shares in the annual dividend, his or her share increasing as time goes on, through his or her inheriting, on the "tontine" principle, the income of those of the same age (born in the same year) who have died (or who for seven consecutive years have paid no dues at all). The last survivor of each such "birth-year class" draws during the rest of his or her life the entire income of the entire class. After such "last survivor's" death the income in question (the income that is produced by that part of the "people's pension fund," which consists of the "dues" paid in during the participation by all the former annuitants belonging to the particular lapsed "birth-year class" in question) goes annually "forever" to the entire body of participants in the system at the time being, irrespective of age. Every "birth-year class" must thus "lapse" sooner or later, since the persons born in the given calendar year who alone can be members of such class are not "infinitely" numerous. In the nature of things, indeed, one class will lapse each year on the average, which means obviously that by the operation of the system there will go on a steady and unending accumulation within the so-called people's pension fund of an ever-growing body of assets (consisting of the invested "dues" left in the fund by deceased annuitants of "birth-year classes," every member of which has died), of which assets the income is no longer payable to the original contributors of the principal, but constitutes for the entire body of participants living at a given time extra income over and above the income produced by the "dues" they themselves have paid in to date. In this way the rate of "dividend" upon the dues investments of a participant tends to increase by the occurrence of deaths (or abstentions). The possible increase in "tontine" annuities, such as those purchasable by these "dollar" dues, depends on the number of participants and the dues they pay, and may be indefinitely great. In one French "tontine," the encyclopædias tell us, "the solitary (last) survivor was a widow, one Charlotte Barbier, who died in her ninety-sixth year. At that time" (and in each of seven years preceding her death) "she drew an annual income of 73,000 livres" (more than $14,000) "in return for a total subscription of 300 livres" (only about $60 in all). Moreover, this was only the climax of the matter, since that ultimate income was arrived at by gradual steps, and during many years, before the one in which she first received "73,000 livres," she received annual amounts which, though smaller than the culminating one (of $14,000), were, respectively, equal to many times her total investment. And while there could be only one "last" survivor in any one "birth-year class," and therefore only one person who would achieve the maximum gain by "tontine inheritance," others would, in varying degrees, survive to inherit more or less important amounts of extra income. Those who died would no longer need "income"; all who continued to need income, by continuing to live, would correspondingly "survive" and incidentally inherit additional income (supplementing the income from their own "dues") about in the degree in which they advanced into the later years of life.

The system would thus, within each "birth-year class," operate most effectively as an "old-age pension" system, without burdening the taxes, and purely by the voluntary cooperation of the participants, who would thus, in effect, achieve a very real "mutual assurance" against the destitution of the "hand-to-mouth" condition.

The essence of the system obviously is the so-called "tontine annuity" contract, which the courts have held to be "in principle" identical with an "agreement to make mutual wills, which the courts have sustained as a good contract, and founded upon a good consideration." (N. Y. Supreme Court, appellate division, first department, in case of Scruggs *v.* Cotterill, citing N. Y. Ct. of Appeals, 155 N. Y., 566, and other authorities.) In point of fact, the basis of the annuity system authorized by the Calder-Owen bill is precisely an agreement between such citizens as shall voluntarily participate "to make mutual wills" (in legal effect) in one another's favor as to the savings paid in by them, respectively, as "dues" in such wise that on the death (actual or conclusively presumed after seven years of nonparticipation) of any

annuitant the income of the savings then standing to the credit of such decedent (as his "basis of participation") becomes payable each year, primarily to the living annuitants of the same "birth-year class," so long as any such "connatus" of that year survives, and, ultimately, after the death of the last survivor of the birth-year class, to all the participants living at the time being, irrespective of classes, "forever." (The agreement of each to this effect is deemed a "good consideration" for the similar agreement of each of the others.)

The history of numerous so-called "tontines," long past or more recent, very clearly proves that this sort of "agreement to make mutual wills" (as to the amounts invested in such annuities) has always proved exceedingly popular as an investment. So great has been its popularity, even under unpromising conditions as to terms, management, and irresponsibility of promoters, that historians and financial writers have felt called upon to account for it by psychological considerations; by suggestions that it has "to a degree" the attractiveness of a "lottery." But though it is true that the attractiveness of tontines is in a sense analogous to that of lotteries (and would no doubt equal it in intensity but for the greater delay in the attainment of results), there is a radical distinction between lotteries and tontines which redeems the latter from that taint of illegitimacy which brands the former. That distinction is this, that in the tontine contract the contingency upon which the results depend is not an arbitrary chance or "lot" having no relevancy to or bearing on those results, but, on the contrary, is a natural phenomenon (death), of which only the date is "contingent," and whose occurrence—ultimately inevitable—must in any event involve a cessation of the receipt of income by the decedent concerned. (In view of its general acceptability, Alexander Hamilton recommended the tontine scheme to Congress as a financial recourse in his famous report on the organization of our national finances.)

It is beyond all doubt that very, very many people—more and more as the thing went on—would willingly—nay, eagerly—invest relatively small sums, on a "tontine" basis, for the sake of the contingent right to "inherit," by survivorship, the income of overwhelmingly larger funds; men not already dying nor in great suffering, being (as Lorenzo Tonti pointed out to Cardinal Mazarin) instinctively optimistic as to their own longevity, and willing to "stake" even heavily upon it. As the poet puts it, "Man feels 'all men are mortal,' save himself." Many of the "tontine" enterprises of the past were promoted under auspices not in the least reassuring as to responsibility, scientific actuarial methods, or even freedom from actual fraud; but none the less they proved popular, from the inherent attractiveness of the "potential inheritance" inducement. On the other hand, in view of the guaranties of permanence, safety, and rapid and great growth which its administration by the Government of this great Nation would afford to the system provided for by the Calder-Owen bill, that system's inherent popularity would (a fortiori) have full scope and effect. Nothing, therefore, can be more certain than that "participation" would soon become a practically universal "fashion" among all permitted to participate; that is to say, the entire body of our citizenship. The minimum "annual dues," the sole necessary cost of participation, being but $1 per annum per person (so that for as little as $10 a year a family of 10 could all be kept in good standing as active and regular participants); and, on the other hand, the possibilities of income growth by tontine inheritance for each participant being at least as great as the total incomes of the total aggregate of "dues" paid in by the entire "birth-year class," it is simply inconceivable that any citizen would consent to leave himself or his child, or any other dependent dear one, out of an institution in which at no greater necessary expense than $1 a year each, each could be kept receiving annually at least the income of his own "dues" in any event, while having, besides, a contingent right to the immense potentialities of income inheritance dependent upon survivorship.

Unquestionably, larger and larger funds would be paid in as "dues" by the successive "birth-year classes" as time went on, and each such class fund would, sooner or later, "lapse," leaving its annual income to be received by the body of participants for the time being, in addition to the income receivable from these participants' own investments. There would thus accumulate, persistently and more and more rapidly, a "people's inheritance," in the income of which all could entitle themselves to share upon terms with which all could comply. This would mean nothing less than the peaceful and legitimate diffusion, more and more widely through the community, of the "beneficial" ownership of this ever-growing fund, and consequently interest or rent, or both, would be attainable by practically everyone, as incomes supplementing—or, on occasion, taking the place of—the (possible) "wages" income on which the vast majority now rely exclusively, though as a sole reliance it is disastrously precarious and inadequate.

That such a system should in fact be established and kept in operation is, surely, a "consummation devoutly to be wished." The enactment of the Calder-Owen bill would make practicable and insure its establishment and continuingly successful operation by affording it guaranties of safety, permanence, and general acceptability, which, under private auspices, it never could secure. To do this, as proposed, would be but to utilize the postal savings banks already established (and which undoubtedly "have come to stay") as custodians and administrators not only of the people's savings "deposits," but also of the savings which the people may choose to pay in, not as withdrawable "deposits," but as the price or premium of life annuities of the sort described. It is now admittedly a perfectly legitimate and expedient "governmental function" to facilitate, safeguard, and induce thrift—on the part of the many for whom it must else be difficult and discouragingly precarious and unpromising—by giving to the "savings" invited that "insurance" against loss by fraud or bad management which official administration under the responsibility of a great National Government would provide for them. The European nations whose example we followed in establishing our postal savings banks permit theirs to issue life annuities as well as to accept "deposits." An incidental but very practical feature of great "financial" significance is this, that in the moneys constituting this perpetual and ever-growing "people's pension fund" the Government would have constantly in its hands, without the expense and trouble of periodical repayments and reborrowings of principal, funds pro tanto available for such "loans" as it felt called upon to use; in other words, a most convenient and economical "market for its bonds."

In such a perpetual and constantly growing "people's pension fund," the beneficent effects of whose operation would soon (and irrevocably) establish it in the interest and affections of the people as an institution which they "would never willingly let die," the statesmen who shall have identified their names as those of its founders will have built for themselves an imperishable monument and won the glory of great contributors "to the glory of God and the relief of man's estate."

CHARLES FREDERICK ADAMS.

Southern Pacific Attempts Secretly to Reach Chief Justice of the United States.

EXTENSION OF REMARKS
OF
HON. A. W. LAFFERTY,
OF OREGON,
IN THE HOUSE OF REPRESENTATIVES,

Saturday, February 20, 1915.

Mr. LAFFERTY. Mr. Speaker, I desire to call attention to Congress and of the country to an attempt which has been made within the last 10 days by William F. Herrin, chief counsel for the Southern Pacific Railroad, to reach the Chief Justice of the United States and to influence that high official to delay until October next the date for the argument of an important case in which the Southern Pacific Railroad is defendant.

That this action was taken secretly and without notice to the cross-complainants in the case will be shown by the telegrams of Mr. Herrin to his Washington counsel, which telegrams I shall presently read.

The case in question involves 2,300,000 acres of land in Oregon granted by Congress to the railroad company with the provision that the railroad company would sell the lands "to actual settlers, in tracts of not more than 160 acres to any one settler, and for prices not exceeding $2.50 per acre." The land is worth on an average $25 per acre, or $50,000,000. That is the stake involved in Mr. Herrin's titanic struggle to evade the law of Congress. These lands would make 15,000 homes of 160 acres each, or 60,000 homes of 40 acres each.

This case was started in the Federal court in Portland, Oreg., 8 years ago by 65 actual settlers who went on the land, built their houses, moved in, and after becoming actual bona fide settlers and tendering to the railroad company the maximum amount it was entitled to receive for the land under the act of Congress, and demanding deeds which were refused, brought the present suit.

One year later the Government intervened in the suits which these settlers had started and was permitted to file a bill asking that all the lands involved be forfeited to the United States, including the claims the settlers had sued for. The court consolidated the settlers' cases with that of the Government and ordered that the settlers refile their complaints in the form of a cross bill.

In this way the settlers have been hampered and held back by the snaillike proceeding of the Department of Justice. It took seven years for the case to reach the circuit court of appeals in San Francsico, where it was argued last May. On June 1, 1914, at the conclusion of the argument, the circuit court of appeals announced that in order to save time it would immediately certify the case to the Supreme Court without itself rendering any decision whatever.

In that way the case reached the Supreme Court here last fall on certificate. The Solicitor General immediately moved the court to order the entire record sent up from San Francisco, which order the Supreme Court made the 1st day of this month. The court on that day recessed until February 23, which will be next Tuesday.

It was understood by all parties that on February 23 the Solicitor General will present to the court under the rules a printed motion, which will have to be duly served on all parties, and which motion will ask the court to advance the case on the docket for argument. If the court shall so advance the case for argument at this term it will necessarily have to set it down for hearing sometime in April, as no arguments will be heard at a later date, although the court will not adjourn until June. Then the court will reconvene in October for next year's term.

Immediately after the court sustained the motion to have the entire record sent up, which order was entered February 1, Mr. Herrin became active in his effort to put the case over till October. And in these activities Mr. Herrin did not notify either the settlers or their counsel, but attempted secretly to reach the Chief Justice of the United States in the privacy of his home in this city.

That this is a grave and serious charge I fully realize. I would not make it if I did not have the documentary proof of what I say. I realize that there are cases where counsel may lawfully make ex parte applications to a justice of the Supreme Court, but such ex parte representations may not be lawfully made upon a motion to advance a case for argument upon the

docket of the Supreme Court. In such a case the rules require that all arguments for or against the motion must be printed in brief form and after first being duly served on all parties in the case may be brought to the attention of the court in open court.

Mr. Herrin wired his Washington, D. C., counsel to urge certain alleged reasons to the Chief Justice why the case should not be advanced for hearing in April. Mr. Herrin directed his Washington counsel to make the representation "either oral or written to the Chief Justice," and closed with these words:

You should present to Chief Justice, as soon as possible in advance of reassembling of court, practical impossibility of our presenting case earlier than October next, promptly advising me.

WM. F. HERRIN.

As to whether Mr. Herrin's Washington counsel has had the effrontery to invade the private home of the Chief Justice upon any such unprofessional and unlawful mission, I do not know. But I do know that Mr. Hoehling called up the clerk of the Supreme Court by telephone, and, after some conversation, the purport of which I do not know, Mr. Hoehling mailed Mr. Herrin's telegrams to the clerk of the court. If Mr. Hoehling asked the clerk of the court to carry these representations to the Chief Justice he magnified the offense by making a request upon an officer of court to violate the rules of the court. As stated, all arguments for or against a motion to advance must, under the rules of the court, be served upon all parties in interest.

It was by the merest accident that I learned that these telegrams had been mailed to the clerk of the court. Had it not been for the fact that I was here in Washington and frequently around the office of the clerk of the court I would never have heard of it. Had I been in Portland, Oreg., my home, this case might have been delayed till October on the false representations of Mr. Herrin without my ever having known that they were made.

All lawyers will understand that the mere mailing of the telegrams to the clerk of the court was no notice to anybody that such representations had been made or would be made to the Chief Justice. It does not happen one time in ten thousand that opposing counsel see the private correspondence that their adversaries may have with the clerk of the court. Usually that correspondence is never inspected or even thought of by opposing counsel. Only the printed briefs are mutually served and read.

Very evidently Mr. Hoehling intended that the copies of the telegrams which he mailed to the clerk of the court should be presented to the Chief Justice for his consideration, for two of these copies bear notations made by Mr. Hoehling that they were "read over the telephone" to Mr. Hughes, who is an assistant in the office of the Solicitor General. That notation could only have been made for the purpose of satisfying some one that at least a semblance of service had been made upon the Solicitor General. But it will be noted that Mr. Hoehling does not even claim that the last telegram from Mr. Herrin, which is the most insistent, was even "read over the telephone" to Mr. Hughes, or to anyone else.

Mr. Hoehling's letter to the clerk of the court and a telegram from ex-Senator John C. Spooner and the two telegrams from Mr. Herrin will now be read, which three telegrams constitute the only documents transmitted by Mr. Hoehling with his letter.

A. A. HOEHLING, Jr.,
ATTORNEY AND COUNSELOR AT LAW,
Washington, D. C., February 13, 1915.

JAMES D. MAHER,
Clerk Supreme Court, Washington, D. C.

MY DEAR MR. MAHER: In re Oregon & California Railroad Co., appellants, *v.* United States, No. 679, October term, 1914, Supreme Court of the United States.

Referring to our conversation over the telephone to-day, and for your better information, I take the liberty of handing you herewith copies of telegrams received by me from Senator Spooner and from Judge Herrin, which will sufficiently explain themselves.

Very truly, yours,

A. A. HOEHLING, Jr.

Inclosures.

—

Read over telephone by Mr. Hoehling to Mr. Hughes, February 11, 1915:

[Telegram.]

NEW YORK, N. Y., *February 10, 1915.*

A. A. HOEHLING, Jr., Esq., *Washington, D. C.:*

Letter received. No objection to advancing case, but sincerely hope it will not be assigned for argument prior to May 1. Greatly prefer early in October term.

JOHN C. SPOONER.

—

Read over telephone by Mr. Hoehling to Mr. Hughes:

[Telegram.]

SAN FRANCISCO, CAL., *February 10, 1915.*

A. A. HOEHLING, Jr., Esq., *Washington, D. C.:*

Your telegram 9th and 10th. Owing to the fact that testimony Central Pacific merger case will begin here March 1, it will be impossible for us to get ready for argument Oregon & California case by April 5 or to prepare our briefs in due time for filing before that date or any later date in April. Arrange with Solicitor General for advancement hearing to first day of October term. Wire whether Solicitor General consents to arrangement. I will send on 29 additional sets of record required by clerk Supreme Court. Unless there is objection thereto, will ship them as freight.

WILLIAM F. HERRIN.

—

(No statement that it was read "over the telephone" to "Mr. Hughes" or to anyone else.)

[Telegram.]

SAN FRANCISCO, CAL., *February 12, 1915.*

A. A. HOEHLING, Jr., *Washington, D. C.:*

Your message 11th. It will be impossible for us to be ready for April or earlier than October next, and if court should set case earlier than October next we should be driven to an application to continue hearing to October. You can not represent this too earnestly to Solicitor General. Please see him at once and endeavor to secure his cooperation in a representation to the court before it reassembles on the 23d instant that in view of importance and magnitude of case, parties will not be prepared to present it earlier than October next. If Solicitor General is unwilling to cooperate actively in this behalf, please secure his concurrence to a statement by you in your own representation, either oral or written, to the Chief Justice that Department of Justice will not object if case is set down for hearing for October. In other words, with or without the active cooperation of Solicitor General, you should present to Chief Justice as soon as possible in advance of reassembling of court practical impossibility of our presenting case earlier than October next, promptly advising me.

WM. F. HERRIN.

If the foregoing telegrams had been served upon the Solicitor General, that would not have made it lawful or professional to then secretly present them to the chief justice "in advance of the reassembling of the court," for the reason that the Solicitor General represents the United States alone and in no way represents the settlers on the land, who are not only parties to the suit but who actually started the suit. Mr. Herrin deliberately sought to reach the Chief Justice secretly, so far as these settlers were concerned, well knowing that the settlers were the only parties to the suit who have ever been insistent that the case go forward with reasonable speed. Mr. Herrin thought that if he could reach the court in this way he would be able to accomplish his design, and that no settler out on the land would ever be any wiser.

I present these facts to Congress in order that the bar of the whole country may know what liberties Mr. Herrin and his kind are willing to take with the courts of the United States, and without any notice to opposing counsel, so long as the courts will stand for it. It was not so very long ago that a judge of the highest court in the State of Washington resigned under charges, and admitted that his opinion in a railroad case was written by the counsel for the railroad. Only two years ago a Federal judge at Seattle resigned while under investigation by a committee of this House. I desire simply to warn our judiciary, as well as our people at large, that the invisible Government is at work just as actively now as ever before, and all officers and all citizens should know the facts.

The William F. Herrin to whom I have referred in these remarks has been a power on the Pacific coast for many years. He has controlled elections of judges, governors, and other State officers, and he has had a powerful influence in the appointment of Federal judges. He represents the money power of the United States on the Pacific coast. His right-hand man in Oregon is William D. Fenton, whom he has had employed for years as Oregon counsel for the Southern Pacific and as general adviser on Oregon matters. Fenton has grown immensely rich in this work and is now said to be the wealthiest lawyer at the Portland bar. Last August Fenton wrote a long editorial, which was printed in the Portland Oregonian, not as a communication but in the guise of an ordinary editorial, stating that I ought to be retired because I was not on the job. I wonder if Fenton will think I am on the job now?

The Oregonian represents Herrin and Fenton in Oregon, and the other Portland papers are but very little better. Fenton and Pittock—the latter owner of the Oregonian—are joint directors of the new Northwestern National Bank.

When the Southern Pacific a number of years ago, through Mills, its land agent, bought the Sacramento Union for use in controlling California politics, the company came to Portland and selected Alfred Holman to edit the Union. Holman was an editorial writer on the Oregonian at the time and had showed his fitness for the job in California. Later the Southern Pacific bought the San Francisco Argonaut, one of the most influential weeklies in the United States, and put Mr. Holman in charge of it.

During the past few years the special interests have started in Portland a weekly along the same lines as the Argonaut, and have put one Hugh Hume in charge of it. The paper conceals its real source of income, like the Argonaut, and seeks to enter the best homes. Hume came to Portland from San Francisco. He was born in Scotland. He rails against Senator HARRY

LANE. He rails against me. He is serving the interests, and he is being paid by them.

When I first entered Congress I was approached by two men, one of whom was a former Member of the House, whose name I will gladly give if any gentleman present will so request, and the other was James Y. Iddings, of San Francisco; and they asked me to aid them in certain legal matters connected with a certain electric road which they said they were going to build in Oregon. The road was to run from Coos Bay to Grants Pass, so they said, and was to be called the "Coos Bay & Eastern Electric Co." I declined to so serve, and in less than two weeks a newspaper campaign was started against me that has, temporarily at least, destroyed my standing with many good citizens in my district and which resulted in my defeat for reelection last year.

The Oregonian, the Evening Telegram—at that time owned by the Oregonian—the Argonaut, and the Spectator were the most active in that campaign against me. I give Mr. Herrin full credit for having temporarily retired me to private life. I believe in giving the devil his due, but I wish to warn him that the fight has now just started, and that I shall repeat on the stump all that I have said here, and more.

No burglar ever showed more brazen effrontery in robbing a house than Mr. Herrin has displayed in his recent attempt to reach the Chief Justice of the United States without notice to certain parties to the record in the land-grant case.

In one of his telegrams, heretofore read in full, Mr. Herrin makes this remarkable statement:

If Solicitor General is unwilling to cooperate actively in this behalf, please secure his concurrence to a statement by you in your own representation, either oral or written, to the Chief Justice that Department of Justice will not object if case is set down for hearing for October.

What is the meaning of this language? It means that Mr. Herrin reflected upon the integrity of the Solicitor General of the United States by asking that he be invited to become a party to the secret presentation to the Chief Justice in advance of the reassembling of the court certain alleged reasons why the argument of the case should go over to October. Did Mr. Herrin expect the Solicitor General to acquiesce in any such unlawful and unprofessional arrangement which contemplated important representations to the Chief Justice without any notice to the settlers on the land and in violation of the rules of the court? That is just what Mr. Herrin contemplated, and his hardened conscience did not even suggest to him that it was wrong. For a lifetime Mr. Herrin as the political boss of the Pacific coast has done that sort of thing, and as the representative of Wall Street, and he imagined he could do the same thing with impunity under the Dome of this Capitol.

The flimsy plea of Mr. Herrin that he can not argue the case here in April because the "taking of testimony in the Central Pacific merger case begins March 1" is the height of absurdity. Mr. Herrin represents the consolidated railroads of the Harriman lines in the West. He pleads as a reason for delay of this important case that his lines have been so numerously charged with violations of the law of the United States that he must be elsewhere. And if Mr. Herrin were more anxious to continue the taking of testimony in the Central Pacific merger case, he would there urge that he could not go ahead till fall, because he had to be in the Supreme Court in this case. In other words, Mr. Herrin and all other railroad bosses are in the habit of urging this hackneyed argument for continuances just as their own convenience dictates.

All courts know that it is the duty of a railroad company to employ sufficient attorneys to try all their cases on time, and the courts should enforce that duty. Mr. Herrin has known since June 1, 1914, that this case was to come up for argument here in the spring of this year, and Mr. Herrin is ready. But if he can flimflam the court and the public by getting another year's delay, he is not the man who will feel any qualms of conscience in doing so.

Mr. Herrin makes a plaything and a mockery of the court by suggesting in one of the telegrams that he will send up the 29 additional sets of the record required by the clerk of the Supreme Court "as freight." If the Southern Pacific was sending a horse or a cow to Washington, the animal would come by express; but when it comes to the record in a $50,000,000 land-grant case, Mr. Herrin has the unadulterated gall to propose that he will ship them "as freight." Mr. Herrin's only object, of course, is delay, and not a financial saving by sending records of this importance "as freight."

Mr. Herrin says in his telegrams that he can not prepare his briefs in time for argument in April. This case was argued and briefed one year ago in San Francisco upon the identical record that is to be presented here, and it would not require a week for Mr. Herrin to reprint his briefs if he wanted to. He simply wants delay. He is as ready now as he ever will be, and he knows it, and one year ago he had Mr. Fenton tell the people of Oregon through the Oregonian that his company was anxious to hurry the case, and that it was the Government that was responsible for the long delay. He was lying then, and he is lying now.

Meantime men, women, and children in Oregon are suffering from poverty and lack of food who are unlawfully kept from these lands. Whose convenience should appeal to the court the stronger—these men, women, and children for whom Congress has sought to legislate, or Mr. Herrin, who desires to take a little testimony, as he claims, in the Central Pacific merger case, beginning March 1?

The case has now dragged for eight years. Its snaillike progress has become a scandal in the eyes of many conservative people. Unlawful influences have been brought to bear to cause this long delay.

The Government is now ready. The settlers are demanding an early hearing. Why should the rot and piffle of Mr. Herrin, which he dares not present to the court in the open, after due service upon all counsel of record, be regarded for a moment as an excuse to put over till October the argument of this case? In October they would have other excuses for further delays if they thought the court would listen to them for a moment.

In giving these facts to Congress and to the people who elected me to this House I am but performing my simple duty. It has been a pleasure to do so. [Applause.]

The Late Representative Martin, of New Jersey.

EXTENSION OF REMARKS

OF

HON. J. THOMPSON BAKER,

OF NEW JERSEY,

IN THE HOUSE OF REPRESENTATIVES,

Sunday, February 14, 1915,

On House resolution 735, as follows:

"*Resolved,* That the business of the House be now suspended that opportunity may be given for tributes to the memory of Hon. LEWIS J. MARTIN, late a Member of this House from the State of New Jersey.

"*Resolved,* That as a particular mark of respect to the memory of the deceased and in recognition of his distinguished public career the House, at the conclusion of these exercises, shall stand adjourned.

"*Resolved,* That the Clerk communicate these resolutions to the Senate.

"*Resolved,* That the Clerk send a copy of these resolutions to the family of the deceased."

Mr. BAKER. Mr. Speaker, in writing of old age and friendship, Cicero said there are four reasons why old age should seem wretched, and that one of the reasons why it is so regarded is that it is not far distant from death.

Judge MARTIN did not come within the purview of those alluded to in this, and I advert to what the great Roman said only because Judge MARTIN did not suffer on account of age, although he lived many years, but he had no occasion to consider that distress among the multitude of anxieties that occupy the minds of men.

Plato discusses the subject of dissolution so philosophically as to remove the anguish which disturbs most men, but he wrote as one contemplating its near presence.

So did Socrates talk of it with a complacency that would at least mollify the distraction that universally attends the impending fact.

Judge MARTIN had the advantage of meeting death without premonition, and consequently without the pangs that are said to attend the contemplation of so tremendous an event.

The Holy Scriptures teach us to pray that we may not suffer sudden death, meaning, doubtless, that we might be exempt from the precipitation of so great a change without opportunity to reflect and to attune ourselves to it.

I once heard a very learned divine discourse on the subject, and, as I remember his ruminations upon the supreme event which comes to us all, he expressed the conviction that upon dissolution the soul is thrilled with ecstacy on account of its escape from the coil of the body, and that it is free from regret, save sympathy for those who are still afflicted with the weight and restraint of corporal life and detention.

The precipitancy that attended the death of our friend assures to us a feeling that he had the indescribable advantage of exemption from the unhappiness of thinking of the great change as being near with all that it involves.

He had the joy of swift release from the operations of mortal life. Can we not then regard his taking off, in the manner in which he left us, as a special dispensation in his favor?

Ship Purchase Bill—How the Tariff Destroyed Our Merchant Shipping.

EXTENSION OF REMARKS

OF

HON. HENRY GEORGE, JR.,

OF NEW YORK,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, February 16, 1915.

Mr. GEORGE. Mr. Speaker, as appropriate to my vote in support of the ship purchase bill, I offer an extract from chapter 18 of my father's book, Protection or Free Trade, revealing the shrinkage of shipbuilding in the United States.

Thirty years ago (1855) shipbuilding had reached such a pitch of excellence in this country that we built not only for ourselves, but for other nations. American ships were the fastest sailers, the largest carriers, and everywhere got the quickest dispatch and the highest freights. The registered tonnage of the United States almost equaled that of Great Britain, and a few years promised to give us the unquestionable supremacy of the ocean.

The abolition of the more important British protective duties in 1846 was followed in 1854 by the repeal of the navigation laws, and from thenceforth not only were British subjects free to buy or build ships wherever they pleased, but the coasting trade of the British Isles was thrown open to foreigners. Dire were the predictions of British protectionists as to the utter ruin that was thus prepared for British commerce. The Yankees were to sweep the ocean and "half-starved Swedes and Norwegians" were to drive the "ruddy, beef-eating English tar" from his own seas and channels.

While one great commercial nation thus abandoned protection, the other redoubled it. The breaking out of our Civil War was the golden opportunity of protection, and the unselfish ardor of a people ready to make any sacrifice to prevent the dismemberment of their country was taken advantage of to pile protective taxes upon them. The ravages of Confederate cruisers and the consequent high rate of insurance on American ships would under any circumstances have diminished our deep-sea commerce; yet this effect was only temporary, and but for our protective policy we should at the end of the war have quickly resumed our place in the carrying trade of the world and moved forward to the lead with more vigor than ever.

But crushed by a policy which prevents Americans from building and forbids them to buy ships our commerce ever since the war has steadily shrunk until American ships, which, when we were a nation of 25,000,000, plowed every sea of the globe, are now, when we number nearly 60,000,000, seldom seen on blue water. In Liverpool docks, where once it seemed as if every other vessel was American, you must search the forests of masts to find one. In San Francisco Bay you can count English ship, and English ship, and English ship before you come to an American, while five-sixths of the foreign commerce of New York is carried on in foreign bottoms. Once no American dreamed of crossing the Atlantic save on an American ship; to-day no one thinks of taking one. It is the French and the Germans who compete with the British in carrying Americans to Europe and bringing them back. Once our ships were the finest on the ocean. To-day there is not a first-class ocean carrier under the American flag, and but for the fact that foreign vessels are absolutely prohibited from carrying between American ports, shipbuilding, in which we once led the world, would now be with us a lost art. As it is, we have utterly lost our place. When I was a boy we confidently believed that American ships could outsail anything that floated, and in the event of war with a commercial nation we knew that every sea of the globe would swarm with swift American privateers. To-day Great Britain could take from those greyhounds of the sea which American travel and trade support enough fleet ships to snap up any vessel that ventured out of an American port.

I do not complain of the inefficiency of our Navy. The maintenance of a navy in time of peace is unworthy of the dignity of the great Republic and of the place she should aspire to among the nations, and to my mind the hundreds of millions that during the last 20 years we have spent upon our Navy has been worse than wasted. But I do complain of the decadence in our ability to build ships. Our misfortune is that we lack the swift merchant fleet, the great foundries and shipyards, the skilled engineers and seamen and mechanics, in which, and not in navies, true power upon the seas consists. A people in whose veins runs the blood of vikings have been driven off the ocean by—themselves.

Of course, the selfish interests that profit, or imagine they profit, by the policy which has swept the American flag from the ocean as no foreign enemy could have done, ascribe this effect to every cause but the right one. They say, for instance, that we can not compete with other Nations in ocean commerce, because they have an advantage in lower wages and cheaper capital, in willful disregard of the fact that when the difference in wages and interest between the two sides of the Atlantic was far greater than now we not only carried for ourselves but for other Nations, and were rapidly rising to the position of the greatest of ocean carriers. The truth is, that if wages are higher with us this is really to our advantage, while not only can capital now be had as cheaply in New York as in London, but American capital is actually being used to run vessels under foreign flags, because of the taxes which make it unprofitable to build or run American vessels.

De Tocqueville, 50 years ago, was struck with the fact that nine-tenths of the commerce between the United States and Europe and three-fourths of the commerce of the New World with Europe was carried in American ships; that these ships filled the docks of Havre and Liverpool, while but a few English and French vessels were to be seen at New York. This, he saw, could only be explained by the fact that "vessels of the United States can cross the seas at a cheaper rate than any other vessels in the world. But," he continues, "it is difficult to say for what reason the American can trade at a lower rate than other Nations; and one is at first sight led to attribute this circumstance to the physical or natural advantages which are within their reach; but this supposition is erroneous. The American vessels cost almost as much as our own; they are not better built, and they generally last for a shorter time, while the pay of the American sailor is more considerable than the pay on board European ships. I am of opinion that the true cause of their superiority must not be sought for in physical advantages, but that it is wholly attributable to their moral and intellectual qualities.

"* * * The European sailor navigates with prudence; he only sets sail when the weather is favorable; if an unforeseen accident befalls him, he puts into port; at night he furls a portion of his canvas; and when the whitening billows intimate the vicinity of land, he checks his way and takes an observation of the sea. But the American neglects these precautions, and braves these dangers. He weighs anchor in the midst of tempestuous gales; by night and by day he spreads his sails to the wind; he repairs as he goes along such damages as his vessel may have sustained from the storm; and when at last he closes the term of his voyage he darts onward to the shore as if he already descried a port. The Americans are often shipwrecked, but no trader crosses the sea so rapidly, and, as they perform the same distance in a shorter time, they can perform it at a cheaper rate.

"I can not better explain my meaning than by saying that the American affects a sort of heroism in his manner of trading, in which he follows not only a calculation of his gain, but an impulse of his nature."

What the observant Frenchman describes in somewhat extravagant language was a real advantage—an advantage that attached not merely to the sailing of ships, but to their designing, their building, and everything connected with them. And what gave this advantage was not anything in American nature that differed from other human nature, but the fact that higher wages and the resulting higher standard of comfort and better opportunities developed a greater power of adapting means to ends. In short, the secret of our success upon the ocean (as of all our other successes) lay in the very things that according to the exponents of protectionism now shut us out from the ocean. (By way of consolation for the manner in which protectionism has driven American ships from the ocean, Prof. Thompson [Political Economy, p. 216] says: "If there were no other reason for the policy that seeks to reduce foreign commerce to a minimum, a sufficient one would be found in its effect upon the human material it employs. Bentham thought the worst possible use that could be made of a man was to hang him; a worse still is to make a common sailor of him. The life and the manly character of the sailor has been so admired in song and prose, and the real excellences of individuals of the profession have been made so prominent that we forget what the mass of this class of men are and what representatives of our civilization and Christianity we send out to all lands in the tenants of the forecastle." There is some truth in this, but what there is is due to protectionism in its broader sense. There is no reason in the nature of his vocation why the sailor should not be as well fed, well paid, and well treated as intelligent and self-respecting as any mechanic. That he is not is at bottom due to the paternal interference of maritime law with the relations of employer and employed. The law does not specifically enforce contracts for services on shore, and for any breach of contract by an employee the employer has only a civil remedy. He can not restrain the employed of his liberty, coerce him by violence or duress, or should he quit work call on the law to bring him back, and thus the personal relations of employer and employed are left to the free play of mutual interest. For services requiring vigilance and sobriety, and where great loss or danger would result from a sudden refusal to go on with the work, the employer must look to the character of the men he employs and must so pay and treat them that there will be no danger of their wishing to leave him. But what on shore is thus left to the self-regulative principle of freedom is, as to services to be performed on shipboard, attempted to be regulated on the paternal principle of protectionism. Here the law steps in to compel the specific performance of contracts and not only gives the employer or his representative the right to restrain the employed of his personal liberty and by violence or duress to compel his performance of services he has contracted for, but if the employed leave the ship the law may be invoked to arrest, imprison, and force him back. The result has been on the one hand largely to destroy the incentive to proper treatment of their crews on the part of owners and masters of ships and on the other to degrade the character of seamen. Crews have been largely obtained by a system of virtual impressment or kidnapping, called in 'longshore vernacular "shanghaing," by which men are put on board ship when drunk, or even by force, for the sake of their advance wages or a bonus called "blood money," which the power of keeping the men on board and compelling them to work enables the shipowners safely to pay. The power that must be intrusted to the master of a ship, on whose skill and judgment depends the safety of all on board, is necessarily despotic; but while the abuse of this power has under a system which enables a brutal captain to get crews with as much or almost as much facility as a humane one been little checked by motives of self-interest, it has been stimulated by the degradation which such a system inevitably produces in the character of the crews. Various attempts have been made to remedy this state of things, but nothing can avail much that does not go to the root of the difficulty and leave the sailor, no matter what contract he may have signed or what advances have been paid to or for him, as free to quit a vessel as any mechanic on shore is free to quit his employment. Theoretically the law may guard the rights of one party to a contract as well as those of the other, but practically the poor and uninfluential are always at a disadvantage in appealing to the law. This is a vice which inheres in all forms of protectionism, from that of absolute monarchy to that of protective duties.)

Again, it is said that it is the substitution of steam for canvas and iron for wood that has led to the decay of American shipping. This is no more a reason for the decay of American shipping than is the substitution of the double top-sail yard for the single top-sail yard. River steamers were first developed here; it was an American steamship that first crossed from New York to Liverpool, and 30 years ago American steamships were making the "crack" passages. The same skill, the same energy, the same facility of adapting means to ends which enabled our mechanics to build wooden ships would have enabled them to continue to build ships, no matter what the change in material. With free trade we should not merely have kept abreast of the change from wood to iron, we should have led it. This we should have done even though not a pound of iron could have been produced on the whole continent. In the glorious days of American shipbuilding Donald McKay, of Boston, and William H. Webb, of New York, drew the materials for their white-winged racers from forests that were practically almost as far from those cities as they were from the Clyde, the Humber, or the Thames. Had our shipbuilders been as free as their English rivals to get their materials wherever they could buy them best and cheapest, they could as easily have built ships with iron brought from England

as they did build them with knees from Florida and planks from Maine and North Carolina and spars from Oregon. Ireland produces neither iron nor coal, but Belfast has become noted for iron shipbuilding, and iron can be carried across the Atlantic almost as cheaply as across the Irish Sea.

But so far from its being necessary to bring iron from Great Britain, our deposits of coal and iron are larger, better, and more easily worked than those of Great Britain, and before the Revolution we were actually exporting iron to that country. Had we never embraced the policy of protection, we should to-day have been the first of iron producers. The advantage that Great Britain has over us is simply that she has abandoned the repressive system of protection, while we have increased it. This difference in policy, while it has enabled the British producer to avail himself of the advantages of all the world, has handicapped the American producer and restricted him to the market of his own country. The ores of Spain and Africa which, for some purposes, it is necessary to mix with our own ores, have been burdened with a heavy duty; a heavy duty has enabled a great steel combination to keep steel at a monopoly price; a heavy duty on copper has enabled another combination to get a high price for American copper at home, while exporting it to Great Britain for a low price; and to encourage a single bunting factory the very ensign of an American ship has been subjected to a duty of 150 per cent. From keelson to truck, from the wire in her stays to the brass in her taffrail log, everything that goes to the building, the fitting, or the storing of a ship is burdened with heavy taxes. Even should she be repaired abroad she must pay taxes for it on her return home. Thus has protection strangled an industry in which with free trade we might still have led the world. And the injury we have done ourselves has been, in some degree at least, an injury to mankind. Who can doubt that ocean steamships would to-day have been swifter and better had American builders been free to compete with British builders?

Though our navigation laws, which forbid the carrying of a pound of freight or a single passenger from American port to American port on any other than an American-built vessel, obscure the effects of protection in our coasting trade, they are just as truly felt as in our ocean trade. The increased cost of building and running vessels has, especially as to steamers, operated to stunt the growth of our coasting trade, and to check by higher freights the development of other industries. And how restriction strengthens monopoly is seen in the manner in which the effect of protection upon our coastwise trade has been to make easier the extortions of railway syndicates. For instance, the Pacific Railway pool has for years paid the Pacific Mail Steamship Co. $85,000 a month to keep up its rates of fare and freight between New York and San Francisco. It would have been impossible for the railway ring thus to prevent competition had the trade between the Atlantic and Pacific been open to foreign vessels.

Conservation of Natural Resources.

EXTENSION OF REMARKS
OF
HON. JOSEPH HOWELL,
OF UTAH,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, February 23, 1915.

Mr. HOWELL. Mr. Speaker, in a recent interview at Ogden, Utah, with Hon. Franklin K. Lane, Secretary of the Interior, he is reported in the Salt Lake papers to have said:

"It seems to me that you people out here in Utah are overlooking some things which are decidedly favorable to the future upbuilding of the West and especially this State right here. There are now pending before Congress two bills which mean so much to this State, yet you people are not fighting for them; I never hear a word from you in favor of them. The first is the water-power bill, providing for the development of water-power rights on the public lands.

"Nothing is so important to Utah as the development of water power, and you know what an immense amount of water power is going to waste here. The bill means the investment of millions of dollars of outside capital. I know of one interest that is ready to invest $40,000,000 in western water-power development if this bill is passed.

FAVORS DEVELOPMENT.

"Under the present laws, leases of water-power rights on public lands are revocable by the Secretary of the Interior. Under the bill I have introduced it is possible to develop these sites, the rights to which may be transferred to city or State after 50 years. There is no reason why all this water should go to waste. With the power that can be developed the water can be raised from the rivers for irrigation. You know what greater irrigation means for Utah.

"The attitude of the present water-power interests in this section seems to be that further development of the wonderful resources here will only have the effect of reducing the profit on the present comparatively small investments. The West should be developed and is entitled to this legislation.

"The other bill is the leasing measure. Nobody knows but that there may be oil deposits in Utah. California did not have any more idea concerning oil 10 years ago than you people have at the present time. Yet look what California is producing annually in the way of oil. You have large deposits of phosphate in southern Utah that are at the present time impossible of development. Under the leasing bill it would be possible for the deposits to be taken up in large tracts and the product successfully marketed.

"But I hear nothing from the Utah people concerning either of these bills. You people have no real excuse to offer if you do not profit by these opportunities and induce outside capital to come in and help develop your State, for you elect your Representatives to Congress. Who are they representing if not the best interests of Utah?"

In connection with this statement I desire to direct attention to an address by Hon. William Spry, governor of Utah, delivered at the governors' conference held at Madison, Wis., November 11, 1914, setting forth very clearly the western viewpoint on the question of so-called conservation:

ADDRESS BY GOV. SPRY.

"Mr. Chairman, the consideration shown the West by this distinguished organization, in providing for a presentation and discussion of the western view of the natural resource question, is deeply appreciated. Involving, as conservation does, questions of public policy, questions of equity, and questions of consistency in governmental control and disposition of the public domain, it is a privilege to be afforded opportunity to discuss the subject with you, who, by reason of your familiarity with the practical operation of the national policies, past and present, are exceptionally qualified to consider, weigh, and determine the merits of the claims that we of the West are making regarding the latest policy of the Government as it relates to the handling of the remnant of the public domain of our Nation.

"You are acquainted with the problems of financial management in the particular States over which you preside; you know concerning the social, industrial, educational, economic, and development problems that confront the States, and therefore are in a position, I take it, to grasp the significance and full meaning of the representations which we shall make to you. You have doubtless met some of the trying problems with which we are now grappling. Perhaps you have found them less difficult of solution, because of your greater development and the larger financial resources at your command with which to meet them; but you have met those things, and, having met them, you will the more readily understand our position.

"The voice of protest which has been raised in the West against the Federal attitude in the matter of forest, mineral, hydrocarbon, and power withdrawals, and the withholding of powers and functions in the control and management of the public domain that heretofore have been largely delegated to the respective States, has been severely criticized by the unthinking, who have been led into a blind but none the less enthusiastic support of a policy that appears to have been conceived in selfishness, and this earnest protest has been erroneously characterized as an effort to renew the old State rights question. Permit me at the outset to make it clear that I have no disposition to renew or even engage in a discussion of that subject. Our complaint is against apparent discrimination. The West protests against a most hurtful policy with respect to its public lands and appeals to the fair-minded in the older States to afford relief from the operation of a policy that is causing retardation in development, and which is being foisted upon it in the name of conservation.

"I believe the governors of the public-land States, to a man, recognize and respect not only the right but the duty of the Congress of the United States to control and dispose of the public domain and the public resources held in trust for the several States in such manner as in its judgment will best promote the common welfare. I believe also these governors recognize that that management and control shall be exercised in accordance with the spirit of the Constitution and in strict accord with the provisions of the trust grants under which the National Government came into possession of much of its public domain; and, too, with at least a reasonable regard for conformity to policies and practices that, in the very nature of things, must be continued without marked deviation if we would maintain as sacred and binding the very fundamental principle of our Union—equality in the sisterhood of States. Further than that, I believe the governors of the public-land States stand shoulder to shoulder in their demand that those sacred compacts between States and Nation, as set forth in the respective enabling acts, affirmed by the several State constitutions and sealed by the voice of the people in the various civil subdivisions, be kept in spirit and in letter, and not be subject to interpretation by bureau underlings whose rulings, if uniformly wrong, bear the striking characteristic of being uniformly against the States and in favor of the National Government. The agitation for legislation to sustain these bureau attachés in their arrogated powers is a move of portentous

concern to the public-land States, and we are fearful that the campaign for the manufacture of conservation sentiment will result in measures that will work irreparable injury to our section of the country.

"With that statement as a preface, and with a firm belief that you are as deeply interested in the promotion of the common welfare as were those illustrious men who evolved and established and maintained for half a century our liberal public-land policies, I shall, without any attempt at a discussion of the legal phases of this important subject, endeavor to present to you a few facts regarding the acquirement, control, and disposition of our public domain; a few facts regarding the present national attitude toward the remaining public lands and resources, and as many facts as possible, in the short time at my disposal, regarding the effect of this new attitude on the States containing the remnant of our public lands and resources.

"The general union of the States under the Articles of Confederation was difficult of consummation by reason of the conflicting claims to the vacant western territory. Demanding that all this territory should be surrendered and thrown into a common fund, certain States whose colonial charters gave them no rights in the vacant lands hesitated to join the Union, and Maryland went so far as to make the surrender of these lands by the landed States an indispensable condition of her accession to the Union. New York, in February, 1780, made the first concession in this regard by ceding her claims, and in the same year Congress made an earnest appeal to the States to follow the example, promising that the territory so relinquished should be disposed of for the common benefit and formed into republican States. Virginia complied with the request and Maryland ratified the Articles of Confederation in March, 1781. Georgia, however, did not relinquish title to her western lands until 20 years later.

"Under the provisions of the Federal Constitution Congress was made sole authority in all matters relating to the lands of the Nation. These land possessions were greatly expanded in 1805 by the cession of Louisiana by the French. A little later possession was taken of western Florida, and in 1819 the entire Territory of Florida was yielded by Spain. Twenty-five years later Texas entered the Union at its own petition. Then followed the acquisition of California and New Mexico by the treaty of 1848, after the War with Mexico. This acquisition of original Mexican territory was further enlarged by the Gadsden purchase of 1853, and in 1867 the lands of Alaska were ceded to the United States by Russia.

"From a time antedating the adoption of the Articles of Confederation to the present day no matter of public concern has been more constantly before the American people than the question of disposing of the vast public domain of the United States. Various conditions had been attached to the cessions made by the several States, but all agreed in this one, namely, that the territory thus ceded should be a common fund for the joint benefit of the then and future members of the Union.

"Around the national policy in the disposition of the public domain acquired not only by cessions from the various States, but by succession to Great Britain and by purchase, discovery, and conquest, has waged a controversy that on the one side has found its supporters among those who maintained that the lands were an asset of the Nation, to be disposed of for the purpose of producing revenue only, and on the other by those who were of the opinion that they should be held by the Government in trust only until a time when they could be released to the people for their use, which use contemplated occupation, cultivation, and improvement. Prior to the adoption of the Constitution settlement on the public lands was not encouraged, it being thought that the sale of large parcels at auction would enrich the Treasury to an extent sufficient to liquidate the public debt. About a million and a quarter acres were disposed of in this manner prior to 1789. There was, however, at that time excuse for such a policy. The debts of the Revolution were a heavy burden upon the Government, and people had ceded their lands in trust for the purpose of paying that debt. By statesmen who made a deep study of the cessions it has been asserted that many of the lands were turned over as a guaranty that the debts would be paid. These debts were cleared during the administration of President Jackson. The theory, however, that the public lands should be regarded as a source of revenue early met with strenuous opposition. Before the British House of Commons Sir Edmund Burke had contended that any policy which would induce a more extensive settlement of the soil would most greatly benefit the Government, and this doctrine was strongly urged by the minority in this country.

"In 1790 Alexander Hamilton submitted a plan for the disposal of the public lands which embodied the fundamental principles of both colonial and present systems. In 1795 the present system of surveys was adopted in substance, and five years later Government sales at $2 per acre were authorized. Again, in 1800, this system was modified, and the credit feature introduced at that time led to overspeculation in lands, with the result that in excess of one-quarter of the purchases made prior to 1820 were forfeited to the Government, and much distress was experienced by the settlers in the newly opened country in their efforts to comply with the purchase requirements. This law was repealed in 1820 and the price of lands again reduced to $1.25 per acre, with the further provision that all lands that failed of sale when offered at public auction could afterwards be purchased in unlimited quantity at that price.

"More and more the utilization of the public domain in taking care of an ever-increasing immigration became a necessity, and stronger grew the sentiment that the land should be made easily available to the bona fide home seeker. The long fight which was waged resulted in the preemption system, recognizing the settler above the speculator, a system which really found its origin in 1801 when Congress protected the settlers on lands which had been excluded from the original purchase made by Symmes, and continued to grow under the active support of President Jackson, Senator Benton, and others, until it developed into the preemption law of 1841, an act under which actual settlers enjoyed the right in preference to anyone else to purchase at a fixed price the lands on which they had settled to an extent of 160 acres. With minor modifications, the law continued in force until 1891, when it was repealed, after approximately 200,000,000 acres had been disposed of under its provisions.

"One of the great champions of the policy through which the public lands were made easily available for the home seeker was Senator Thomas Hart Benton, of Missouri, who towered as a national figure in promoting the interests of the West. Almost annually from 1824 till he saw his ideas in operation Benton presented bills for the sale of lands at fixed, graduated prices. Of him and his views on this subject, ex-President Roosevelt in his life of Benton has this to say:

"During Adams's term Benton began his fight for disposing of the public domain to actual settlers at a small cost. It was a move of enormous importance to the whole West, and Benton's long and sturdy contest for it and for the right of preemption entitle him to the greatest credit. He never gave up his struggle, although repulsed again and again, and at the best only partially successful, for he had to encounter much opposition, especially from the short-sighted selfishness of many of the northeasterners who wished to consider the public lands purely as a source of revenue. He bitterly opposed the then existing system of selling lands to the highest bidder—a most hurtful practice—and objected to the establishment of an arbitrary minimum price, which practically kept all lands below a certain value out of the market. Altogether he assisted in establishing the preemption system and had the system of renting public mines, etc., abolished, and he struggled for the principle of giving the land outright to settlers in certain cases. As a whole his theory of a liberal system of land distribution was undoubtedly the correct one, and he deserves the greatest credit for having pushed it as he did.

"Continued advocacy of liberal policies in disposing of the public lands brought the question to the proportions of a national issue and resulted in the homestead bill of 1852, granting free homes to the landless settlers. Ten years later it was written into law and approved by President Lincoln, after a previous veto by President Buchanan. This bill marked a radical change in the system that had prevailed for 80 years, during which time the public lands had been largely treated as a direct national asset for the purpose of acquiring revenue. Under the provisions of this bill they were to be granted to actual settlers who would occupy, improve, and cultivate them for a term of years and then receive a patent free of charge, upon the payment of fees sufficient only to cover the costs of survey and transfer of title. Three years after the adoption of this policy President Jackson in his annual message said:

"The homestead was established only after long and earnest resistance. Experience proves its wisdom. The lands in the hands of the industrious settlers whose labor creates wealth and contributes to the public resources are worth more to the United States than if they had been reserved as a solitude for future generations.

"It was through the liberal land system of the National Government that the waste places of the vast public domain were gradually reclaimed and made to provide homes and prosperity to the great tide of immigrants that flowed to this country. It was by reason of the liberal land policies that great manufacturing and industrial enterprises sprang up; that populous commercial centers were established; that States grew in the power and prestige that go with wealth and population; and the while the subduing and conquering influences of the home builder were reaching farther and farther westward. The growth of the remote western Territories was so vigorous as to win for them, one by one, the coveted powers of statehood and admission into the Union on terms of equality with the older States. Shouldering in confidence the increased responsibilities that came with statehood, these young members of the Union

set about the business of State building, serene in the belief that the land and resource capital within their respective borders constituted an asset on which absolute reliance could be placed.

"Remote from the thickly populated centers these Western States waged a vigorous campaign of land and resource exploitation in an effort to put their capital on an earning basis. The soils were cleared and broken, and when turned and seeded yielded enormous crops; the mountains when penetrated revealed great deposits of the various minerals and hydrocarbons; the forests, on close examination, showed remarkable stands of choice timber; the mountain streams and rivers, when diverted to succor plant life, immediately became immensely valuable, and were found, after the advent of electricity, to be capable of producing almost limitless power for turning the wheels of the various branches of industry that were springing up. Altogether the so-called desert and waste places of the North American continent gave abundant evidence of being among nature's most favored localities, and spots where she had, with lavish hand, provided the valuable resources which, when converted to useful purposes, build up communities, States, and nations.

"A halt was suddenly called to this growth and development. Uncertainty took the place of confidence and a condition of paralysis overtook the West. The mildest language that one can employ in mentioning the causes that led up to this change of national policy and resulting stagnation to western resource development is that covetous eyes looked upon the heritage of the public-land States and there appeared in the land agitators with conservation on their lips—a high-sounding word that, while covering a multitude of meanings, none the less appealed to the American people as the word "thrift" would appeal to a Connecticut Yankee. Like cleverly worded advertising phrases, it "caught," and so it transpired that six years ago there was held, on the invitation of President Roosevelt, at the suggestion of the Inland Waterways Commission, in Washington, D. C., the first conservation congress.

"Called ostensibly for the purpose of considering the proper use of the mineral, land, and water resources of the Nation as matters of vital concern to all the people of the United States, it was assumed that discussions would be confined to waste-prevention measures, and that through the interchange of ideas there would be evolved a wise policy of foresight in the administration of the public domain—a policy which in its practical operation would have in view the needs of the future while adequately meeting the demands and necessities of the present. The conference, however, developed into a spectacular, wordy exploitation of alleged facts regarding the exhaustion of the natural resources. The moderate expressions of fear that wanton waste would work a hardship on future generations that were employed to attract men of prominence to the councils of the conference were relegated by a self-appointed coterie of resource guardians, who, supported by extravagant statements regarding the depletion of the land, timber, mineral, coal, and power resources of the country, raised a hue and cry that brought the startled Nation abruptly to the very brink of a yawning chasm of resource famine. Statistics were presented, and at the time undisputed, to prove that in a very short time the vast mountain ranges would be stripped of ore, that the iron age would be a thing of the past, that people would actually suffer from cold for want of coal, that the mediums of exchange would have to be abolished—in short, that the great American Republic, rich as it was popularly supposed to be, would soon face a veritable bankruptcy of public resource.

"State executives departed from this first conservation congress with the understanding that the several States would have influence, if not voice, in shaping a new and wiser policy of public-land administration. Subsequent developments have proven, however, that the forces behind this movement had no such idea. The deliberations and conclusions of succeeding conferences have been more and more dominated by Government officials and bureaus. In the meantime the continued cry of resource famine has made its impression on Congress, as reflected in the measures extending the powers of the President in land, mineral, timber, oil, and power withdrawals; and the Presidents, on ill-advised recommendations, based on hasty field examinations, have exercised their authority in extensive withdrawals that are most seriously retarding development in the very sections of the country that stand most in need of the vestment of the public domain in the hands of the home builder and those who are willing to develop it on the most liberal terms.

"It is objection to this new policy of resource administration, the outgrowth of the conservation movement, that has been termed a renewal of the old "State rights" questions—a characterization of our protest decidedly unfair and calculated to prejudice our position in the minds of many who would look with disfavor on the revival of that disagreeable controversy. As to our view on the subject: With the fact firmly established that States are admitted into the Union on terms of equality, consider that the Nation has operated for many years under a liberal policy in the disposal of its lands; that the liberal land system has been fundamentally responsible for the growth, development and wealth of the great centers of the East; that an empire within an empire—the great empire of the West—is retarded on the threshold of an era of development that from all indications will eclipse the wonderful growth of the East; that the sale of agricultural land was primarily responsible for the increase in population in the East; that the development of the mineral and coal resources added to the wealth of the East and that the use of all the bounteous gifts of nature made the East what it is to-day.

"Because of the extravagant representations heretofore mentioned, the former liberal policy of the Government has been materially curtailed, vast areas have been withdrawn from entry, new and radical departures in the regulations governing the handling of mineral and oil lands have been adopted, and the cry is going up for Government ownership of all power sites. Under this policy the States wherein the public domain as yet lies practically in its virgin. state are deprived of that benefit that accrued as a direct asset to the older States through the disposal of the public domain and utilization of the public resources thereon. It is obvious that the development which came to the older States through the vestment of the land in individuals will be deprived the younger and less-developed States, and that, while the greatest direct benefit of the former liberal policy accrued to the individual States wherein sales were made, the direct benefits, not only from the sale but from the development of the public lands in the Western States, under the proposed policy will go to all the States of the Union, being distributed as a common fund, which common fund in the past has rarely been appropriated by Congress for internal improvements in the West.

"Suppose the Government leases its mineral, coal, and oil lands and water-power sites and remains forever vested of title. Who can estimate the loss in revenue from taxation that will be suffered by the States wherein these valuable resources are located, which revenues have for years been accruing to the older States and will continue forever to accrue because their resources have been vested in private ownership and are subject to taxation by the States—a thing which it appears will be utterly impossible under the leasing system so long as the Government holds title, since Government lands can not under the Constitution be subjected to taxation?

"This phase of the leasing system alone condemns it as a policy in absolute violation of the spirit of equality of rights in the public domain. A material factor in the growth and development of a State is the distribution of the burden of taxation. Take from the State its right to tax mining claims, the mineral and oil output, the coal product, and the power sites within its boundaries and you rob the Commonwealth of a revenue that has been a source of ever-increasing income to the older States, and increase, rather than diminish, the tax burden the freeholder is already called upon to bear. This, indeed, is a most serious matter to the public-land States. Take, for instance, the State I represent. Utah, with an area of 54,380,000 acres, has but from ten to twelve millions of acres in vested ownership or process of transfer, and much of that consists of grazing lands that yield but slight income through taxation, and according to the records of the United States Land Office there stood of record in Government ownership, as of November 1, this year, over 72 per cent of the entire area of Utah. If our sources of revenue for local self-government were adequate to the increasing demands, or if our revenue were in excess of our needs and we were squandering the income, I grant this national curtailment of State development through land withdrawals would not be so serious, but it is a fact that additional land ownership, with improvements, more extensive mining operations, greater power development, and all those activities that make for a prosperous community are imperative necessities in Utah to keep abreast the expense of maintaining schools, State government, State institutions, and carrying on internal improvements. During the biennial period 1913–14 Utah will expend for purely educational purposes approximately 88 per cent of its entire State revenue from taxation, and when I tell you that in arriving at that percentage public utilities, net proceeds of mines, and all assessments made by the State board of equalization are included with the taxes levied on real estate, personal property, improvements, and all other taxable possessions, you will realize that we are devoting our income to worthy objects. You will realize also that we are facing a very serious problem, and our need for a continuation of those policies which have been the most potent factors in the development of our sister

States is a great one. It is not so much a question as to whether National or State governments shall control the lands and resources as it is an absolute necessity that the lands and resources be placed in the hands of industrious settlers who will develop them, thereby adding to the material welfare of the States in which they lie and the greatness of the Nation of which the States are a part.

"It is but a short step from the mineral leasing system to the leasing of agricultural lands. If it is proper that the sturdy pioneer prospector who stakes his all on a chance that he will add to the mineral production of the country; the man who invests his money, his talents, his energy, the sweat of his brow in delving after the mineral deposits of the Nation, and who, after the expenditure of his means finds a "pay streak," installs machinery, opens up a vein of ore which, but for his persistence, would have remained hidden for centuries, perhaps, must turn over to the Federal Government what he has found, and if he will continue to develop it he must do so as a lessee, why should not the same policy be proper in handling the agricultural lands? Why not let the homeseeker select a piece of raw land which he regards as a possible producer of agricultural products, clear it of sagebrush, plow and seed it, and if in the arid section of the United States, let him, at his own expense, acquire and deliver to that land the water which is necessary to produce the crop; and then, if the experiment be a success and he secures a harvest, let him become a lessee of the Federal Government and work his land, not as an independent freeholder but as a tenant of the National Government, which becomes his landlord? How long, can you tell me, will we be compelled to wait on the National Government to put the agricultural, mineral, oil, and coal lands in a condition for tenancy? Aside from this, landlordism has ever been autocratic, overbearing, while tenantry has developed people who lack in the two most necessary qualities of American citizenship—loyalty and patriotism. In Utah we have been building our State by urging the people to own their homes, to own their places of business, and to own the business in which they are engaged, and it is the only policy that will make for that kind of citizenship which will perpetuate the American form of government. Tenantry is repugnant to the ideals of American citizenship.

"You will agree, I think, that there are two distinct views of the conservation question, the one which, unfortunately, has been the official view—narrow, selfish, looking altogether to the welfare of generations yet unborn, totally ignoring obligations of trusteeship and brushing precedent aside so ruthlessly as to render experience an invaluable thing; and calculated to enrich the General Treasury at the expense of the younger and financially weaker States. The other, the view of those who recognize a tendency toward extravagance in the improvident drafts on the natural resources and who, recognizing the evil, have a sincere desire and determination to avoid waste but continue development.

"In the beginning, we are informed by Holy Writ, after creating the heavens and the earth and all that in them is, God created man and gave him dominion over the fishes of the sea, the fowls of the air and the beasts of the field and bade him use all things created. That dominion man has always held and exercised, and in so doing has been compelled to draw upon the resources largely in accordance with the day and generation in which he lived. Up through the various stages of civilization man has been compelled to gain his living by the use of the things over which God gave him dominion, and so long as civilization endures, so long, indeed, as intelligent beings exist man must continue to live through some method of utilizing the resources about him, and the success of his struggle for survival and advancement will be measured by his ability to understand and make those resources useful to his purposes with least extravagance and loss.

"The one important consideration in connection with the handling of our resources, overlooked by the conservationist, is the fact that primitive man made but primitive drafts upon the resources which he found most easily available and convertible, and just so long as those drafts were primitive, man remained primitive; when modern man made modern requisition on nature's storehouse, civilization had attained a much higher perfection.

"When men lived in mounds and caves, the forests were slightly disturbed and civilization was not very far advanced; when they rubbed sticks to make a fire, sulphur was not being exhausted; when they paddled in canoes and traveled overland by horseback, our steel deposits were aging in the everlasting hills; when men went whaling for blubber to make candles, electricity was unknown and this powerful and subtle force was a mystery of the elements; when men gathered a few sticks of driftwood to cook their meals, the coal deposits were unmolested; when scribes were a rarity, if not a novelty, and historians carved heiroglyphics in stone, wood pulp was not even in demand; and when men were content to merely exist, the demands that manufacture, trade, and commerce have made upon our natural resources were not even dreamed of.

"Look conservation squarely in the face and answer: Would you exchange the modern home, with its accessories and comforts, made possible through the use of the natural resources, for the dugout of the man who made his home in the mound, or the habitation of the cliff dweller? Would you exchange your sulphur match for the wooden stick or flint of days gone by? Would you barter your electric lamp for the candle made from the blubber of whale? Would you give up your modern sea vessel or twentieth century steel train, your automobile, for the canoe of your forefathers, the horse of the mail carrier, or the one-hoss shay of your ancestors? Would you give up your newspapers, your magazines, your libraries, your textbooks for the tablets of stone? Would you silence the busy machinery of manufacture, would you stop the wheels of commerce to go back to the life of a century ago? Would you exchange all or any of those accessories of modern civilization for every atom of natural resource that entered into their making?

"Would any one of you, having at heart, first, the true interests of your country; second, the welfare of the State you represent; and, third, the well-being of your fellow men, exchange 100 families, who were willing to temporarily forego the comforts of life and locate on the public domain for the sacred purpose of home building, uproot the sage and greasewood, drive the plow into the parched earth, conserve the sunshine, the rain, the snow; make the land fruitful and pleasing to look upon where before it was a barren and dreary waste; drive the lean and hungry coyote one ridge farther back toward the fastness of the mountains; would you exchange 100 State builders for a forest reserve, with a small stand of timber, a vast area of sagebrush, and a forlorn hope that seeds from Germany will produce timber for the use of generations yet unborn?

"In his message to Congress December 4, 1832, President Andrew Jackson said:

"It can not be doubted that the speedy settlement of these (public) lands constitutes the true and best interest of the Republic. The wealth and strength of the country are its population and the best part of the population are the cultivators of the soil. Independent farmers are everywhere the basis of society and true friends of liberty.

"In addition to these considerations questions have already arisen and may be expected hereafter to grow out of the public lands which involve the rights of the new States and the powers of the General Government, and unless a liberal policy be now adopted there is danger that these questions may speedily assume importance not now generally anticipated. The influence of a great sectional interest when brought into full action will be more dangerous to the harmony and unison of the States than any other cause of discontent, and it is the part of wisdom and sound policy to foresee its approaches and endeavor if possible to counteract them.

"It seems to me to be our true policy that the public lands shall cease as soon as practicable to be a source of revenue, and that they be sold to settlers in limited parcels at a price barely sufficient to reimburse the United States the expenses of the present system and costs arising in our Indian compacts. The advantages of accurate surveys and undoubted titles now secured to purchasers seem to forbid the abolition of the present system, because none can be substituted which will more perfectly accomplish these important ends. It is desirable, however, that in time this machinery be withdrawn from the States and the right of sale and the future disposition of it surrendered to the States, respectively, in which it lies.

"The adventurous and hardy population of the West, besides contributing their equal share of taxation under our impost system, have in the progress of our Government, for the lands they occupy, paid into the Treasury a large portion of $40,000,000, and of the revenue received therefrom but a small part has been expended amongst them. When, to the disadvantage of their situation in this respect, we add the consideration that it is their labor alone which gives us real value to the lands and that the proceeds arising from their sale are distributed generally among the States which had not originally any claims to them, and which have enjoyed the undivided emoluments arising from the sale of their own lands, it can not be expected that the new States will remain longer content with the present policy for the payment of the public debt. To avert the consequences which may be apprehended from this cause to put an end forever to all partial and interested legislation on the subject and to afford to every American citizen of enterprise the opportunity of securing an independent freehold, it seems to me, therefore, best to abandon the idea of raising the future revenue out of the public lands.

"In the United States and Alaska there is a total area of 2,315,310,728 acres, including a water surface of 34,000,000 acres. The great bulk of this area was at one time or another a part of the public domain. It is not only interesting as a matter of history, but imperative as a matter of information, if we would pass intelligent judgment on the present public-land question, to ascertain how this immense estate has been divided and distributed.

"Eighteen States—Connecticut, Delaware, Georgia, Kentucky, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, North Carolina, South Carolina, Pennsylvania,

Rhode Island, Tennessee, Vermont, Virginia, and West Virginia—retained exclusive jurisdiction to all the lands within their respective borders, and Texas, on admission to the Union, did likewise. All told, those States reserved jurisdiction to 473,712,320 acres (including the District of Columbia), or 20.47 per cent of the entire area of the United States. In the 18 States of Alabama, Arkansas, Florida, Illinois, Indiana, Iowa, Kansas, Louisiana, Michigan, Minnesota, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, and Wisconsin are 701,383,480 acres, or 30.04 per cent of the total area of the United States. On June 30, 1913, according to the report of the Commissioner of the General Land Office, these States contained but 7,914,929 acres of unappropriated and unreserved public lands. In the 11 remaining States—Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming—commonly called the public-land States—there is a total area of 761,044,620 acres, or 32.88 per cent of the total area of the United States, of which 290,016,757 acres, or 38 per cent, was unappropriated and unreserved June 30, 1913. The Government reservations at that time within these States approximated 191,797,151 acres, so that about 63.3 per cent of the total area of these States is still awaiting settlement. The remaining 10.63 per cent of the total area is in the Territory of Alaska, which embraces 378,165,760 acres.

"In pursuance of the national policy regarding reservations out of the public domain of such parcels of the public land as may be necessary for the common defense or the general welfare, or, in other words, such as are required to be appropriated for national uses, immediate and expectant, Congress has established from time to time military and naval reservations, Indian reservations, and lighthouse reserves, and in addition, in furtherance of the conservation idea, has established parks, national monuments, and forest reservations. While these are intended primarily for the benefit of the whole of the United States, it is interesting to note their location.

"United States Indian reservations, according to the latest available figures, June 30, 1912, embraced 38,903,388 acres, of which 32,752,630, or 84.2 per cent, were in the 11 public-land States.

"The total area of national-forest reserves June 30, 1913 (exclusive of Alaska, 26,748,850, and inclusive of Porto Rico), was 159,867,798 acres. Of this 152,945,148 acres, or 95.67 per cent, were in the 11 public-land States.

"On June 30, 1913, there were 28 national monuments in the United States and Alaska, embracing 1,508,627 acres. All but 1,337 acres were in the public-land States.

"The national parks have an area of 4,606,153 acres. The public-land States contain 97 per cent of this area, or all but 13,061 acres, and the Secretary of the Interior, in 1910, urged that the four parks embracing this area be ceded to the States wherein they respectively lie.

"These reservations total an area of 204,885,967 acres, exclusive of Alaska, and 93 per cent, or 191,797,151 acres, are in the public-land States of the West.

"Now, gentlemen, one skyscraper in a desert does not make a city, nor do a number of office buildings. A city grows by reason of the fact that the country surrounding it is owned and farmed, because it is furnishing lumber, because it is producing ore, or because the river on which it is located accommodates commerce or produces power. One city does not make a commonwealth. It takes many cities with many farming, stock-raising, and mining communities to make a State, and a State becomes great only as population increases and enterprises are developed. One State does not make a nation, and the seat of government and the great commercial centers are what they are only by reason of what is back of them. And that something back of them is the constructive and development force that supplies the arteries of the nation and makes it great. It is the pride of every American that this great Nation occupies its present high position among the countries of the world, and it should be the individual responsibility of every citizen to see to it that in the future the United States shall hold none but first place among the nations. That position can be maintained only through unceasing activity in development. It matters not in what section of the country our enterprises are curtailed through the operations of laws or policies of the National Government, the moment stagnation overtakes development and enterprise any place in this broad land, the curtailment is disastrous to the immediate locality and will surely be reflected in national shrinkage.

"The natural resources within the given boundaries of a State, whether vested in private, State, or Federal ownership, constitute the capital upon which that particular State must conduct its business, and that capital should not be impaired by stagnation. The business of the Government and the business of the States is being properly conducted only when the public lands go to the bona fide homeseeker; when the minerals are being converted into wealth; when the waters are being used for navigation, irrigation, and power; and when the timber is being cut to build homes, schoolhouses, and public buildings. And the Capital of the Nation and the State and the individual is being most seriously impaired when the employment of these great natural resources whose use creates life and prosperity is so restricted as to prevent their free and unlimited development.

"If we can not utilize our resources to produce valuable results, then we are poor, indeed, since poverty is the lack of property and adequate means of support. Our plea is an appeal for opportunity to make useful and profitable the great resources at our doors. We need and must have them, and, as I have before stated, the question of who shall control and dispose of them is a matter of minor importance compared with the need that they be placed in the hands of those who will develop them; and the necessity that transfers be made without the red tape and uncertainty that characterizes such conveyances as are now made of the public lands. When State selections are clear listed to the States and the States, in good faith, enter into contracts of sale with bona fide purchasers, it is but reasonable to demand that the National Government, which through its field experts has examined and classified the lands, permit titles to pass without involving purchasers in expensive litigation and without placing the States in a position where they can not live up to their contracts.

"That is what we are experiencing in Utah to-day. Aside from the fact that a great percentage of our lands have been withdrawn from entry, the titles to many of our school sections which we attempt to sell are clouded by arbitrary department rulings and local land-office decisions to such an extent that people hesitate to enter into contracts for their purchase; and all this in violation of the land grants under the enabling act of the State.

"The West solicits no sympathy, asks no favors, pleads for no advantages, but demands consistency and fair play and equal opportunity with her sister States in handling her resources."

Pension Legislation.

EXTENSION OF REMARKS
OF
HON. S. KIRKPATRICK,
OF IOWA,

IN THE HOUSE OF REPRESENTATIVES,

Thursday, February 18, 1915.

Mr. KIRKPATRICK. Mr. Speaker, before proceeding to the consideration of pensions and pension legislation, I desire to speak of what is commonly called, and generally known as, "gag rule." To me the word or term is both harsh and offensive, but the gag does not do its bidding or perform the functions in the sense of its application. Thus for illustration, as in the present case, a rule is brought in limiting general debate on the pension appropriation bill to six hours, but how is the limited time being utilized or appropriated?

The dial of the clock indicates that 5 hours of the allotted time has passed, and only 30 minutes of the same has been made use of in what I would call legitimate discussion of the measure, fully nine-tenths of the allotted time having been used in "wind-jamming" and "hot-air" methods altogether foreign to the subject at hand, but akin to the swan song of calamity howling.

Mr. Speaker, I intend to support the amendment of the gentleman from Missouri [Mr. BORLAND], which provides that no pensioner living abroad or beyond the confines of the United States, and having forfeited all rights to citizenship in this country by renouncing all his or her allegiance to this country, shall receive any pension on or after the passage of this act except in such cases where injuries were incurred in the line of military duty. Of this number, I am informed, there are about 5,000, and the gratuities paid this class of pensioners exceed $1,000,000 annually.

I am in favor of removing the restrictions now existing against women who have married Civil War veterans since June 27, 1890, or at least extending that time to January 1, 1900. Then there is the class of soldiers who enlisted for 90 days, who for some reason were discharged one, two, or three days before their time of enlistment expired, and can not now recover a service pension. Then there is another class of pen-

sioners, war widows, getting 40 cents a day. A President's widow gets $5,000 a year, with no military record. Now, a war widow can easily forfeit her daily allotment with a view of remarrying, but the pension paid a President's widow is almost prohibitive.

There was Mrs. McKinley, a noble woman, God bless her! The Congress granted her an annuity of $5,000. Now, some will say that Mrs. McKinley's husband was killed. Regretfully true; but many a real war-widow's husband was also killed, and her only recompense is the paltry sum of $12 a month. While the pension fund is the most equitable fund that is disbursed by the Government, still the manner of compensation and distribution in many cases is almost intolerable.

Talk about compensating a soldier for having lost an arm or a leg, or having lost his sight, at the rate of $40 a month! Yet there is some consolation in the fact that when one leg is a little shorter, then the other is a little longer. A war widow should receive at least the pension paid her husband before his death.

The pension budget this year will scarcely exceed $150,000,000, a per capita of $1.50. None of the fund so paid is lost. Automatically it goes back into the legitimate channels of trade, industry, and commerce. All this promotes prosperity. Stop the payment of a quarterly installment to-day, and 90 days later withhold the payment of another, and under past financial agencies a panic would ensue. A bill of mine lies withering in committee, authorizing the payment of pensions monthly. Who of us in this House would vote for the adjustment of our salaries on the quarterly plan instead of monthly? The monthly payment plan would turn loose many millions of dollars 30 and 60 days in advance of the present time, thus enabling the business world to discount many of their time obligations.

Senator Ben Wade once said in the Senate of the United States:

I am for the laboring portion of our people; the rich can take care of themselves.

Thus, Mr. Speaker, I am for the men who saved this country from all the influences of dissolution and destruction.

The Post Office Department.

EXTENSION OF REMARKS
OF
HON. WILLIAM M. CALDER.
OF NEW YORK,

IN THE HOUSE OF REPRESENTATIVES,

Saturday, February 20, 1915,

On the bill (H. R. 21328) making appropriations for the support of the Military Academy for the fiscal year ending June 30, 1916, and for other purposes.

Mr. CALDER. Mr. Speaker, I have read with considerable interest the press dispatches and editorial comment on the policy of the administration in economizing and reducing the expenditures for conducting the public business in the different departments of the Government. These announcements seem to have struck a responsive and sympathetic chord in the public mind and in the minds of public men, judging from the expressions of opinion by many of the Members of this body with whom I have discussed the subject. The impression seems to be going forth that the Democratic administration was about to redeem its pledges made to the people in the campaign of 1912. In order to satisfy myself on the subject and be prepared to discuss the matter intelligently, I examined the Book of Estimates issued by the Treasury Department, which contains the estimates of the department heads for conducting the business of the Government over which they have jurisdiction. I also read the reports of these officers and the recommendations contained therein.

I desire to confine my remarks to the Postal Service, and will therefore draw the attention of the Members of the House to several statements that appear in the report of the Postmaster General. I believe they are worthy our serious thought and consideration and should be brought to the attention of the country in their true light. The report of the Postmaster General is in a sense a remarkable document, and one in which his conclusions and recommendations will attach to the name and memory of the present head of the Post Office Department long after he ceases to preside over its affairs.

In the name of economy, he recommends the repeal of the 8-hour law for postal employees, and a repeal of the law which grants to these employees one day of rest each week, both of which are recognized principles of this Government in regulating the working conditions of employees. He recommends letting out to contractors the delivery of mail on rural routes, forgetting evidently the scandals of past years when this system was in vogue for carrying mail on star routes. He recommends the repeal of the law which regulates and classifies the salaries of railway mail clerks, post-office clerks, and city letter carriers so that it will be impossible for these employees, no matter how efficient they may be, to receive a promotion in a shorter period than two years. He recommends a reduction in the pay of substitute employees who under the most favorable conditions do not make a sufficient amount to keep body and soul together under present conditions. He recommends a readjustment of the salaries of postmasters, which means on its face a reduction in the salaries of the great majority of men who have charge of the post offices throughout the country. He recommends the enactment of a law that will compel our citizens to erect private mail receptacles for the receipt of mail, and on failure to do so would compel the public to call at post offices for their own mail.

All these recommendations and many others of a similar character are proposed in the name of economy. Yes, Mr. Speaker, to read the report one would think that the Postmaster General is evolving a plan that will meet with popular approval. He seems not to have graduated from the old school that believed in getting the last ounce of energy out of those who do the real hard work in the department over which he presides.

To the credit of the House Committee on the Post Office and Post Roads let it be said that they refused to embody in the Post Office appropriation bill the recommendations that would place the Postal Service back in the same condition it was in 20 years ago. Every recommendation above referred to would, if enacted into law, mean the taking away of some beneficial legislation that has been granted by Congress in recent years to improve the working conditions of the employees. His recommendations mean that the reforms that it took years to bring about are to be thrown aside on the recommendation of an official who knows little or nothing about the practical workings of post offices. His report shows a total disregard for the welfare of the great army of employees whose comfort and well-being in performing their daily labors are under his jurisdiction.

This may be economy as Postmaster General Burleson sees it, and it may be the only way he can conceive of to economize in expenditures, but this kind of economy has never met with approval by the taxpayers of this country when they have had a chance to express their opinion at the ballot box.

PROMISES OF THE DEMOCRATIC PARTY FOR ECONOMY.

The Democratic Party has made promises of economy to the American people. It seems, however, that with them promises and performances are two different and unrelated things, as was shown by the Baltimore platform and the total appropriations of the last session of Congress. Since that time an election has been held and the result has been very disquieting to our friends who have been in charge of the Government for the past two years. Millions of dollars have been expended in the appointment of committees or commissions to investigate every conceivable thing under the face of the sun, and the reports speak for themselves. Now, after two years of control in every branch of Government, during which time the business of the country has been thrown into a state of chaos and hundreds of thousands of men are idle who should be employed, a new spirit takes hold of the administrative officers. A spirit of economy so called, and it is heralded throughout the country by the publicity bureaus maintained in each of the several departments of the Government.

Let us take some of the recommendations of the Postmaster General and get at their real meaning.

TO ABOLISH THE POSITION OF ASSISTANT POSTMASTER.

It is recommended that the position of assistant postmaster be abolished. A dissertation then follows the recommendation showing how useless the position of assistant postmaster is to the service, and how the duties of this official are to devolve upon two new officials to be created under the proposed plan of economy. Those of us who were in the House during the last session remember the several attempts that were made to take assistant postmasters from under the protection of the civil-service law. All sorts of arguments were advanced showing why this position should be exempt from the civil service, but the only one and true reason was a desire of our friends on the Democratic side of the House to have these positions filled by appointment of party followers under the spoils system. The attempt failed, and now a new scheme is evolved and we are told that assistant postmasters are needless officials, as

they are to be replaced by appointment of two high-priced officials with other designations whose salaries will be far in excess of those paid to assistant postmasters at the present time.

TO COMPEL EMPLOYEES TO WORK SEVEN DAYS A WEEK.

The attempt to repeal the law which allows a day of rest each week for the employees who collect, distribute, dispatch, and deliver the mails is based on the statement that the department should have more latitude, and that it would be a saving to the Government in money.

Prior to the enactment of the act of August 24, 1912, post offices were open for the delivery of mail to the public on Sundays and letter carriers and post-office clerks were required to report for duty to prepare the mail for delivery. The hours of duty required of these employees varied with the temperament of the postmaster and supervisory employees in each post office.

It was not a case of necessity, but how much or how little work the officials required of the men. The corridors of some of our post offices on Sundays became the rendezvous of undesirable characters. In some cities it caused scandal, and the result was that the clergy and the business men protested so strongly that a law was passed closing post offices on Sundays and granting compensatory time to employees who were required to work on Sundays to be given on one of the six days following the Sunday that such service was performed. The result was that not only were the employees benefited by a day of rest, but many business men broke themselves of the habit of going to their offices on Sundays, and they, too, were benefited by a day of rest. We do not hear of complaints to compel the employees to work seven days a week, nor is there any demand for opening post offices again. The only complaint is from the present officials of the Post Office Department, who maintain that it costs money to employ substitutes when necessary to grant compensatory time to employees who work on Sunday and from the standpoint of economy that the employees should be required to work without any recompense whatever other than compensatory time off when the employees can be spared by local officials. That was the law prior to the act of August 24, 1912, and it was the cause of continuous complaint on the part of the employees, many of whom never received compensatory time nor an equivalent for work performed on Sunday.

The refreshing influences of the weekly day of rest on a person subjected to the strenuous routine of a busy life is best appreciated by those who are required to work hard for a livelihood. The efficiency of the workingman, the length of the working-day, the interjection of pauses for rest in the schedule of labor for persons of different ages and stations in life are questions that are constantly arising for solution on a scientific basis. Fatigue is the enemy of efficiency, and to deduct and compensate for or overcome it is the duty of those concerned with the promotion of human welfare.

And now, Mr. Speaker, I trust that the Members of this House, instead of giving ear to any suggestions for a repeal or modification of the weekly rest-day law for postal employees, will go a step further and at the first opportunity enact a law that will require a day of rest each week for every employee in the Government service.

RURAL FREE DELIVERY SERVICE.

In his annual report the Postmaster General draws attention to the cost for maintaining the rural delivery and collection service. He maintains that this service is entailing an expense to the Government of $40,000,000 in excess of the revenues produced by the service. He then draws a comparison between the star-route service and the Rural Delivery Service and how the star-route service is maintained at a much lower cost than the Rural Delivery Service. In fact he makes the statement that if the Rural Delivery Service were placed on a contract basis there would be a possible saving to the Government of from $15,000,000 to $20,000,000 annually. His final conclusion regarding the future of the Rural Delivery Service is that it should be placed on a contract basis, and he so recommends in his report.

There is not a question of doubt in the mind of any business man that a great saving in money could be had by placing the Rural Delivery Service on a contract basis. Any service of the Government could be maintained at a lower cost if such service were placed in competition and awarded to the lowest bidder. The Postmaster General seems to be unduly alarmed at the action of the Congress in granting increased compensation to rural delivery carriers. He claims to have hundreds of letters of protest from patrons on the rural delivery routes against the granting of increase in salaries. He even enlightens us with some of the suggestions contained in this numerous correspondence, one individual going so far as proposing to collect and deliver all mail matter on rural routes of the country for $10,000,000 less than the present cost.

I do not believe that the American people or the Congress will look with favor on the suggestions contained in the Postmaster General's report to have the rural delivery and collection service let out to contractors. It would be impossible to have the same supervision over a contract service or to maintain the same discipline among the contractors or their employees or to expect a contract service to be maintained at the same standard of efficiency as now prevails in the Rural Delivery Service by rural delivery carriers. Under a contract system contractors could employ whoever they might see fit to deliver and collect the mail in rural communities, whether such employees would be looked on with favor by the patrons on the different districts or not. Character, ability, or efficiency would cut no figure whatever. It would be a case of employing the cheapest kind of labor in order that a profit might be made by the contractor.

Under the present system before a rural letter carrier is appointed he must file application, certify to his character, and show that he is a fit man for the service before he is permitted to take a competitive civil-service examination. Even after he has complied with all the requirements sent out by the department and the Civil Service Commission, if there is any decided objection to the man, even though he be at the head of the eligible list for appointment, the postmaster can recommend rejecting his name by giving good and sufficient reasons. There can be no comparison between men selected under the system now in vogue and the class of men that would be mustered into the service under a contract basis. The economy suggested in the imaginative mind of the Postmaster General could not possibly compensate the Government or the people of this country by destroying the Rural Delivery Service, which has been built up to its present high standard, and turn it over to contractors, where it would degenerate into a question of dollars and cents to the contractors. It might be well for the Postmaster General to look through the files and records of the Post Office Department and refresh his memory on the famous star-route frauds that shocked the country several years ago. If he is prepared to risk a repetition of these scandals, I do not think that the Congress will agree with him.

It seems to me that the several recommendations of the Postmaster General, wherein he proposes to reduce the salaries of postmasters, to repeal the eight-hour law for postal employees, to repeal the law that grants the employees a day of rest each week, to reduce the pay of substitute employees who are paid by the hour for the actual time they are employed, to amend the classification act so that employees would not be entitled to annual promotions, no matter how meritorious the service they might render the Government, and the placing of the Rural Delivery Service on a contract basis in the name of economy, is going to extremes. If the Rural Delivery Service is to be destroyed and every piece of constructive legislation that has been passed by the Congress in recent years of benefit to the working force in the Postal Service is to be taken from them, it will result in complete destruction of the Postal Service, both city and rural, that it has taken years of patient effort to build up.

Indian Military Training School at Carlisle, in the State of Pennsylvania.

EXTENSION OF REMARKS

OF

HON. JOHN H. STEPHENS,

OF TEXAS,

IN THE HOUSE OF REPRESENTATIVES,

Monday, February 22, 1915.

Mr. STEPHENS of Texas. Mr. Speaker, we are supporting a Government Indian coeducational school at Carlisle, Pa., that, in my judgment, could and should be changed to an Indian military training school. I have introduced in this Congress a bill to effect that purpose. The bill is as follows:

A bill (H. R. 21036) to establish and maintain an Indian military training school at Carlisle, in the State of Pennsylvania, and to discontinue the present Indian school at that place.

Be it enacted, etc., That in order more effectually to provide for organizing, arming, and disciplining troops for service in time of war and more quickly to raise and support an army in the event of war, and for the purpose of maintaining an efficient Indian reserve corps, there is hereby designated and established in the State of Pennsylvania and in the city of Carlisle an Indian educational and military training institu-

tion to be known as the United States Indian military academy at Carlisle, in the State of Pennsylvania.

SEC. 2. That the Carlisle Indian School in said city and State as now constituted by law shall be, and the same is hereby, discontinued on and after July 1, 1915, and all the property of said school, real, personal, and mixed, now used, owned, or held by the United States for the purpose of and in connection with the said Carlisle Indian School be, and the same is hereby, transferred to the aforesaid United States Indian military academy at Carlisle, Pa.

SEC. 3. That for the purpose of carrying this enactment into effect a board of control consisting of the Secretary of War, the Secretary of the Interior, and an officer of the United States Army of high character and attainments, to be appointed by the President, is hereby established.

The said Army officer when so appointed shall be the superintendent of said Indian academy. That the duties of this board shall be to cooperate with the Commissioner of Indian Affairs and the superintendents of the various Indian schools for the purpose of carrying out the terms and provisions of this act.

SEC. 4. That said board of control shall have power to make and enforce all needful rules and regulations governing the admission of students to said institution, the military discipline, the number of hours given to military instruction and drills, the guarding of the barracks, the conduct of the students, their punishment or dismissal for infraction of rules, the granting of furloughs in vacation, the designation of uniforms, the calls to summer camp service, calls to war service, recommendations of graduates to reserve officers, the register of their names as required by the rules of the board, together with all such needful rules and regulations pertaining to the military features of such institution and calls to service during the contract period. All allotments of money to said academy shall be made by said board of control on the basis, as far as may be practicable, that the cadets may be kept, maintained, and educated, including board in said academy, at $200 each per year.

SEC. 5. That the members of said board of control shall receive no compensation for their services on said board other than they now receive by law.

The Secretary of War shall be president of said board. The Army officer superintendent provided for herein shall be secretary of the board, and shall devote his entire time and attention to the work of the board and his duties as superintendent.

SEC. 6. That the board of control shall accept for admission in said academy no boy who is not over 17 and under 20 years of age, is of good moral character, sound of body, fit to be a soldier, of good mind and health, and is one-fourth or more of Indian blood, and is able to pass a reasonable examination to be prescribed by the board of control touching the following subjects, namely, reading, writing, English grammar, United States history, general geography, arithmetic, and the first principles of algebra. No boy shall be entitled to admission in such institution unless he is willing to agree and does agree, in writing, that he will serve in said academy during the whole course unless sooner graduated, as hereinafter provided, and that after his graduation he will serve the United States at any time he may be called upon by the Secretary of War within a period of seven years after his graduation; that during the seven years after his graduation he will keep the War Department notified of his residence and his change of residence, if any, and during said period he will respond to any call made on him to enter the military service of the United States for any period for which his services may be needed, not to exceed the seven-year period; that he will, when required by the board of control, serve in times of peace in summer military training camps for a period not exceeding six weeks in any one year during said period.

SEC. 7. That the board of control shall provide suitable campus or drill grounds for the use of said student corps; that it will furnish a full quota of trained and efficient teachers to give said students a thorough academic education, consisting of not less than three nor more than four years' course, followed as near as may be after the course of study now prescribed at the United States Military Academy at West Point, N. Y. The United States shall furnish, and the War Department is hereby authorized to issue, such arms, ammunition, equipments, stores, service uniforms, and such other like articles as may be necessary for the use of such students and which may be furnished without injury to the military service.

The cost of training, the discipline, the organization of students in corps, the rules and regulations governing the training, mental and physical, at said academy shall be followed as closely after the course of instruction and discipline in vogue at the said United States Military Academy at West Point as may be practicable.

SEC. 8. That the sum of $200,000 is hereby appropriated, to be paid out of any money in the Treasury not otherwise appropriated, for the purpose of carrying into effect this act for the fiscal year ending June 30, 1916.

The American Flag.

If we allow the merchant marine of belligerent countries to fly our flag to deceive their enemies, it will soon cease to afford protection to American citizens and to the American merchant marine. When the American flag floats over a ship at sea, it should mean that the ship, its passengers, its crew, and cargo will be protected to the last limit of American power.

EXTENSION OF REMARKS

OF

HON. CHARLES H. BURKE,

OF SOUTH DAKOTA,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, February 24, 1915.

Mr. BURKE of South Dakota. Mr. Speaker, I ask unanimous consent that there may be printed in the RECORD a speech of my colleague, Mr. MARTIN, made at a patriotic meeting in the New York Hippodrome, in the city of New York, on the evening before Washington's Birthday, February 21, 1915.

The SPEAKER. Is there objection?

There was no objection.

The speech referred to is as follows:

THE AMERICAN FLAG.

Mr. Chairman, citizens of New York, this meeting is dedicated to the sentiment America first—and I will add America last and America all the time.

The nations of Europe are engaged in the most destructive war of all history. From our viewpoint it appears to be unjustifiable, deplorable, and cruel beyond the power of language to describe. It is inevitable that our minds should be horrified and our sympathies aroused. Ties of blood and relationship bind us to the people of one or the other of the contending nations. Ours is a composite citizenship. Go back far enough and you will find a European or a British ancestry for almost every American citizen. But whatever our origin we are now Americans. I deserve no special credit for my Americanism, for I was born so. Some of you are entitled to credit for your citizenship, because you are Americans by choice. Our obligations to the United States, however, are the same. This is one country. This is our country. A man has as much right to be false to the wife he has married as to the country he has adopted.

Absolute neutrality between the warring powers is the only attitude that the United States can assume. No other course can preserve our own peace or render us serviceable to the rest of the world in adjusting international disagreements when the smoke of battle shall have cleared away.

The man who now encourages partisanship or organizes our citizens into classes promoting the cause of one or the other of the belligerent nations is conferring a very dubious service upon the nation with which he sympathizes and is distinctly disloyal to his own Government. This is no time for disintegration; this is the hour when all elements of our population should be cemented together into one solid mass of loyal American citizenship.

Patriotism is one of the noblest sentiments that can inspire the human breast. It stands for country and home and fireside and wife and children. Aye, more, it comes to represent great ideas of progress and fundamental principles of civilization. Our own country is worthy of our most rigid loyalty and our undivided devotion. This is the land of justice, of humanity, of liberty, and universal opportunity. And the visible symbol of our national greatness, that which stands for American sovereignty on land and on sea, is the most beautiful of all national colors, the Star-Spangled Banner, Old Glory, our beloved American flag.

And the Star-Spangled Banner, O long may it wave
O'er the land of the free and the home of the brave.

My voice is raised among you to-night for the integrity of the American flag. Within the last two weeks at least two British merchant vessels have been sailing in dangerous waters flying the American colors. In my opinion this is a very serious violation not only of that comity which prevails between civilized nations, but as well of the more enlightened principles of international law, and an incident which, if allowed to go unchallenged, would likely lead us into serious international complications. The Secretary of State has lodged a mild protest against this custom, calling attention to the dangers that may result to American shipping if it is not discontinued. The reply of the British Government, published yesterday, disclaims any purpose to use foreign flags as a general practice, but is reluctant to desist from using them on merchant vessels to prevent capture or destruction.

Manifestly the situation is a difficult one in our international relations.

I believe the administration will find it necessary to make the protest strong and clear, so that no doubt whatever shall remain as to the attitude of the Government at Washington upon the question.

A bill is introduced in Congress prohibiting the master of any foreign vessel to use the American flag for the purpose of disguising the nationality of his vessel, and providing severe penalties, including the confiscation of the vessel whenever it may be found in American waters. It is probably not necessary nor opportune to press this bill to passage at this moment. Owing to the strained conditions of war, it is probably better to manage the question by diplomacy instead of legislation right at the present time. But at some appropriate time the bill should be passed.

We find a curious development of the law of nations upon the use of flags in warfare, having reference to whether the conflict is upon land or upon the sea. More than half a century ago all civilized nations provided in their rules of warfare that nothing but the flag of the nation actually in conflict should be used in war upon land, and that has been our law ever

since 1863. The instructions to the Army in 1863 contained this paragraph:

The use of the enemy's national standard flag or other emblem of nationality for the purpose of deceiving the enemy in battle is an act of perfidy by which they lose all claim for protection under the laws of war.

The same is the law of Great Britain and other European countries when fighting upon land; but by reason of a curious anomaly, which is understood only when you look into it carefully, the use of a foreign flag as a ruse has been allowed on the sea. Of course land warfare has always been a hand-to-hand combat, and therefore the need of fairness, even in war, has always been recognized on land. On the other hand, battles on the sea until recently have been of a very different character. But now as soon as a vessel may come in sight over the horizon a modern gun may destroy it; and recently with the use of the torpedo, and particularly now with the use of the submarine, the whole damage may be done in an instant. The reason for any different rule on land and sea has therefore disappeared.

The submarine keeps out of sight. A single shot from a hostile ship might destroy it. It can not expose itself close enough to make a minute examination of its enemy, or the whole advantage of warfare would be gone. It obtains its information as to the nationality of a ship from the flag it flies, and if it is a ship of a belligerent power it lays its plan to destroy it, and that is its purpose. Therefore any nation that has afloat on the high seas either a warship or a merchant marine is vitally interested in the integrity of its emblem of nationality.

At our War College, in Newport, in 1906, the advanced thought on this subject was formulated and embodied in their report; and I will read from the recommendation of our military experts upon what should be the custom at sea as well as upon land:

It is now generally considered that a neutral has an exclusive right to the use of his own flag and the right to prescribe under what conditions it may be used. A neutral would seem to be acting reasonably in demanding that his national emblem shall not be used by a belligerent to cover any act which may work injury to the other belligerent which, as regards the neutral, is a friendly state. While the practice has hitherto been tolerated, it seems to be an infringement of the natural rights of the neutral state. It may also work hardship for a neutral vessel; for when the use of its colors is permitted to either belligerent it can not surely establish its identity by raising its national flag. Such standards of action have long been eliminated from land warfare, and its continuance on the sea is hardly in accord with the standard of fair dealing which generally obtains in naval warfare.

Dr. Taylor in his American work on international law says:

At sea as on land, the use of false colors in war is forbidden. When a vessel is summoned to lie to, or before a gun is fired in action, the national colors should be displayed. And yet it is lawful to use false colors as a ruse, as Nelson did while he lay off Barcelona, for a long time showing the French flag, with the object of drawing out the ships of Spain, then allied with France.

It will be observed that the use of another flag by Nelson, under these circumstances, was upon a battleship, and he used the flag of a belligerent ally for the purpose of deceiving the enemy.

Calvo, a French author, in his work on international law has this to say:

The flag is the visible sign of the national character of a ship. Each State has its own colors, under which its nationals sail, and which can not be used without its permission.

The assumption of a flag of a foreign State without its authorization is considered as a violation of international law, as a device both fraudulent and injurious to the honor of such State. Both the State whose flag is wrongfully used and that in regard to which the use of the false flag is made have the right to demand the punishment of the guilty persons and, according to circumstances, to punish them themselves.

It is significant that this sensible doctrine is from a citizen of France, a nation allied with Great Britain in the present war. It is not believed that the use of neutral flags upon merchant vessels has ever been generally countenanced by maritime powers, and that their use by war vessels is not in accord with the enlightened thought of our twentieth-century civilization.

I think it will appear upon the most casual consideration that a failure to protest against the unwarranted use of the national colors would be a tacit consent to their use. It would be so interpreted by the other belligerent powers and as a practical favoritism to the nation whose citizens undertake to deceive the enemy by the use of a flag of a neutral power.

If Great Britain could assume the flag of the American merchant marine for her craft, the merchant marine of any other country could do the same; and if the belligerent countries can fly the American colors over their vessels, the neutral powers can do the same, and our flag would become an object of disrespect throughout the world.

If we allow the merchant marine of belligerent countries to fly our flag to deceive their enemies, it will soon cease to afford protection to American citizens and to the American merchant marine. When the American flag floats over a ship at sea it should mean that the ship, its passengers, its crew, and cargo will be protected to the last limit of American power.

We use a flag. What does it mean? It means American sovereignty, and it will be defended in connection with all that American sovereignty signifies.

The circumstance that citizens of the United States were traveling on the *Lusitania* does not alter the situation in any degree. Persons and residents of the United States in time of war who desire to go to foreign countries and, instead of embarking on American ships or upon ships of some neutral country, embark upon a boat of any belligerent nation, do so with full knowledge of all the contingencies and extra hazards that apply to conditions of war.

By what I have said I do not mean to intimate that there is any lessening whatever of the right of an American citizen anywhere in the world to be protected by the American flag. If the *Lusitania* had been in danger of destruction—which I know not—the American citizens aboard that vessel might have gathered in a group and raised the American flag themselves, as indicating by that visible emblem that they were citizens of the United States and that they desired the protection of the American Nation.

That would have been no violation of any rule of war or any rule of peace. In a foreign country an American citizen may raise the American flag to show that he is an American citizen and that he expects to obtain its protection, and his right to do so would be recognized by the laws of nations.

Of course, in order to preserve our neutrality upon the difficult questions arising during the progress of this war, it is essential that we keep ourselves within the recognized principles of international law. International law is not an exact science. Furthermore it is a science of slow growth. The law can not be made by one nation, but by the assent of all nations. While the discontinuance of the use of neutral flags in naval warfare has not been agreed to by all nations, it is universally recognized that the flag is the national property of the nation that selects it, and it would be a distinctly unfriendly act to use our national colors contrary to our expressed wishes and desires.

Now, I want to emphasize again the statement that I made earlier in this address. In my judgment, if we permit any of these belligerent nations indiscriminately to use the American flag in order to disguise the actual nationality of their ships, it will inevitably lead us into serious international difficulties, even if it does not lead us into actual participation in this war.

Nothing that I have said is intended in a spirit of criticism of the administration. I realize that in time of war the difficulty of sailing between Scylla and Charybdis, in the dangers that beset us, is very great, and I would not have anything that I might say embarrass the administration in any degree. Our President is meeting the grave responsibilities that rest upon the Executive in these trying times with great patience and patriotism. But I have desired to say that the rules of nations, as recognized by advanced international thought upon the subject, consider it as much an act of perfidy to deceive in naval warfare as in war upon the land and as to this precise question of the right to use the flag of a neutral nation. And I say, furthermore, that the right of each nation to say how its flag shall be used is recognized everywhere. And in the next place, and finally, unless we do prescribe how our flag may be used, if we permit it to be used by belligerent nations indiscriminately as a means of disguise, we not only imperil our own sea craft, but we thereby, in my opinion, desecrate the flag, and the ultimate result would be that it would become a byword between the belligerent powers as well as among neutral powers everywhere.

What are we going to do about it? I will tell you what ought to be done: First, make clear and strong our national protest against the unwarranted use of the American flag; second, paint our national colors in bold design on the hull of every American ship that sails the high seas. This could not be mistaken and would not be counterfeited. If these two things are done promptly, all difficulty and embarrassment will disappear.

One of the biggest problems in statesmanship is to teach nations to behave as well as men. By the ordinary standards of individual conduct this whole horrible European war is a disgrace and a libel on civilization. When men disagree they must settle their disagreements peaceably or by appeal to a court of justice or lose the respect of decent men. Diplomacy until within a generation or two was the refined art of successful prevarication. The man who could lie best and remain a gentleman was in demand. Diplomacy has improved, and the United States has led in the effort to apply the principles of business honesty to international relations.

Our Government will not tolerate deception or double-dealing in international negotiations. Let us insist upon the integrity of our national colors, and that they shall not be used as a disguise or instrument of deceit. Our national emblem should be as inviolate as our national honor.

Old Glory is deserving of our veneration and regard. This was the flag of Washington, and brought hope and cheer throughout the long winter at Valley Forge. It waved over the birth of the Republic. Lincoln beheld its stars and stripes and was strengthened in his mighty task—the preservation of a people's Government. For a century and more it has invited to our shores the liberty-loving races of the world, and under its ample folds they have found safety and freedom and opportunity. Among the nations it has been the symbol of integrity, of independence, and of national honor. May it continue to fulfill this high mission among the nations.

While jealous of the good name and respect for our flag abroad, let us not be unmindful of our obligations to the national colors at home. The flag should never be used as a device of business or commercialism. It should be displayed generally by loyal citizens on national holidays. It should float over every public building and every schoolhouse. I would have every public school and every college a school of patriotism. I would perpetuate all that is best and noblest in our American institutions until the proudest boast of civilized man all over this round world shall be, I am an American citizen.

Woman Suffrage.

EXTENSION OF REMARKS

OF

HON. JOHN E. RAKER,

OF CALIFORNIA,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, January 12, 1915.

The House had under consideration House resolution 703, providing for the consideration of House joint resolution 1, proposing an amendment to the Constitution of the United States extending the right of suffrage to women.

Mr. RAKER. Mr. Speaker, this is not a new question. The same arguments made here to-day were made in the State of California 20 years ago, opposing the submission of an amendment to the people of that State, and the same argument has been made in every State against the submission of the question to the voters. A constitutional amendment giving suffrage to women in 1889 was submitted in California, and the State voted against it. Men ridiculed it; men were afraid and voted it down. In 1911 we saw the same question submitted to the people of California, and at a special election in 1911, when that question, and that alone, was submitted, it carried. In the two following elections we saw and we heard the same men who had for years made the same argument that is being made here to-day stand upon the platforms, going before the people, pleading for their votes, both men and women, pleading for their suffrage, claiming that they were the simon-pure original suffragists, and it will be the same way with the Members of this House. In four years from now they will be coming from under the cover and saying that while they did not talk upon the floor of the House, they voted. They did not understand the question, and therefore they were at heart in favor of submitting this question to the American people of all the States that they might have a chance to pass upon it.

The argument which is now made against the right of women to vote—that the home would not be provided for, that the conditions surrounding the booth are objectionable, that there would be disruption in families, that women would not use their right to vote—and every other argument they have made here to-day and that has been put forth by those who are opposed to woman suffrage has been proven without foundation in fact in every State where it has been exercised and the women have the right to vote. There is no question of politics in this matter. Many of the States elect their judiciary on a nonpartisan ticket. Many of them elect their county officers on a nonpartisan ticket. Practically all the cities in the land to-day are electing their officers on a nonpartisan ballot. One-half of the best part of the American blood and brains is being deprived of a participation in electing a proper judiciary, is being deprived of the right to vote for the proper county officials, is being deprived of the right to vote for the municipal officers who exercise and control those things that pertain to the home. Better sanitary laws, better conditions for children, better schools, and everything that is near and dear to the mother's heart are involved in these municipal elections. And I ask you men to-day, Can there be any just cause, can there be any just reason, to prohibit the women to whom you turn your children over to be trained so that they will go out as educated men and prepared for the trials of life from voting? You say to her that she is able to send your boy along the right road of life; that she is willing to and can give him proper instructions that he may be able to attend the grammar school and the high schools and the higher institutions of learning, so that he may become fully equipped and qualified to perform his duty as an American citizen; yet you say she is not qualified to participate in electing officers and assisting in making the laws under which such institutions and our Government—municipal, county, State, and National—exists. This is wholly wrong from every viewpoint. Why, there is no better evidence of the right of women to vote and their ability to exercise the ballot wisely than has been evidenced by personal, practical experience in our State. We see the election booths in better shape and we see the election carried on under better conditions. One of the impressive things of the present legislative era is the rapid strides made by the cause of woman suffrage in the big States of the East. New York, New Jersey, Pennsylvania, and Massachusetts have decided to give the people an opportunity to vote on the suffrage question.

In some of these States a year or two ago all attempts to get legislative action met with complete failure. In all these States suffrage propositions have been voted down.

The change in sentiment on this question is due to the fact that suffrage is no longer a matter of theory. Half a score of States have given the ballot to women, and in these none of the horrible things that the foes of suffrage have predicted have taken place.

Women have not been made unwomanly by voting. Their homes have been just as well cared for as have the homes of women in the States where women do not vote. The business of government has been carried on as well or better than before the women became voters.

While the fact that the people are to have a chance to vote on suffrage in these and some other States does not mean that the women will secure the vote in all of them, the change in the opinions of the legislators is a good indication of a change in the views of the people.

Suffrage is moving on with increasing speed and apparently the time is not far distant when the States in which women are denied a share in the government will be the exception.

While a candidate for Congress in 1910 the congressional committee, National American Woman Suffrage Association, submitted to me as such candidate a list of question on my attitude on woman's suffrage. Those questions and my answers thereto are as follows:

[Congressional committee, National American Woman Suffrage Association, headquarters 1823 H Street NW., Washington, D. C.]

1. Are you in favor of full suffrage for women?
Answer. Yes.
2. Are you in favor of municipal suffrage for women?
Answer. Yes.
3. Are you in favor of school suffrage for women?
Answer. Yes.
4. Are you in favor of suffrage in any form for tax-paying women?
Answer. Answered above in full.
5. Are you opposed to any form of suffrage for women?
Answer. No.
6. If in favor of full suffrage for women, do you approve of an amendment to the United States Constitution in effect as follows: "The rights of citizens of the United States to vote shall not be denied or abridged by the United States or by any State thereof on account of sex"?
Answer. Yes.
7. If you do not favor an amendment to the National Constitution, would you support a woman-suffrage amendment to your State constitution or to city charters in your State?
Answer. Yes; give our mothers and sisters their rights.
Name: JOHN E. RAKER.
Address: Alturas, Cal.

On January 5, 1912, I introduced House joint resolution 201, Sixty-second Congress, second session, proposing an amendment to the Constitution of the United States extending the right of suffrage to women, as follows:

Joint resolution proposing an amendment to the Constitution of the United States extending the right of suffrage to women.

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled (two-thirds of each House concurring therein), That the following article is proposed as an amendment to the Constitution of the United States, which, when ratified by the legislatures of three-fourths of the States, shall be valid to all intents and purposes as a part of the Constitution:

"ARTICLE XVIII.

"SECTION 1. The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State thereof on account of sex.

"SEC. 2. Congress shall have power by appropriate legislation to enforce the provisions of this article."

This House joint resolution was referred to the Committee on the Judiciary of the House, and during the session of Congress I appeared before the committee and urged favorable report of the same.

Again, on April 7, 1913, I introduced House joint resolution 31, Sixty-third Congress, first session, which was the same as House joint resolution 201 of the Sixty-second Congress. House joint resolution 31 is as follows:

Joint resolution proposing an amendment to the Constitution of the United States extending the right of suffrage to women.

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled (two-thirds of each House concurring therein), That the following article is proposed as an amendment to the Constitution of the United States, which, when ratified by the legislatures of three-fourths of the States, shall be valid to all intents and purposes as a part of the Constitution:

"ARTICLE XVIII.

"SECTION 1. The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State thereof on account of sex.

"SEC. 2. Congress shall have power by appropriate legislation to enforce the provisions of this article."

During the consideration of this question in the third session of the Sixty-third Congress, before the Judiciary Committee of the House, my resolution, as well as resolutions by Mr. TAYLOR of Colorado and Mr. HAYDEN, having for their objects the same purpose as House joint resolution 1, were considered, and were all presented to the House upon the same day. The committee in its wisdom saw fit to report House joint resolution No. 1 instead of No. 31. Results are what we are after, and I am therefore heartily in favor of the passage of House joint resolution 1.

One of the unfortunate conditions surrounding the proper presentation of the resolution now under consideration by this House is that no proper or complete hearing has ever been had by a committee of this House having the subject under consideration.

I mean by that that but an hour or two has been granted each time, when a few general statements have been made, but no thorough, deep, and broad investigation had, as the importance of the subject so justly demands. The subject being world-wide in operation in a number of the States, as well as in foreign countries, the benefit and facts surrounding the use of the ballot by women should have been fully, fairly, and thoroughly presented to a committee of the House having jurisdiction and with ample time to investigate and report. This, as I have before said, has not been done.

To remedy this condition, on April 7, 1913, I introduced House resolution 22, Sixty-third Congress, first session, having for its object the amendment of the rules of the House and providing for a committee on woman suffrage, to consist of 13 members, and directing that all proposed action touching the subject of woman suffrage should be referred to such committee. The resolution is as follows:

Resolved, That the rules of the House of Representatives be amended as follows:

Amend Rule X by adding thereto a new subdivision, to be numbered "56," to read as follows:

"56. On woman suffrage, to consist of 13 members."

And to amend Rule XI thereof by adding thereto a new subdivision, to be numbered "56," and to read as follows:

"56. All proposed action touching the subject of woman suffrage, to the committee on woman suffrage."

While this resolution has been to some extent considered by the Committee on Rules, and otherwise, I am sorry to say that it was not made a part of the Rules of the House. It is Democratic doctrine, and I am satisfied that at the meeting of the Sixty-fourth Congress the Rules of the House will be amended so as to provide for a committee on woman suffrage.

Hundreds of organizations have indorsed woman suffrage, not in one State alone, but in every State in the Union. Equal-suffrage planks have been adopted in more party platforms by all parties during the last year than ever before.

Suffrage amendments as they now stand in the constitutions of the several States which have equal suffrage in this country are as follows:

ARIZONA—WORDING OF AMENDMENTS ENFRANCHISING WOMEN.

Be it enacted by the people of Arizona, That sections 2 and 15 of article 7 of the constitution of Arizona be, and are hereby, amended to read as follows, to wit:

SEC. 2. No person shall be entitled to vote at any general election, or for any office that now is or hereafter may be elective by the people, or upon any question which may be submitted to a vote of the people, unless such person be a citizen of the United States of the age of 21 years or over and shall have resided in the State one year immediately preceding such election. The word "citizen" shall include persons of the male and female sex.

The rights of citizens of the United States to vote and hold office shall not be denied or abridged by the State or any political division or municipality thereof on account of sex, and the right to register, to vote, and to hold office under any law now in effect or which may hereafter be enacted is hereby extended to and conferred upon males and females alike.

No person under guardianship, non compos mentis, or insane shall be qualified to vote at any election, nor shall any person convicted of treason or felony be qualified to vote at any election unless restored to civil rights.

SEC. 15. Every person elected or appointed to any office of trust or profit under the authority of the State or any political division or any municipality thereof shall be a qualified elector of the political division or municipality in which said person shall be elected or appointed.

Filed July 5, 1912.

SIDNEY P. OSBORN, *Secretary of State.*

CALIFORNIA—RIGHT OF SUFFRAGE—WHO MAY VOTE, WHO MAY NOT.

SECTION 1. Every native citizen of the United States, every person who shall have acquired the rights of citizenship under or by virtue of the treaty of Queretaro, and every naturalized citizen thereof who shall have become such 90 days prior to any election, of the age of 21 years, who shall have been resident of the State one year next preceding the election, and of the county in which he or she claims his or her vote 90 days, and in the election precinct 30 days, shall be entitled to vote at all elections which are now or may hereafter be authorized by law: *Provided*, That no native of China, no idiot, no insane person, no person convicted of any infamous crime, no person hereafter convicted of the embezzlement or misappropriation of public money, and no person who shall not be able to read the Constitution in the English language and write his or her name shall ever exercise the privileges of an elector in this State: *Provided*, That the provisions of this amendment relative to an educational qualification shall not apply to any person prevented by a physical disability from complying with its requisitions, nor to any person who now has the right to vote, nor to any person who shall be 60 years of age and upward at the time this amendment shall take effect.

(Amendment adopted Oct. 10, 1911.)

IDAHO—AMENDMENT NO. 2, ARTICLE 6.

Except as in this article otherwise provided, every male or female citizen of the United States, 21 years old, who has actually resided in this State or Territory for six months, and in the county where he or she offers to vote 30 days next preceding the day of election, if registered as provided by law, is a qualified elector; and until otherwise provided by the legislature, women who have the qualifications prescribed in this article may continue to hold such school offices and vote at such school elections as provided by the laws of Idaho Territory.

Adopted November 3, 1896.

KANSAS—HOUSE CONCURRENT RESOLUTION NO. 3, GRANTING EQUAL RIGHTS AND PRIVILEGES TO WOMEN.

Be it resolved by the Legislature of the State of Kansas (two-thirds of the members elected to each house thereof concurring therein), That the following proposition to amend the constitution of the State of Kansas be hereby submitted to the qualified electors of the State for their approval or rejection, namely:

SECTION 1. The rights of citizens of the State of Kansas to vote and hold office shall not be denied or abridged on account of sex.

SEC. 2. This proposition shall be submitted to the electors of this State at the election for representatives to the legislature in the year 1912. The amendment hereby proposed shall be known on the official ballot by the following title: "Amendment to the constitution granting equal rights and privileges to women"; and the vote for or against such amendment shall be taken as provided by law.

SEC. 3. This amendment, if adopted, shall be known as section 8 of article 5 of the constitution of the State of Kansas.

SEC. 4. This resolution shall take effect and be in force from and after its publication in the statute book.

Passed the house February 7, 1911.
Passed the senate February 8, 1911.
Approved February 9, 1911.
Adopted November 5, 1912.

OREGON—SUFFRAGE AMENDMENT.

[On official ballot, Nos. 300 and 301.]

Section 2 of article 11 of the constitution of the State of Oregon shall be, and hereby is, amended to read as follows:

"SEC. 2. In all elections not otherwise provided for by this constitution every citizen of the United States, of the age of 21 years and upward, who shall have resided in the State during the six months immediately preceding such election, and every person of foreign birth of the age of 21 years and upward, who shall have resided in this State during the six months immediately preceding such election, and shall have declared his or her intention to become a citizen of the United States one year preceding such election, conformably to the laws of the United States on the subject of naturalization, shall be entitled to vote at all elections authorized by law."

Adopted November 5, 1912.

UTAH—ARTICLE 55—ELECTIONS AND RIGHT OF SUFFRAGE.

SECTION 1. Equal political rights. The rights of citizens of the State of Utah to vote and hold office shall not be denied or abridged on account of sex. Both male and female citizens of this State shall enjoy equally all civil, political, and religious rights and privileges.

SEC. 2. Qualifications to vote. Every citizen of the United States, of the age of 21 years and upward, who shall have been a citizen for 90 days, and shall have resided in the State or Territory one year, in the county four months, and in the precinct 60 days next preceding any election, shall be entitled to vote at such election, except as herein otherwise provided.

WASHINGTON—ARTICLE 6—ELECTIONS AND ELECTIVE RIGHTS.

Article 6 was amended at the general election held November 8, 1910, by striking out all of sections 1 and 2 and inserting in lieu thereof the following, to be known as section 1:

"SECTION 1. All persons of the age of 21 years or over, possessing the following qualifications, shall be entitled to vote at all elections: They shall be citizens of the United States; they shall have lived in the State 1 year, and in the county 90 days, and in the city, town, ward, or precinct 30 days immediately preceding the election at which they offer to vote; they shall be able to read and speak the English language: *Provided*, That Indians not taxed shall never be allowed the elective franchise: *And further provided*, That this amendment shall not affect the rights of franchise of any person who is now a qualified elector of this State. The legislative authority shall enact laws defining the manner of ascertaining the qualifications of voters as to their ability to read and speak the English language, and providing for punishment of persons voting or registering in violation of the provisions of this section. There shall be no denial of the elective franchise at any election on account of sex."

WYOMING—ARTICLE 6—SUFFRAGE.

Equal rights.

SECTION 1. The rights of citizens of the State of Wyoming to vote and hold office shall not be denied or abridged on account of sex. Both male and female citizens of this State shall equally enjoy all civil, political, and religious rights and privileges. (McKinney *v.* State, 3 Wyo., 719.)

Qualifications of electors.

SEC. 2. Every citizen of the United States of the age of 21 years and upward who has resided in the State or Territory 1 year and in the county wherein such residence is located 60 days next preceding any election shall be entitled to vote at such election, except as herein otherwise provided.

Adopted November 5, 1889.

ALASKA—AN ACT TO EXTEND THE ELECTIVE FRANCHISE TO WOMEN IN THE TERRITORY OF ALASKA.

Be it enacted by the Legislature of the Territory of Alaska:

SECTION 1. That in all elections which are now or may hereafter be authorized by law in the Territory of Alaska, or any subdivision or municipality thereof, the elective franchise is hereby extended to such women as have the qualifications of citizenship required of male electors.

THE WOMAN SUFFRAGE LAW.

[Passed by Illinois Legislature, 1913.]

SECTION 1. All women, citizens of the United States, above the age of 21 years, having resided in the State 1 year, in the county 90 days, and in the election district 30 days next preceding any election therein, shall be allowed to vote at such election for presidential electors, member of the State board if equalization, clerk of the appellate court, county surveyor, members of board of assessors, members of board of review, sanitary district trustees, and for all officers of cities, villages, and towns (except police magistrates), and upon all questions or propositions submitted to a vote of the electors of such municipalities or other political divisions of this State.

SEC. 2. All such women may also vote for the following township officers: Supervisor, town clerk, assessor, collector, and highway commissioner, and may also participate and vote in all annual and special town meetings in the township in which such election district shall be.

SEC. 3. Provides for separate ballots and ballot boxes and for registration.

In presenting the laws enfranchising women in America I have secured through the good offices of the National American Woman Suffrage Association the laws of foreign countries, as far as enacted, and now enforced, giving women the right to vote, namely:

COMMONWEALTH OF AUSTRALIA.

[No. 8, of 1912.]

An act to provide for a uniform Federal franchise (assented to 12th of June, 1912).

Subject to the disqualifications hereafter set out, all persons not under 21 years of age, whether male or female, married or unmarried—

(a) Who have lived in Australia for six months continuously; and

(b) Who are natural born or naturalized subjects of the King; and

(c) Whose names are on the electoral roll for any electoral division, shall be entitled to vote at the election of members of the senate and the house of representatives.

No person who is of unsound mind, and no person attainted of treason or who has been convicted and is under sentence or subject to be sentenced for any offense punishable under the law of any part of the King's dominions by imprisonment for one year or longer shall be entitled to vote at any election of members of the senate or the house of representatives.

SOUTH AUSTRALIA.

[No. 613.]

An act to amend the constitution (reserved Dec. 21, 1894).

The right to vote for persons to sit in Parliament as members of the legislative council and the right to vote for persons to sit in Parliament as members of the house of assembly are hereby extended to women.

Women shall possess and may exercise the rights hereby granted, subject to the same qualifications and in the same manner as men. All constitution and electoral acts and all other laws are hereby amended so far as may be necessary to give effect to this act.

WESTERN AUSTRALIA.

[No. 26, of 1907.]

An act to regulate parliamentary elections (assented to Dec. 20, 1907).

Part 3, enrollment.

Division 1, qualifications of electors.

17. Subject to the disqualifications hereinafter set out, every person not under 21 years of age who—

(a) Is a natural born or naturalized subject to His Majesty; and

(b) Has resided in Western Australia for six months continuously; and

(c) Has resided in the district for which he claims to be enrolled as an elector, for a continuous period of one month immediately preceding the date of his claim, shall be entitled, subject to the provisions of this act, to be enrolled as an elector, and when enrolled, to vote at the election of a member of the legislative assembly of that district.

(3) Any member of the legislative assembly and the wife of any member of the legislative assembly may claim to be enrolled for the district represented by such member, and when enrolled shall be deemed to reside in such district.

The constitution's act amendment act, 1899, gave votes to women.

VICTORIA.

ADULT SUFFRAGE ACT, 1908.

SEC. 3. (1) In section 43 and all subsequent sections in part 3, and in section 29 of the constitution act amendment act, 1890, and in [here follow a list of the other election acts]—

(a) The word "male" wherever it occurs in reference to electors or to procedure for becoming electors shall be repealed.

(b) The word "person" wherever it occurs in reference to electors and to procedure for becoming electors shall be deemed to include women whether married or single; and

(c) Generally all words importing or applicable to the masculine gender shall, where used in reference to electors or to procedure for becoming electors, be deemed to include females.

2. In any certificate in the form contained in the nineteenth schedule to the said first-mentioned act for the word "manhood," wherever it occurs, the word "womanhood" shall be substituted when an elector's right is issued to a woman whether married or single.

4. Where in any act whatsoever, whether passed before or after the commencement of this act, any reference is made to persons, voters, or electors entitled, claiming, or attempting to vote or become electors (as the case may be) or voting at parliamentary elections, such reference shall so far as is consistent with this act be deemed and taken to extend to women whether married or single, and no female elector shall be disqualified from voting under the name appearing on the roll because her surname has been changed by marriage.

5. No married woman shall by reason of coverture only be disqualified from being enrolled or be deemed incapable of exercising any rights with respect to voting which are conferred by this act.

QUEENSLAND.

THE ELECTIONS ACT 1885 TO 1905.

Part 2. Qualifications and disqualifications of electors.

Subject to the disqualifications hereafter set out, all persons not under 21 years of age, whether male or female, married or unmarried—

(a) Who have resided in Queensland for 12 months continuously; and

(b) Who are natural-born subjects of the King; and

(c) Whose names are on the electoral roll for an electoral district of Queensland, shall be entitled to vote at the election of members of the assembly for such electoral district.

DISQUALIFICATIONS.

7. No person who is of unsound mind, and no person attainted of treason or who has been convicted and is under sentence or subject to be sentenced for any offense punishable under the law of any part of the King's dominions by imprisonment; or during six months immediately preceding the sitting of the registration court or the holding of the election has been convicted of being an habitual drunkard, or has been convicted of drunkenness 12 times, or has been convicted of being an idle and disorderly person, or an incorrigible rogue, or a rogue and vagabond, or has against him an unsatisfied order of any court for the maintenance of his wife or children (whether legitimate or illegitimate), or has been convicted of having committed an aggravated assault upon his wife within one year, shall be entitled to be placed upon any electoral roll or to vote at any election of members of the assembly.

VOTING BY POSTAL BALLOT.

Any female elector who desires to vote through the post office and any male elector who on polling day will be absent from the district for which he is enrolled and who desires to vote through the post office may not later than the second day preceding polling day apply to the returning officer for a postal ballot certificate.

NEW SOUTH WALES.

THE WOMEN'S FRANCHISE ACT 1902.

The right to vote at elections of members of the legislative assembly is hereby conferred upon women. And for that purpose the expression "male person" in the parliamentary electorates and elections act of 1893 shall be read "male or female person" and the word "son" in the definition of natural-born subject in section 4 of that act shall be read "son or daughter," and all alterations necessary to carry out the provisions of this section shall be made in the form of any documents as prescribed in that act: *Provided*, That the right so conferred shall not be exercised until the general election next happening after the commencement of this act.

4. Nothing in this act shall be taken to enable or qualify a woman to be nominated as a candidate at any election or to be elected as a member.

TASMANIA.

The constitution act 1903 first enfranchised women. The constitution act amendment act of 1907 provided: Subject to the disqualifications in this act set out all persons not under 21 years of age, whether male or female, married or unmarried (1) who have lived in Tasmania for six months continuously and (2) who are naturalized subjects of the King and (3) whose names are on the electoral roll for any assembly district shall be entitled to vote at the election of members of the assembly. No person who is of unsound mind or who is in receipt of aid from any public charitable institution except as a patient under treatment from accident or disease at a hospital, and no person attainted of treason or who has been convicted and is under sentence or subject to be sentenced for any offense punishable under the law of any part of the King's dominions by imprisonment for one year or longer shall be entitled to vote at any election of members of the assembly.

NEW ZEALAND.

The electoral act of 1893 first enfranchised women.

The interpretation clause contains the following provision:

Clause 11. * * * "Persons" includes woman.

Clause 6. The members of the house of representatives shall be chosen in every electoral district appointed for that purpose by the votes of the inhabitants of New Zealand who shall possess within the district the qualifications defined by the act, that is to say:

Subsection 1 gave freehold qualifications.

In 1896 nonresidential qualification was abolished.

Subsection 2. Every person of the age of 21 years and upward who has resided for one year in the colony and in the electoral districts for which he claims to vote during the three months immediately preceding the registration of his vote and is not registered in respect of a freehold or residential qualification for the same or any other district is entitled (subject to the provisions of this act) to be registered as an elector and to vote at the election of members for such district for the house of representatives.

Subsection 9. Every man registered.

No woman, although duly registered as an elector, shall be capable of being nominated as a candidate or of being elected a member of the house of representatives or of being appointed to the legislative council, and every nomination paper of a woman as a candidate shall be absolutely void and of no effect and shall be rejected by the returning officer without question.

FINLAND.

The vote for the Landtag is given to every woman who is a Finnish subject and is 24 years of age, unless (a) she is under guardianship; (b) she has not been on the census list for the last three years; (c) she has neglected to pay taxes; (d) she has been in regular receipt of poor-law relief; (e) her property is in the hands of creditors; (f) she is living the life of a vagabond; (g) she is convicted of such acts as

render her undesirable in public opinion to vote; (h) she has bought or sold or tried to sell a vote, or voted in different places, or used violence or threats at the polls.

Everyone who has a vote is eligible as member of the Landthing, independent of residence.

NORWAY.

Norway's franchise law, amended 1910.

The right to the political vote is possessed by all women who are Norwegian subjects and over the age of 25, if they have lived in the country five years and paid taxes to State or commune for the previous year and have an income of 400 kroners per annum in town and 300 kroners in country, or if their husbands have paid such taxes. Everyone with the above-stated income must pay a tax to the community not under 50 ore and not exceeding 2 kroners, even if the revenue should not claim such a tax.

SUSPENDED FROM ELECTORAL RIGHTS.

All persons are suspended from electoral rights if (a) they are under arrest for a criminal offense; (b) they are under guardianship; (c) they are bankrupt; (d) if they are in receipt of money poor relief for self or husband or child under 15 years of age.

FORFEITURE OF ELECTORAL RIGHTS.

Electoral rights are forfeited by persons (a) convicted of criminal offenses; (b) naturalized in a foreign country; (c) who have been guilty of buying or selling a vote or by voting in more than one constituency.

Any voter prevented from voting in person by a legitimate cause can do so in writing, but the reason given for absence must be confirmed by two witnesses. Legitimate causes for voting in writing are illness, natural obstruction (snow), old age, accident, confinement in childbirth, nursing babies, or taking care of small children or infirm people.

Candidates for election must not be more than 30 years of age, must have lived in the country 10 years and have a vote in the constituency which elects them. Anyone elected must serve as representative in the Storthing, unless she can give legitimate reason for refusing.

EQUAL SUFFRAGE IN OPERATION IN CALIFORNIA.

Desiring to know the operation of equal suffrage in California, questions were submitted and an organization having gone into the matter fully answering certain questions in detail, showing the operation of equal suffrage in the State of California.

It is felt in the present condition of the woman suffrage question it would be of interest to know what were the causes which led to its introduction, the conditions under which it is granted, and the results which have followed from it in your State.

In order that we may have the benefit of first-hand information it is suggested that you should give to us an account of this kind. If you are willing to assist in this way, will you kindly put your account in the form of answers to the following questions:

1. What were the reasons which led to the grant of the vote to women?

(a) Was the proposal a party question? If so, which party favored and which opposed it?

Answer. It was not a party measure. The progressive wings of the Democratic and Republican Parties and the Socialist Party favored it. Reactionary wings opposed.

(b) Did any female suffragists resort to "militant" tactics? If so, what effect was produced?

Answer. No; not even a procession was indulged in.

(c) Where did the strength of the movement, and of the opposition to it, in any, lie?

Answer. See (a), and add liquor, vice, and ultraconservative men and women were actively opposed. Protected women and timid ones selfishly withheld their support from the measure. Women's clubs generally throughout the country did splendid educational work and furnished leaders for suffrage.

2. What are the conditions in which women can obtain the vote?

(a) Are the qualifications the same for men and women?

Answer. Yes.

(b) What is the proportion of men to women at present on the register?

Answer. The State has made no report and registration is not segregated.

(c) Are women eligible for the legislature and Congress?

Answer. Yes; but so far they have not been candidates for such offices.

3. How do women exercise the vote?

(a) What percentage of women voters go to the polls? How does this compare with men?

Answer. See statistics for Los Angeles and Berkeley, hereto attached. No other statistics.

(b) Do women voters as a rule join or follow the existing political parties; or has there been any tendency to form new parties appealing especially to women voters? Has the grant of the vote had any, and if so, what effect on the comparative strength of the various parties?

Answer. There has been no tendency to form a woman's party. A new national party, the Progressive, formed one year ago, offers a social welfare program that appeals to women. There is more than a tendency in all parties to offer the platforms that women demand.

(c) Do married women voters as a rule vote as their husbands do, or not?

Answer. There is no rule. Some do and some do not.

(d) Has the female vote had any effect on the character of candidates for municipal or State offices?

Answer. It is impossible to say as two years have not yet passed since the vote was granted.

4. What effect, if any, has the grant of the vote had on the position of women?

(a) Has it caused any ill feeling between men and women or any dissensions in families?

Answer. If it has the skeletons are still in the closet. The women who do active political work are single women or those whose children are grown.

(b) Has it increased the interest taken by women in politics? If so has it impaired their usefulness in the home?

Answer. Women certainly take a more general interest in politics and no change is apparent in the home. Sensible women are still sensible and maintain their sense of proportion; silly women are still silly.

5. Is there any agitation for the repeal of this franchise?

Answer. No.

6. What is your general impression of the effect produced by this change?

Answer. That women are gaining in self-respect and ceasing to be the rebels that they were before they were allowed to express themselves politically and that they are rapidly evolving a real social conscience; that boys are beginning to recognize that "mothers' political notions" are ideas and worthy of consideration; that the press is more respectful and that in time of campaign even reactionary newspapers become frankly suppliant; that there is a finer comradeship between men and women, and that women already command respectful attention in municipal and State affairs. A sweeping change in polling places took effect immediately, schoolhouses, halls, and tents being used instead of livery stables and barber shops.

7. What legislation dealing with the following subjects has been passed since women had the vote?

(a) The conditions of female labor.

Answer. Extension of eight-hour law into four additional industries, including student nurses in hospitals, commission on minimum wage for women and minors, with power to act.

(b) The protection of children and girls.

Answer. Improved juvenile court law. Extension of child-labor laws prohibiting all minors under 18 from working more than eight hours a day.

(c) Temperance and the regulation of the liquor traffic.

Answer. State law closing saloons from 2 to 6 a. m. Many small localities voted dry.

(d) Education.

Answer. Free textbooks and school supplies.

(e) Sanitation, including milk supply.

Answer. Defeat of pernicious bills introduced by dairy interests that would take control of supply from municipalities.

(f) Industrial arbitration.

Answer. Nothing.

(g) Pensions for widows left with children.

Answer. Bill passed granting aid to destitute children kept in homes of widowed mothers.

(h) Divorce laws.

Answer. No change.

(i) Can the influence of the female vote be traced in any acts which have been passed or referenda taken on these subjects since the grant of votes to women?

Answer. 1. A pension to public-school teachers.
2. The red-light injunction and abatement law.
3. Raising age of consent to 18 years.
4. Joint guardianship of children.
5. Bastardy bill requiring father to support child born out of wedlock.
6. Bill for a State training school for delinquent girls.

These were all passed through direct influence of the votes behind the women.

The workingman's compensation act providing insurance for injured employees was strongly indorsed by the Federation of Women's Clubs.

SUPPLEMENTARY.

Supplementing the information given in direct response to the questionnaire, the committee attached two articles which had previously appeared in these columns, relating especially to the proportions of the vote as between men and women in the Los Angeles and Berkeley municipal elections of last spring. The first of these articles, published June 21 last, is reproduced, as follows:

"It has been a more or less popular argument with opponents of woman suffrage that having once attained to the ballot women would not vote. But a more frequently used declaration was that fashionable and highly cultured women would not visit the polls, leaving that duty of citizenship to their humbler sisters. Both of these arguments seem to have been proven fallacies by the result of the recent municipal election in Los Angeles. At any rate, it was demonstrated that the women established a voting average which compares quite favorably with that of the men, this notwithstanding the fact that voting is new to women, while the men have been schooled to it through generations.

"The total registration in Los Angeles qualified for the municipal election was 171,025. The number of men registered was 97,186, or 56.9 per cent of the total. The registration of women footed up 73,839, or 43.1 per cent of the total.

"The total vote was 89,831—only 52.5 per cent of the registration.
"The vote by men was 52,731.
"The vote by women was 37,100.
"The percentage of registered men voting was 54.2.
"The percentage of registered women voting was 50.2.
"The percentage of the total vote cast by men was 58.7.
"The percentage of the total vote cast by women was 41.3.

"From these figures it will be seen that the women did their duty as citizens just about as well as did the men and, perhaps, all things considered, a little better.

"For the benefit of those who like to make deductions, we present herewith a table, classified into well-defined districts or sections of the city, showing the way the vote was cast, and the percentage made by woman voters. A study of this table will prove interesting and instructive.

"As a key for the guidance of readers not familiar with the city of Los Angeles, it may be stated that Hollywood, Westlake, Wilshire, and West Adams are rated as the so-called 'exclusive' sections, while the Highland district is also populated largely by people of the leisure class. In the other sections the population runs largely to people of smaller means and humbler social station.

"With this as a basis, you may entertain yourself for an entire evening with the figures in the table.

"Here is an interesting comparison in addition, drawn from precinct returns. In precinct 31, at Macy and Avila Streets, 144 men and 31 women voted. In precinct 32, at Amelia and Jackson Streets, 138 men and 14 women voted. In precinct 33, on North Los Angeles Street, 169 men and 6 women voted. Socially rated, these are among the humblest precincts in the city.

"Now, rake two of the 'exclusive' precincts: 451, which includes Chester Place and St. James Park—61 men and 79 women; 427, at 1627 West Seventh Street—90 men and 105 women. A conservative precinct, like 79, on West Temple Street, showed as follows: 96 men and 112 women. At Wilmington, precinct 280, 55 of the 63 registered women voted.

Table showing how men and women voted.

Location.	Vote cast.	Men vote.	Women vote.	Women per-centage.
10 precincts in Highland Park	3,060	1,556	1,504	49
11 precincts in Hollywood	2,698	1,348	1,350	50
17precincts in Angeleno Heights	3,533	2,104	1,429	40
21precincts in East Side	5,281	3,154	2,127	40
44precincts in Boyle Heights	6,104	3,619	2,485	41
84 precincts in down town and industrial	15,734	10,907	4,827	31
24 precincts in Westlake	7,768	4,201	3,567	46
8 precincts in Edendale	2,324	1,313	1,011	43
28 precincts in Wilshire, northwest	6,685	3,706	3,079	46
61 precincts in West Adams	12,288	7,456	5,842	47
64 precincts in southwest	11,647	6,551	5,096	44
69 precincts in southeast	11,679	7,290	4,389	38
14 precincts in Wilmington-San Pedro	2,113	1,420	693	32
Total	89,831	52,731	37,100	

THE BERKELEY ELECTION.

"The report on the Berkeley election was prepared by Mrs. Inez R. Brown, assisted by Miss Harriet Stark. The following portion thereof is reproduced from the California Outlook of July 5:

"Total registration, 18,597.
"Men registered, 9,936, 53+ per cent.
"Women registered, 8,661, 46+ per cent.
"Total vote, 8,576.
"Men voted, 4,874, 56+ per cent.
"Women voted, 3,702, 43+ per cent.
"Percentage of registered men voting, 49+ per cent.
"Percentage of registered women voting, 42.7 per cent.
"Percentage of total registration voting, 46+ per cent.
"In 16 out of 32 precincts of the city practically 50 per cent or more of the registered persons are women.
"In 8 precincts, one-quarter of the city, women cast 50 per cent or more of the vote.
"The larger woman's vote was cast in precincts where the prosperous professional and business people reside.
"The smaller woman's vote was cast in the manufacturing, factory, and laboring section, notably along the water front.
"The average woman's vote was cast in the precincts where persons of modest means, clerks, and mechanics, live."

I desire to emphasize five cardinal reasons why this resolution should be passed by this House:

First. That this amendment does not directly give the franchise to women. It merely forbids any State to disfranchise because of sex, as the fifteenth amendment forbade disfranchisement because of race, color, and so forth.

It is the logical and inevitable extension of democracy.

Second. That the passage of this resolution by both branches of Congress does not make it operative until further ratified by a majority vote of the legislatures of three-fourths of all the States.

This is the careful and conservative method provided by the framers of the Constitution for its adaptation to the growing needs of the people.

Third. That this provision of the Constitution for its own amendment has been subscribed and agreed to by each and every State at entry into the Union.

Fourth. That after this amendment is passed by Congress and ratified by the legislatures it then becomes the privilege and the duty of each State legislature to fix and define the terms upon which the women of its Commonwealth may exercise the franchise.

This insures the conformity of woman suffrage to local issues and conditions, precisely in the way that manhood suffrage is regulated now to that end.

Fifth. And that, finally, the widespread, earnest, and long-continued demand for this constitutional amendment entitles the people through their respective legislatures to a voice in its consideration and decision.

WHY SHOULD WOMEN VOTE?

The reasons why women should vote are the same as the reasons why men should vote—the same as the reasons for having a republic rather than a monarchy. It is fair and right that the people who must obey the laws should have a voice in choosing the lawmakers, and that those who must pay the taxes should have a voice as to the amount of the tax and the way in which the money shall be spent.

Roughly stated, the fundamental principle of a republic is this: In deciding what is to be done, where everybody's interests are concerned, we take everybody's opinion, and then go according to the wish of the majority. As we can not suit everybody, we do what will suit the greatest number. That seems to be, on the whole, the fairest way. A vote is simply a written expression of opinion.

In thus taking a vote to get at the wish of the majority, certain classes of persons are passed over, whose opinions for one reason or another are thought not to be worth counting. In most of our States these classes are children, aliens, idiots, lunatics, criminals, and women. There are good and obvious reasons for making all these exceptions but the last. Of course, no account ought to be taken of the opinions of children, insane persons, or criminals. Is there any equally good reason why no account should be taken of the opinions of women? Let us consider the reasons commonly given, and see if they are sound.

ARE WOMEN REPRESENTED?

Women are represented already by their husbands, fathers, and brothers.

This so-called representation bears no proportion to numbers. Here is a man who has a wife, a widowed mother, four or five unmarried sisters, and half a dozen unmarried daughters. His vote represents himself and all these women, and it counts one; while the vote of his bachelor neighbor next door, without a female relative in the world, counts for just as much. Since the object of taking a vote is to get at the wish of the majority, it is clear that the only fair and accurate way is for each grown person to have one vote, and cast it to represent himself or herself.

MEN AND WOMEN DIFFERENT.

American men are the best in the world, and if it were possible for any men to represent women, through kindness and good will to them, American men would do it. But a man is by nature too different from a women to be able to represent her. The two creatures are unlike. Whatever his good will, he can not fully put himself in a woman's place, and look at things exactly from her point of view. To say this is no more a reflection upon his mental or moral ability than it would be a reflection upon his musical ability to say that he can not sing both soprano and bass. Unless men and women should ever become just alike (which would be regrettable and monotonous), women must either go unrepresented or represent themselves.

WOMEN NOT REPRESENTED IN THE LAWS.

Another proof that women's opinions are not now fully represented is the lack in many States of humane and protective legislation and the poor enforcement of such legislation where it exists; the inadequate appropriations for schools; the permission of child labor in factories; and in general the imperfect legal safeguarding of the moral, educational, and humanitarian interests that women have most at heart. In many of our States the property laws are more or less unequal as between men and women. A hundred years ago, before the equal-rights movement began, they were almost incredibly unequal. Yet our grandfathers loved their wives and daughters as much as men do to-day.

IS "INFLUENCE" ENOUGH?

If the laws are unjust, they can be corrected by women's indirect influence.

Yes; but the indirect method is needlessly long and hard. If women were forbidden to use the direct route by rail across the continent and complained of the injustice, it would be no answer to tell them that it is possible to get from New York to San Francisco by going around Cape Horn.

MOTHER AND CHILD.

The slowness with which some of the worst inequalities in the laws are corrected shows the unsatisfactoriness of the indirect way. In most States a married mother has literally no legal rights over her own children so long as she and her husband live together. Here is a case which actually happened, and which might happen to-day in 34 out of the 46 States of the Union:

A Chinaman had married a respectable Irish woman. When their first baby was three days old the husband gave it to his brother to be taken to China and brought up there. The mother, through the Society for the Prevention of Cruelty to Children, appealed to the courts. But the judge promptly decided that the husband was within his rights. He was the sole legal owner of the baby; he had the sole legal right to say what should be done with it. For more than half a century the suffragists of the United States have been trying to secure legislation making the father and mother joint guardians of their children by law, as they are by nature; but thus far the equal-guardianship law has been obtained in only 12 States and the District of Columbia. Massachusetts got it in 1902, after 55 years of effort by Massachusetts women. In Colorado, after women were given the right to vote, the very next legislature passed an equal-guardianship law—Laws of 1895, page 186.

In Massachusetts the State Federation of Women's Clubs, the Woman's Relief Corps, the State Woman's Christian Temperance Union, the Children's Friend Society, and 64 other associations united in asking for the bill. The only society of women that has ever ranged itself definitely on the wrong side of this question is the Massachusetts Association Opposed to the Further Extension of Suffrage to Women. It circulated for years, under its official imprint, a leaflet in defense of the old law which gave the husband the sole control of the children.

In Massachusetts in 1902 the laws of inheritance between husband and wife were made equal, but it had taken more than half a century of work to secure this self-evidently just measure. The experience in many other States has been similar. The roundabout way is almost always long and slow.

THE IGNORANT VOTE.

It would double the ignorant vote.

Statistics published by the National Bureau of Education show that the high schools of every State in the Union are graduating more girls than boys—some of them twice or three times as many. The whole number of boys in attendance at public high schools in the United States in 1905–6 was 305,308; of girls, 417,384. Because of the growing tendency to take boys out of school early in order to put them into business, girls are getting more schooling than boys. Equal suffrage would increase the proportion of voters who have received more than a merely elementary education.

THE FOREIGN VOTE.

It would double the foreign vote.

During the three years ending June 30, 1904, there arrived in the United States 2,223,166 immigrants. Of these only 664,527 were women, less than one-third. (Report of Commissioner General of Immigration.) There are in the United States more than three times as many native-born women (32,467,041) as there are foreign-born men and foreign-born women put together (10,341,276). (Census of 1900, Vol. II, pp. 17–18.) Equal suffrage would largely increase the proportion of native-born voters.

The foreign vote is objectionable only so far as it is an ignorant vote. Intelligent foreigners, both men and women, are often very valuable citizens. On the other hand, the ignorant foreign immigrants who come here are fully imbued, both men and women, with all the Old World ideas as to the inferiority and subjection of women. It is not until they have become pretty thoroughly Americanized that they can tolerate the idea of women's voting. The husbands are not willing that their wives should vote, and the wives ridicule the suggestion.

Experience shows that until they have become Americanized the foreign women will not vote. And after they have become Americanized, why should they not vote as well as anyone else?

THE CRIMINAL VOTE.

To the vote of every criminal man you would add the vote of a criminal woman.

The vicious and criminal class is comparatively small among women. According to the latest tabulated prison statistics of the United States census—those for 1904—Alabama had in her State prison and State and county penitentiaries 1,796 men and 94 women; Arizona, 293 men and 1 woman; Arkansas, 769 men, 23 women; California, 2,359 men, 24 women; Colorado, 848 men, 16 women; Connecticut, 460 men, 14 women; Delaware, 155 men, 5 women; District of Columbia, 41 men, 5 women; Florida, 1,075 men, 30 women; Georgia, 2,243 men, 82 women; Idaho, 139 men, 3 women; Illinois, 2,383 men, 36 women; Indiana, 792 men, no women; Iowa, 832 men, 28 women; Kansas, 2,279 men, 31 women; Kentucy, 1,872 men, 71 women; Louisiana, 1,296 men, 35 women; Maine, 178 men, 5 women; Maryland, 1,389 men, 113 women; Massachusetts, 1,824 men, 39 women; Michigan, 948 men, 1 woman; Minnesota, 620 men, 12 women; Mississippi, 1,021 men, 28 women; Missouri, 2,091 men, 72 women; Montana, 436 men, 8 women; Nebraska, 322 men, 5 women; Nevada, 91 men, no women; New Hampshire, 157 men, 3 women; New Jersey, 1,402 men, 69 women; New Mexico, 240 men, 7 women; New York, 5,392 men, 313 women; North Carolina, 631 men, 43 women; North Dakota, 149 men, 2 women; Ohio, 1,587 men, 41 women; Oklahoma, 22 men, no women; Oregon, 332 men, 2 women; Pennsylvania, 1,966 men, 35 women; Rhode Island, 388 men, 63 women; South Carolina, 632 men, 28 women; South Dakota, 193 men, 3 women; Tennessee, 1,575 men, 62 women; Texas, 4,073 men, 117 women; Utah, 171 men, 2 women; Vermont, 259 men, 15 women; Virginia, 1,478 men, 68 women; Washington, 791 men, 4 women; West Virginia, 982 men, 32 women; Wisconsin, 608 men, 12 women; Wyoming, 189 men, 3 women.

In the prisons of the United States as a whole, including those for all kinds of offenses, women constitute only 5½ per cent of the prisoners, and the proportion is growing smaller.

Equal suffrage would increase the moral and law-abiding vote very largely, while increasing the vicious and criminal vote very little. This is a matter not of conjecture but of statistics.

THE BAD WOMEN'S VOTE.

The bad women would outvote the good ones.

In America the bad women are so few, compared with the good ones, that their votes could have little influence. Mrs. Helen Gilbert Ecob, wife of a prominent clergyman who was for some years a pastor in Denver, writes:

"The bad women represent, in any city of the United States, but an infinitesimal proportion of its population, and the vote of that class in Denver is confined practically to 3 precincts out of 120."

Mrs. Sarah Platt Decker, of Denver, ex-president of the General Federation of Women's Clubs, and also for some years president of the Colorado State Board of Charities and Correction, writes:

"Does not the vote of the disreputable class of women overbalance the better element? No; the women of the half-world are not willing to vote. They are constantly changing their residences and their names. They do not wish to give any data concerning themselves, their age, name, or number and street; they prefer to remain unidentified."

Ex-Gov. Warren, of Wyoming, sums it all up when he says, in a letter to Horace G. Wadlin, of Massachusetts:

"Our women nearly all vote; and since, in Wyoming as elsewhere, the majority of women are good and not bad, the result is good and not evil."

DON'T UNDERSTAND BUSINESS.

A municipality is a great business corporation. Men, by the nature of their occupations, know more about business than women, and hence are better fitted to run a city or a State.

Women have a vote in every other corporation in which they are shareholders. George William Curtis said: "A woman may vote as a stockholder upon a railroad from one end of the country to the other; but, if she sells her stock and buys a house with the money, she has no voice in the laying out of the road before her door, which her house is taxed to keep and pay for."

Moreover, it is not true that a man's experience in his own business teaches him how to carry on the business of a city. Some years ago a fashionable caterer was elected to the Massachusetts Legislature, and was appointed a member of the committee on filling up the South Boston flats. Another member said to him scornfully, "What do you know about filling up flats, anyway?" The caterer answered quietly, "That has been my business for 20 years." The answer was good, as a joke; but as a matter of fact, what had his experience of planning dinners taught him about the way to turn tide mud into solid ground? What does the butcher learn from his business about the best way to pave a street, or the baker about the best way to build a sewer, or the candlestick maker about the best way to lay out a park, or to choose schoolteachers or policemen, or to run a city hospital? Does a minister learn from his profession how to keep the streets clean, or a lawyer how to conduct a public school, or a doctor how to put out a fire? A man's business, at best, gives him special knowledge only in regard to one or two departments of city affairs. Women's business, as mothers and housekeepers, also gives them special knowledge in regard to some important departments of public work, those relating to children, schools, playgrounds, the protection of the weak and young, morals, the care of the poor, etc. For what lies outside the scope of their own experience men and women alike must rely upon experts. All they need as voters is sense enough and conscience enough to elect honest and capable persons to have charge of these things.

DIVISION OF LABOR.

The growth of civilization is marked by an increasing specialization and division of labor. Woman suffrage would therefore be a step backward.

The growth of civilization increases the division of labor as between individuals, but lessens it as between the sexes. One woman no longer spins and weaves and manufactures the clothing for the men of her family, at the same time carrying on all the housework and, in addition, making butter, cheese, and candles, as our great-grandmothers did. This work is now subdivided among a number of specialists. On the other hand, in the old times women were excluded from almost all the occupations of men. Housework and sewing were practically the only ways open to them to earn a living. To-day, out of more than 300 trades and professions followed by men, women are found in all but 3 or 4.

But this objection about the subdivision of labor is really irrelevant. Voting is not labor, in the sense of a trade or profession. The tendency of civilization has been to a greater and greater specialization of labor, but not to a closer and closer restriction of the suffrage. On the contrary, that has been steadily extended. The best results are found not where public affairs are left in the hands of a small class of "professional politicians," but where the largest proportion of the people take a keen interest and an active part in their own government.

WOULD LOSE THEIR INFLUENCE.

Women would lose their influence.

What gives a woman influence? Beauty, goodness, tact, talent, pleasant manners, money, social position, etc. A woman who has any of these means of influence now would still have them if she had a vote, and she would have this other potent means of influence besides. There is a story of a prisoner who had been shut up for many years in a dungeon, getting sunlight only through a chink in the wall. He grew much attached to that chink. At last his friends came and offered to tear down the wall. His mind had become weakened, and he begged them not to do it. If they destroyed the wall, he said, they would also destroy the chink through which he got all his sunlight, and he would be left in total darkness. If he had had his wits, he would have seen that he would have all the sunlight he had before and a great deal more besides. A woman after enfranchisement would have all the personal influence she has now and political influence in addition. One thing is certain: Every vicious interest in this country, to which women are hostile, would rather continue to contend with women's "indirect influence" than try to cope with women's vote.

CEASE TO BE RESPECTED.

Women would cease to be respected.

Mrs. Sarah Platt Decker, of Denver, writes: "Under equal suffrage there is a much more chivalrous devotion and respect on the part of men, who look upon their sisters not as playthings or as property, but as equals and fellow citizens."

Mrs. K. A. Sheppard, president of the New Zealand Council of Women, says: "To-day a young New Zealander in his teens no longer regards his mother as belonging to a sex that must be kept within a prescribed sphere, but as a human being, clothed with the dignity of all those rights and powers which he hopes to enjoy within a few years."

Mrs. A. Watson Lister, secretary of the Woman's National Council of Australia, says: "One striking result of equal suffrage is that members of Parliament now consult us as to their bills, when these bear upon the interests of women. The author of the new divorce bill asked all the women's organizations to come together and hear him read it, and to make criticisms and suggestions. I do not remember any such thing happening before in all my years in Australia. When a naturalization bill was pending, one clause of which deprived Australian women of citizenship if they married aliens, a few women went privately to the prime minister and protested, and that clause was altered immediately. After we had worked for years with members of Parliament for various reforms without avail, because we had no votes, you can not imagine the difference it makes." (Woman's Journal, Feb. 13, 1904.)

WOULD MAKE WOMEN PARTISANS.

Women can do more good now than if they had a vote, because now they are nonpartisan. If they became voters, their nonpartisan influence would be lost.

Women continue to be nonpartisan after they have the ballot, and it gives them more power to secure the good things which the women of all parties want.

Prof. Henry E. Kelly, formerly of the Iowa State University, now practicing law in Denver, says in an open letter to State Senator A. H. Gale, of Iowa, that he went to Colorado opposed to equal suffrage, but has been converted by what he has seen of it. Prof. Kelly adds:

"Experience clearly shows that women's interest can not be aroused in mere partisan strife. Their interests center around questions affecting education, public cleanliness, public morality, civic beauty, charities and correction, public health, public libraries, and such subjects as more intimately affect home life and conduce to the prosperity of the family. Men lose sight of these important considerations in the scramble of partisan warfare for office, but women will not see them obscured by anything."

Ellis Meredith, of Denver, writes:

"There has never been a party measure espoused by women in the Colorado Legislature. The women of all parties want the same things, and have worked for them together in perfect harmony. They wanted a pure-food law, and secured one from the last legislature in line with the national legislation. They wanted civil-service reform, and have obtained that so far as the officers of State institutions are concerned. During the last legislature an attempt was made to take the control of the State bureau of child and animal protection away from the Colorado Humane Society and to create a political board. Every federated woman's club in the State besieged its senators and representatives to vote against the bill, and the vice chairmen of the State central committees of the two chief political parties (both of them women) went together to different members of the legislature to enter their protest. Men understand that in legislative matters when they oppose the women they are opposing practically all the women, and the great independent vote of the State." (Woman's Journal, Aug. 31, 1907.)

OPPOSITION OF WOMEN.

Women in large numbers are organizing against suffrage. The majority are opposed to it, and the majority ought to rule.

Mrs. Julia Ward Howe says:

"The organized opposition among women to suffrage is very small compared with the organized movement of women in its favor. Out of our 46 States only 4 have antisuffrage associations. Tiny antisuffrage committees exist in 4 States more. There are suffrage associations in 33 States and several Territories.

"In New York, at the time of the last constitutional convention, the suffragists secured more than 300,000 signatures to their petitions; the antisuffragists only 15,000. The woman-suffrage petitions presented to the recent constitutional convention in Michigan bore 175,000 signatures. There were no petitions on the other side. In Chicago, not long ago, 97 organizations, with an aggregate membership of more than 10,000 women, petitioned for a woman-suffrage clause in the new city charter, while only one small organization of women petitioned against it. In Maine, Iowa, Kansas—in short, in every State where petitions for suffrage and remonstrances against it have been sent to the legislature—the petitioners have always outnumbered the remonstrants, and have generally outnumbered them 50 or 100 to 1. On the only occasion when the Government took an official referendum among women on the sub-

ject (in Massachusetts in 1895) the women's vote was in favor of suffrage 25 to 1.

"Most women are as yet indifferent on the suffrage question; but of those who take any lively interest in it either way the great majority are in favor. This has been demonstrated wherever the matter has been brought to a test." (Woman's Journal, Aug. 1, 1908.)

ALREADY OVERBURDENED.

Women are already overburdened. A woman would not have time to perform her political duties without neglecting higher duties.

Mrs. Alice Freeman Palmer says (Objections to woman suffrage answered by college women):

"How much time must she spend on her political duties? If she belongs to the well-to-do class and hires others to do her work, she has time for whatever interests her most—only let these interests be noble! If she does her own housework, she can take 10 minutes to stop on her way to market and vote once or twice a year. She can find half an hour a day for the newspapers and other means of information. She can talk with family and friends about what she reads. She does this now; she will then do it more intelligently and will give and receive more for what she says and hears. If she does this reading and talking, she will be better informed than the majority of voters are now.

"The duties of motherhood and the making of a home are the most sacred work of women, and the dearest to them, of every class. If casting an intelligent vote would interfere with what only women can do—and what, failed in, undermines society and government—no one can question which a woman must choose. But it can not be shown that there are any large number of women in this country who have not the necessary time to vote intelligently, and it can be argued that study of the vital questions of our Government would make them better comrades to their husbands and friends, better guides to their sons, and more interesting and valuable members of society. Women of every class have more leisure than men—are less tied to hours of routine—they have had more years of school training than men. All this makes simple the combination of public and higher duties."

WOMEN AND OFFICE HOLDING.

If women vote, they must hold office.

When we say that women would be eligible to hold office, what do we mean? Simply that if a majority of the people in any place would rather have a woman to hold a certain position than anyone else, and if she is willing to serve, they shall be allowed to elect her. Women are serving as officials already; some of the women most prominent in opposing equal suffrage have been holders of public office. The late president of the Massachusetts Association Opposed to the Further Extension of Suffrage to Women (Mrs. J. Elliot Cabot) was for years a member of the school board of Brookline and also overseer of the poor. Yet that association in its published documents objects to equal suffrage on the ground that "suffrage involves the holding of office, and office holding is incompatible with the duties of most women." Suffrage does not involve office holding by the majority of women, but only by a few; and there are always some women of character and ability who could give the necessary time. Women as a class have more leisure than men.

In the enfranchised States there has been no rush of women into office, and the offices that women do hold are mainly educational and charitable. In Wyoming women have had full suffrage for 39 years, yet no woman has ever been a member of the legislature. Neither Colorado, Utah, nor Idaho has ever had more than three women in the legislature at one time.

BALLOTS AND BULLETS.

If women vote, they ought to fight and do police duty.

If no men were allowed to vote except those who are able and willing to do military and police duty, women might consistently be debarred for that reason. But so long as the old, the infirm, the halt, the lame, and the blind are freely admitted to the ballot box, some better reason must be found for excluding women than the fact that they do not fight. All men over 45 are exempt from military service, yet they vote. Col. T. W. Higginson says: "It appears by the record of United States military statistics that out of the men examined for military duty during the Civil War of journalists 740 in every 1,000 were found unfit; of preachers, 974; of physicians, 680; of lawyers, 544. (Medical statistics of the provost general's bureau quoted by Col. T. W. Higginson in Common Sense about Women, p. 365.) Grave divines are horrified at the thought of admitting women to vote when they can not fight, though not 1 in 20 of their own number is fit for military duty if he volunteered. Of the editors who denounce woman suffrage only about 1 in 4 could himself carry a musket, while of the lawyers who fill Congress the majority could not be defenders of their country but could only be defended."

Again, it must be remembered that some woman risks her life whenever a soldier is born into the world. Mrs. Z. G. Wallace, of Indiana, from whom Gen. Lew Wallace drew the portrait of the mother in Ben Hur, said: "If women do not fight, they give to the State all its soldiers." This ought in all fairness to be taken as an offset for the military service that women do not render. As Lady Henry Somerset says, "She who bears soldiers does not need to bear arms."

CAN LAWS BE ENFORCED?

Laws could not be enforced unless the majority of legal voters represented the majority of possible fighters.

But thousands of male noncombatants are already admitted to the ballot box, and there is no certainty at any election that the majority of voters represents a majority of possible fighters. No trouble of this kind has resulted from equal suffrage in practice. The laws are as well enforced in the enfranchised States as in adjoining States where women have no vote.

Where women have school suffrage their votes occasionally turn the scale, but there is never any attempt to install the defeated candidates by force. Where women have the full ballot they have often defeated bad candidates for higher offices, but no riotous uprising has ever followed. This particular objection is a libel on American manhood.

WILL IT INCREASE DIVORCE?

It will lead to family quarrels and increase divorce.

Full suffrage was granted to the women of Wyoming in 1869. During the 20 years from 1870 to 1890 divorce in the United States at large increased about three times as fast as the population. In the group of Western States, omitting Wyoming, it increased nearly four times as fast as the population. In Wyoming it increased only about half as fast as the population. "An ounce of experiment is worth a ton of theory."

A father sometimes turns his son out of doors for voting the wrong ticket, but among American men this is rare. Where such a case does arise, it is to be met by educating the domestic despot, not by disfranchising all the members of the family but one. A couple who are sensible and good-tempered will not quarrel if they are once in a while unable to think alike about politics. A couple who are not sensible and good-tempered are sure to quarrel anyway—if not about politics, then about something else.

THE QUESTION OF CHIVALRY.

It will destroy chivalry.

Justice would be worth more to women than chivalry if they could not have both. A working girl put the case in a nutshell when she said: "I would gladly stand for 20 minutes in the street car going home if by doing so I could get the same pay that a man would have had for doing my day's work." But women do not have to stand in the street cars half as often in Denver as in Boston or New York. Justice and chivalry are not in the least incompatible. Women have more freedom and equality in America than in Europe, yet American men are the most chivalrous in the world.

KNOWN BY ITS ENEMIES.

It would increase the corruption of politics.

Those who thrive upon the corruption of politics do not think so. The ignorant, vicious, and criminal vote is always cast solidly against equal rights for women.

TOO EMOTIONAL.

Women are too emotional and sentimental to be trusted with the ballot.

Mrs. E. T. Brown, at a meeting of the Georgia State Federation of Women's Clubs, read a paper in which she said:

"You tell us that women are not fitted for dealing with the problems of government, being too visionary and too much controlled by sentiment.

"Now it is very true of women that they are largely controlled by sentiment, and, as a matter of fact, men are largely controlled by sentiment also, in spite of their protesting blushes. Was it logic that swept like a wave over this country and sent our Army to protect the Cubans when their suffering grew too intense to be endured even in the hearing? Is it shrewd business calculation that sends thousands of dollars out of this country to feed a starving people during the ever-recurring famines in unhappy India? Was it hard common sense that sent thousands of American soldiers into what looked like the death trap of China in the almost baseless hope of rescuing a few hundred American citizens? Do not men like Washington, Lincoln, Jefferson, and Lee live in the hearts of American men, not alone for what they did but still more for what they dreamed of? The man who is not controlled by sentiment betrays his friends, sells his vote, is a traitor to his country, or wrecks himself, body and soul, with immoralities; for nothing but sentiment prevents any of these things. The sense of honor is purely sentiment. The sentiment of loyalty is the only thing that makes truth and honesty desirable or a vote a nonsalable commodity.

"Government would be a poor affair without sentiment, and it is not likely to be damaged by a slightly increased supply."

WHAT IS THE UNIT?

The political unit is the family.

The childless widower, the unmarried boy of 21, and the confirmed old bachelor of 90 have votes; the widow with minor children has none. Under our laws the political unit is not the family, but the male individual. The unequal number of grown persons in different families would make it impossible to treat the family as the political unit.

WOMEN'S SMALL SCHOOL VOTE.

The smallness of women's school vote shows that they would not use the full ballot.

The size of men's vote is just in proportion to the size of the election. At presidential election it is very large, at State elections much smaller, at a municipal election smaller still, and at school elections, wherever these are held separately, only a fraction of the men turn out to vote. The smallness of the woman's school vote is regrettable, but it is only a new proof of the truth of Mrs. Poyser's immortal saying: "I am not denying that women are foolish; God Almighty made them to match the men!"

In Kansas women were given school suffrage in 1861. Their vote was small. In 1887 they were given full municipal suffrage. Their vote at once became much larger and has increased at successive elections.

In Colorado women were given school suffrage in 1876. Their vote was small. In 1893 they were given the full ballot, and on January 31, 1899, the Colorado Legislature declared by a practically unanimous vote of both houses that "during this time (the preceding five years) women have exercised the privilege as generally as men."

The women's school vote has completely disproved the fear that the bad women would be the first to rush to the polls. In answer to the prediction that the best women will not vote, Col. Higginson says (The Nonsense of It): "In Massachusetts, under school suffrage, the complaint has been that only the best women vote."

WILL WOMEN VOTE?

Women will not vote, or will cease to vote after the novelty has worn off.

In Wyoming women have had full suffrage since 1869. The Wyoming secretary of state, in a letter to Miss Alice Stone Blackwell, of Boston, says that 90 per cent of them vote. (Woman's Journal, May 6, 1905.)

The Colorado secretary of state, in a letter to Mrs. Charles Park, of Boston, says that 80 per cent of Colorado women register and about 72 per cent vote. (Woman's Journal, Aug. 20, 1908.)

The chief justice of Idaho and all the justices of the State supreme court have signed a published statement that "the large vote cast by the women establishes the fact that they take a lively interest." (Woman's Journal, Aug. 20, 1908.)

In Australia, at the last Federal election, 628,235 men voted and 431,033 women. (Progress, December, 1907.)

When woman suffrage was granted in New Zealand, in 1893, the estimated number of women in the country was 139,915. Of these, 109,461 registered to vote, and the number of women voting has increased at each triennial parliamentary election since. In 1893, 90,290 women voted; in 1896, 108,783; in 1899, 119,550; in 1902, 138,565; in 1905, 175,046. (Mrs. K. A. Sheppard, president New Zealand Council of Women, in "Woman Suffrage in New Zealand.")

The majority of the women had never asked for suffrage in any of these places.

A GROWING CAUSE.

Opposition to woman suffrage is growing. In Oregon a larger proportional vote was cast against the suffrage amendment in 1908 than in 1906 or 1900.

There are now five States in which woman suffrage has been submitted to the voters more than once, at intervals of some years. In

four of the five the latest vote was the most favorable to woman suffrage; in one it was the other way.

In Colorado, when woman suffrage was submitted the first time, it was defeated; the second time, it was carried.

In Kansas, the first time, it received only 9,100 votes; the second time, it received 95,302.

In the State of Washington, the first time the majority against it was 19,386; the second time, it was only 9,882.

In South Dakota, the first time the adverse majority was 23,610; the second time, it dropped to 3,285.

Since on their latest vote four States show a gain for woman suffrage, while only one shows a retrogression, it is clear that growth of the cause is the rule, and that the result in Oregon was due to exceptional local circumstances. Which ought to carry the more weight, four States or one?

THE OREGON VOTE.

The increased adverse vote in Oregon was due to the Antisuffrage Association formed by Oregon women, and to the bad results of equal suffrage in the neighboring States of Idaho and Colorado.

Oregon is the only State where a woman suffrage amendment has been submitted more than twice. There it has been submitted four times. Its first submission was in 1884, before any antisuffrage association had been formed, and before either Idaho or Colorado had granted the ballot to women. At that time it received a smaller proportional vote than it has ever received since. In 1884 it was defeated by a vote of 28,176 to 11,223—almost 3 to 1. In 1908 the vote against it was 58,670 to 36,858—much less than 2 to 1.

THE TEST OF EXPERIMENT.

It works badly in practice.

Women now have the full ballot in Colorado, Wyoming, Utah, Idaho, New Zealand, Australia, Finland, and Norway. They have municipal suffrage throughout England, Scotland, Ireland, many of the English colonies, Sweden, and Denmark. In some of these countries they have had it for generations.

In all these places put together the opponents thus far have not found a dozen respectable men who assert over their own names and addresses that it has had any bad results.

This is the more remarkable in view of the fact that active antisuffrage associations in New York and Massachusetts have been for years diligently gathering all the adverse testimony they could find.

On the other hand, scores of the most highly esteemed men and women in the equal suffrage States testify that the results are good.

In Wyoming women have had the full ballot for 39 years. For the last 20 years the advocates of equal suffrage have had a standing challenge inviting its opponents to find in all Wyoming two respectable men who will assert over their own names and addresses that it has had any bad results whatever. The opponents have thus far failed to respond.

DOUBLING THE VOTE.

It would only double the vote without changing the result.

If letting women sing in church merely doubled the volume of sound, it would still be a good thing, because it would double the number of persons who had the lung exercise and the inspiration of joining in a good hymn and it would make the chorus stronger. If equal suffrage merely doubled the number of voters, it would still do good, because to take an interest in public affairs would give women mental stimulus and greater breadth of view, and it would also bring to bear on public problems the minds of an increased number of intelligent and patriotic citizens. But the great advantage of women in music is that they add the soprano and alto to the tenor and bass. If women were exactly like men, equal suffrage would merely double the vote. But women are different from men, and women's voices in the State, like women's voices in the choir, would be the introduction of a new element. This is recognized even by opponents when they express the fear that equal suffrage would lead to "sentimental legislation."

Men are superior to women along certain lines and women are superior to men along certain others. The points of weakness in American politics at present are precisely the points where women are strong. There is no lack in our politics of business ability, executive talent, or "smartness" of any kind. There is a dangerous lack of conscience and humanity. The business interests, which appeal more especially to men, are well and shrewdly looked after; the moral and humanitarian interests, which appeal more especially to women, are apt to be neglected.

NOT A NATURAL RIGHT.

Suffrage is not a natural right.

It is hard to define just what a "natural right" is. Dr. James Freeman Clarke said: "If all women were forbidden to use the sidewalk, and they complained of the injustice, it would be no answer to tell them that it was not a natural or inherent right but one given by society and which society might, therefore, control as it saw fit. A great many rights are given by society, of which, however, it would be manifestly unjust to deprive either sex."

TOO MANY VOTERS.

We have too many voters already.

This only means that we have too many voters of the wrong kind. If to increase the number of voters were an evil in itself, every woman who becomes the mother of half a dozen sons would have done harm to her country. But if all six grow up to be good voters, she has conferred a benefit on her country. So she has if five of them become good voters and only one a bad voter. Woman suffrage would bring in at least five good voters to one bad one.

It is often said that we have too many immigrants. We mean too many immigrants of an undesirable kind. We all rejoice when we hear of a large influx from Finland or some other country whose people are considered especially desirable immigrants. We want them to offset those of less virtuous and law-abiding races. The governor of one of the enfranchised States writes of woman suffrage: "The effect of this increase in the vote is the same as if a large and eminently respectable class of citizens had immigrated here."

WOULD UNSEX WOMEN.

It will turn women into men.

The differences between men and women are natural; they are not the result of disfranchisement. The fact that all men have equal rights before the law does not wipe out natural differences of character and temperament between man and man. Why should it wipe out the natural differences between men and women? The women of England, Scotland, Ireland, Australia, New Zealand, and our own equal-suffrage States are not perceptibly different in looks or manners from women elsewhere, although they have been voting for years.

WOMEN DO NOT WANT IT.

Whenever the majority of women ask for suffrage, they will get it.

Every improvement in the condition of women thus far has been secured not by a general demand from the majority of women, but by the arguments, entreaties, and "continual coming" of a persistent few. In each case the advocates of progress have had to contend not merely with the conservatism of men, but with the indifference of women, and often with active opposition from some of them.

When a man in Saco, Me., first employed a saleswoman, the men boycotted his store and the women remonstrated with him on the sin of placing a young woman in a position of such "publicity." When Lucy Stone began to try to secure for married women the right to their own property, women asked with scorn, "Do you think I would give myself where I would not give my property?" When Elizabeth Blackwell began to study medicine, the women at her boarding house refused to speak to her, and women passing her on the street held their skirts aside. It is a matter of history with what ridicule and opposition Mary Lyon's first efforts for the education of women were received, not only by the mass of men, but by the mass of women as well.

In the eastern countries where women are shut up in zenanas and forbidden to walk the streets unveiled, the women themselves are often the strongest upholders of these traditional restrictions, which they have been taught to think add to their dignity. The Chinese lady is as proud of her small feet as any American antisuffragist is of her political disabilities. Pundita Ramabai tells us that the idea of education for girls is so unpopular with the majority of Hindoo women that when a progressive Hindoo proposes to educate his little daughter, it is not uncommon for the women of his family to threaten to drown themselves.

All this merely shows that human nature is conservative, and that it is fully as conservative in women as in men. The persons who take a strong interest in any reform are generally few, whether among men or women, and they are habitually regarded with disfavor, even by those whom the proposed reform is to benefit.

Many changes for the better have been made during the last half century in the laws, written and unwritten, relating to women. Everybody approves of these changes now, because they have become accomplished facts. But not one of them would have been made to this day if it had been necessary to wait till the majority of women asked for it. The change now under discussion is to be judged on its merits. In the light of history, the indifference of most women and the opposition of a few must be taken as a matter of course. It has no more rational significance now than it has had in regard to each previous step of women's progress.

On Congressional Services of Hon. Henry M. Goldfogle.

EXTENSION OF REMARKS

OF

HON. FRANK CLARK,

OF FLORIDA,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, February 24, 1915.

Mr. CLARK of Florida. Mr. Speaker, I desire to place on the record of this House a few of the very many expressions of well-deserved praise and appreciation my esteemed associate, the Hon. HENRY M. GOLDFOGLE, of New York, received from many sections of this country on his labors in opposition to the literacy test in the immigration bill. Judge GOLDFOGLE has passed through 14 years of active, honorable, and creditable service in Congress. During these years he has been a hard working and efficient member of important committees, among them the Committee on Interstate and Foreign Commerce, the Insular Affairs Committee, the Committee on Immigration and Naturalization, and the great Committee on Rules, on which latter three committees he is now a member, besides being also the chairman of the Elections Committee. The New York State Democratic delegation in the House selected him to represent that State on the national Democratic congressional committee, of which he was made one of its vice chairmen. It is pleasing to me to be able to say that Judge GOLDFOGLE is an influential Member of this body, possessing the confidence and respect of the general membership of the House.

Judge GOLDFOGLE's efforts were such that he well merited the encomiums sent to him by leading and distinguished American citizens of various nationalities and creeds and many societies and organizations of high standing throughout the country. Typical of these are two letters I desire to print in the RECORD, one from the American Jewish Committee, represented by Louis Marshall, its president. That committee is composed of some of the best known and distinguished men in the United States. The other letter comes from a society with a membership of 50,000 people spread through the United States, whose headquarters are located in the district which for 14 long years was with ability and fidelity represented by Judge GOLDFOGLE. In concluding these remarks I want to heartily join in the regrets I have heard frequently expressed by many of our associates that in Judge GOLDFOGLE's retirement from the House, which retirement we hope is but temporary, the House loses a useful and valuable Member, whose broad experience and painstaking efforts and diligent service as a Member of Congress reflected

credit on the people of his congressional district he so faithfully served.

I would not permit the occasion to pass without making reference to the great work done by Judge GOLDFOGLE which led up to and, I may say, resulted in the abrogation of the Russian treaty. For years his labors to bring about the uniform recognition of our passports held by American citizens regardless of race or creed were conducted with tireless energy and with statesmanlike dignity. Successful in the passage of his resolution at every step, his people may well look with pride at the splendid record he made and in the results he achieved in his battle to secure the vindication of the rights of American citizenship.

Mr. Speaker, I append to these remarks the letters to which I referred. They are as follows:

No. 37 Wall Street, New York, January 19, 1915.

Hon. HENRY M. GOLDFOGLE.

DEAR JUDGE: I wish to extend to you, on behalf of the American Jewish committee and personally, the expression of sincere appreciation for your very thorough and excellent work in bringing about the defeat of the immigration bill, with its infamous literacy test, and sustaining the admirable veto message of President Wilson. Your complete familiarity with the subject and your great experience were of inestimable advantage to the cause of the honest immigrant who seeks asylum in this blessed land of liberty and who comes hither for the purpose of becoming an industrious and useful adjunct in the building and developing of our resources. You have earned the gratitude of all right-thinking men.

Very truly, yours, LOUIS MARSHALL.

HEBREW SHELTERING AND IMMIGRANT AID SOCIETY OF AMERICA,
229–231 East Broadway, New York, February 15, 1915.

Hon. HENRY M. GOLDFOGLE,
Member of Congress, Washington, D. C.

DEAR SIR: At the regular meeting of the board of directors of the Hebrew Sheltering and Immigrant Aid Society of America, which has about 50,000 active members all over the United States, I was instructed to extend to you our hearty congratulations and sincere thanks for your splendid attitude on the Burnett bill.

By refusing to let this un-American measure become law you have earned the gratitude of all lovers of American traditions.

Cordially, yours,

LEON SANDERS, *President.*

Railway Mileage of the World Under Private and Public Ownership.

EXTENSION OF REMARKS
OF
HON. JAMES W. BRYAN,
OF WASHINGTON.

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, February 23, 1915.

Mr. BRYAN. Mr. Speaker, the most satisfactory statement I have been able to find of the railway mileage of the earth in private ownership and in State ownership or control is in an English "return" published by the English Government, which separates in its statement the railways in the British possessions and those in foreign countries. For my present purpose the "return" is somewhat awkward, in that it approaches the subject from a British standpoint, but the figures are so clear and concisely set forth that we can well afford to overlook the unusual importance paid in the "return" to British railroads as compared with foreign railroads. The following introduction to the pamphlet will suffice for necessary information. Those who may want to study the subject further are referred to the document, which may be found in the Congressional Library, and no doubt in other libraries throughout the country:

"STATE RAILWAYS IN BRITISH POSSESSIONS AND FOREIGN COUNTRIES.

"The following return contains reports on certain matters connected with the State ownership and working of railways, or other participation in railway enterprise, in all the British self-governing dominions, in India, in 17 British colonies not possessing responsible government and protectorates, and in 42 foreign countries. The reports are based on information furnished by the Governments of the self-governing dominions, colonies, and protectorates by the India office and by His Majesty's diplomatic representatives in foreign countries, and contain the latest information available, though in the case of some foreign countries this is not of a very recent date.

"BRITISH SELF-GOVERNING DOMINIONS.

"In Australia, New Zealand, and South Africa the policy of State ownership and operation of railways has been adopted, with the result that private railways play a part which is relatively extremely small. In Canada, on the other hand, although the Dominion Government has owned and operated railways since confederation, State railways have hitherto formed a comparatively insignificant portion of the railway system of the Dominion. In Newfoundland by far the greater portion of the railways are State owned, but leased to a private company. The following table sets out the main facts as to railway ownership in the Dominions:

Dominions.	Date to which details relate.	Length of railways (miles).		
		State owned and operated.	State owned and privately operated.	Privately owned and operated.
Canada	June 30, 1911	2,018	102	26,278
Newfoundland	Dec. 31, 1911	.....	723	47
Australia	June 30, 1911	16,079	.....	1,934
New Zealand	Mar. 31, 1912	2,808	.....	29
South Africa	Dec. 31, 1911	7,548	.....	545
Total	.....	28,453	825	28,833

"INDIA.

"According to the administration report of the Indian Railway Board for 1911 there were at the end of that year 32,893 miles of railway open in India. Of these it appears from the tables included in the present return that 6,874 miles were owned and operated by the Government of India; 18,245 miles were owned by the Government of India but operated by companies; 1,662 miles were owned and operated by native States; 1,648 miles were owned by native States but operated by private companies (including 256 miles worked by the State Railway Administration); and 170 miles were owned by district boards or the administration of the French settlements in India. These figures account for a total of 28,599 miles (including some slight duplication); of the remaining railways of India some are subsidized (by guaranty of interest or otherwise) by the Indian Government or local governments or district boards.

"BRITISH COLONIES NOT POSSESSING RESPONSIBLE GOVERNMENT AND PROTECTORATES.

"The reports contained in the present return show that in 17 British Colonies not possessing responsible government and protectorates, there were in the year 1911–12 State railways amounting in all to 3,525 miles. The only Colonies and protectorates, and so forth, possessing railway systems in which there were no Government-owned lines are Barbados, British Guiana, Nyasaland, the Bechuanaland Protectorate, the settlement of Lobuan, and Rhodesia. In the last-named territory the railways are, however, mainly owned by a company which is a subsidiary of the British South Africa Co. In the British Colonies and protectorates as a whole the total length of privately owned railways was 2,596 miles, of which 2,351 miles belonged to the Rhodesian railway system operating in Rhodesia, the Bechuanaland Protectorate, and Portuguese East Africa.

"FOREIGN COUNTRIES.

"Of the countries not covered by the series of reports comprised in the present return, the only one of importance is the United States of America, where the whole of the 249,902 miles of railway in operation on the 31st of December, 1910, were privately owned and operated. In Abyssinia and Salvador there are small private lines, whilst Crete, Liberia, Persia, and San Domingo are not at present in possession of railway systems, either State or private.

"(*a*) Countries which have only State systems, or in which the private lines, though continuing to exist, are comparatively insignificant. This group includes Belgium, Bulgaria, Egypt, Germany, Italy, Japan, Nicaragua, Panama (Canal Zone), Roumania, Servia, and Siam.

"(*b*) Countries in which the State-owned lines are predominant in extent, but privately owned lines form an important part of the respective railway systems. This group includes Chile, China, Denmark, Honduras, the Netherlands, Peru, Russia (with Finland), and Switzerland.

"(*c*) Countries in which privately owned lines are predominant in extent, but the State-owned lines form an important part of the respective railway systems. This group includes the Argentine Republic, Austria-Hungary, Brazil, Costa Rica, France, Portugal, Sweden, and Turkey.

"(*d*) Countries in which the State-owned lines are comparatively insignificant. This group includes Cuba and Venezuela.

"(*e*) Countries in which the State has a predominant or large holding in railway enterprises, which are in form private companies. This class includes Mexico, Norway, and Colombia—in

the two former countries there are also railways which are in the sole ownership of the State.

"As regards working, the general rule is for the State itself to operate the lines which it owns, but in the Netherlands and Peru the whole of the State lines are operated on lease by private companies, and this is also the case with the larger part of the Brazilian Government lines. On the other hand, in Austria and Hungary a large extent of privately owned lines are operated by the State railway administration.

"In the remaining 10 countries included within the scope of the present return, viz, Bolivia, Ecuador, Greece, Guatemala, Haiti, Luxemburg, Montenegro, Paraguay, Spain, and Uruguay, there are at present no railways owned by the State—railways in Guatemala and Paraguay were constructed by the Governments, but subsequently transferred to private ownership—but State assistance has been rendered to railway enterprise by the grant of subsidies in various forms or by the guaranty of interest on capital, subject in some instances to conditions as to State participation in profits beyond a maximum amount or as to State rights or acquisition or the reversion of the railways to the State at the end of a prescribed period. These policies of State subventions or guaranty of interest, subject generally to conditions of the kind indicated, are in force also in a number of countries side by side with State ownership. The most conspicuous instance of this is furnished by France, but examples are to be found also in Brazil, Denmark, Mexico, Norway, Portugal, and Russia.

"In the following table an attempt has been made to classify, so far as possible, according to ownership and operation, the railways of the foreign countries covered by the present return, and such other foreign countries as have railway systems with regard to which information is available:

States.	Date to which details relate.	Length of railways (miles).				Remarks.
		State owned and operated.	Privately owned but State operated.	State owned but privately operated.	Privately owned and operated.	
Abyssinia	May —, 1912	.....	.....	.....	176	
Argentine Republic	Jan. 1, 1912	2,495	.....	.....	16,734	
Austria-Hungary:						
Austria	Dec. 31, 1911	8,074	3,593	.....	2,409	
Hungary	....do.....	5,063	5,771	.....	2,058	
Belgium	....do.....	2,530	151	.....	218	Exclusive of lines of "local interest."
Bolivia	Dec. 31, 1912	.....	.....	.....	616	
Brazil	Jan. 1, 1911	2,000	.....	4,405	3,020	In addition there were some 3,825 miles built by or under concessions from the governments of the various States of the Brazilian Union, but further details are not available.
Bulgaria	Dec. 31, 1910	1,195	.....	.....	.....	
Central American Republics:						
Costa Rica	June —, 1912	84	.....	.....	360

Venezuela	....do.....	.....	.....	68	470	

"The preceding table shows a total of 134,403 miles of railway operated—whether actually owned or not—by State railway administrations, and 367,675 miles operated by private enterprise, there being included in the latter figure a small proportion which is State owned. If to these totals there be added those previously given for the British self-governing dominions, the British colonies and protestorates, and India, the resultant figures are: Railways operated by governments, 174,917; railways operated by private enterprise, 424,232 miles. It is, however, necessary to point out that these totals relate solely

to the railways included in the above table and do not afford a precise indication of the relative extent of the railways operated by government and private enterprise, respectively, outside the United Kingdom, since the statistics for the various countries are not strictly comparable, owing especially to the inclusion in some instances and the exclusion in others of the mileage of 'secondary' or 'light' railways, and the fact that the railways in the colonial possessions of foreign countries are not included.

"BOARD OF TRADE, COMMERCIAL DEPARTMENT, *July, 1913.*"

I also extend the following statement to correct certain false statements being circulated throughout the country concerning the publicly owned utilities of the city of Seattle:

"SOME FACTS AND FIGURES FROM AN ADDRESS BY HON. GEORGE F. COTTERILL, FORMER MAYOR, AT THE SEATTLE COMMERCIAL CLUB, FEBRUARY 13, 1915—SEATTLE'S PUBLIC-OWNED UTILITIES—THEIR RECORD AND RELATION TO CITY TAXES AND REVENUES, THREATENED STATE LEGISLATION, CIVIC PROGRESS, AND PUBLIC WELFARE.

"An answer to the false and vicious attacks on the public resources, credit, past accomplishments, and future progress of the city and people of Seattle, such as have been brazenly made and staged with all the earmarks of a press-agency conspiracy. They have the plain and avowed purpose of influencing the State legislature to enact laws intended to cripple public enterprise and make it subservient to the greed of special-privilege corporations, whose agents and advocates are openly conducting a State and Nation wide campaign of slander against the good name and public interests of Seattle.

"If the banks of Seattle, any one or all of them, had been subjected to such false and malicious attacks upon their credit, resources, and business methods as the two Seattle newspapers, which for years have carried the Puget Sound Traction monopoly's business and political advertising, have directed against the city of Seattle during the past three months, they would have been wrecked and a business crisis precipitated. The falsity and impotence of these attacks upon municipal credit and resources are well evidenced by the active bidding for the recent municipal loan and its sale to a most conservative eastern banking concern on a 4 per cent interest basis.

"An attack upon the good name and credit of Seattle from outside the city would arouse the righteous indignation and united answer of every worth-while citizen. Are the would-be assassins of public credit from within to be immune from similar rebuke simply because their ulterior motives are well recognized and their public influence has been discounted to an admitted impotency? If the circulation of these slanders were limited to Seattle, they might well be ignored with contempt, but unfortunately they affect the outside opinion of Seattle, where the mendacity and misinformation can not be quickly recognized.

"Seattle is on a more solid financial basis, with greater resources and less debts, with more to show for her public expenditures, than any city in Washington. Her public-owned utilities are saving the taxpayers at least $2,000,000 per year, as compared with the rates paid for similar public service where private monopoly makes profit from public resources. This result has been accomplished without the increase of a dollar in taxation.

"Our municipal water system is unequaled anywhere; our city lighting system is the greatest rate reducer and public-service demonstration in America—not merely a success, but a business triumph. And the municipal railway is ready for a similar record, if given half a chance.

"Seattle needs no financial guardianship, at Olympia or elsewhere.

"GEO. F. COTTERILL."

Ten years of municipal ownership: A summary of the history of the Seattle city light and power system, Feb. 1, 1905, to Dec. 31, 1914 (compiled by former Mayor George F. Cotterill, consulting civil engineer, from the official records).

NOTE.—Figures for 1914 are from advance sheets of department reports and are subject to slight revisions in official report not yet issued.

SUMMARY STATEMENT.

On Dec. 31, 1914, a total of $6,22.,867 had been expended upon construction (including Cedar River Dam and Lake Union steam auxiliary). Against this $1,198,800 depreciation has been allowed and provided for from annual earnings, over and above the reconstruction and maintenance expenses included in annual operation costs. The plant was therefore worth $5,127,067 on Jan. 1, 1915. Against it stands a bonded debt (less sinking fund) of $3,570,600, with $421,000 of authorized but unissued bonds to cover expenditures which have been advanced. The total bonded debt will thereby be increased to $3,991,600, bearing an average of about 4¼ per cent interest, or a total interest charge of $170,000 per year. The plant value of $5,127,067 (after allowing $1,198,800 depreciation) is therefore $1,135,467 in excess of the bonded indebtedness when all authorized bonds are issued and sold; $359,857 of this excess was derived from assessments on local improvement districts for cluster-light system; the remaining $775,610 of present plant value being an investment of the surplus. The remainder of the surplus ($287,825) is represented in the inventories of stock, equipment, etc., not included in plant value and in the current funds and accounts. The investment in the Cedar River Dam ($1,695,743, including construction period interest and the railway to Cedar Lake), although carried from present surplus earnings without any return thus far, will provide reservoir capacity, which, when utilized, will more than double the available water-power reserve of the plant, and with added machinery and other facilities will make possible a continued increase of business up to twice its present volume.

Sources of earnings.

	1905	1906	1907	1908	1909	1910	1911

Power services[3]	391, at 7c-0.6c	448, at 4c-0.5c	678, at 4c-0.5c	819, at 4c-0.5c.
Rates reduced average 24 per cent below previous contract rates, or to the equivalent of		[4] 4.05	[4] 4½c	[4] 4½c

[1] Average rate collected, 5.983c. per kilowatt hour. [2] Average rate collected, 2.757c. per kilowatt hour. [3] Average rate collected, 1.54c. per kilowatt hour.
[4] All-inclusive rate.

"SEATTLE—THE BEST LIGHTED CITY IN AMERICA." SEATTLE HAS BECOME KNOWN AS THE BEST LIGHTED CITY IN AMERICA, YET IT GETS THE MOST LIGHT FOR THE LEAST COST.

Comparison of street-lighting costs, 1913.

	Total cost.	Mileage served, streets and alleys.	Cost per mile.	City area, square miles.	Cost per square mile.	Nature of service.
New York	$3,346,306	3,247	$1,030	327	$10,233	Contract.
Philadelphia	2,390,069	1,770	1,350	129	18,527	Do.
Boston	768,779	568	1,353	47	16,356	Do.
Chicago	1,473,027	4,525	325	194	7,593	Municipal.
Seattle	211,013	879	240	58	3,638	Do.

And the Seattle rate is reduced 11 per cent for 1915.

N. B.—Seventy-five thousand six hundred and seventy dollars, or 36 per cent of Seattle street-lighting cost, was paid in 1913 for furnishing electric current on 25 miles of cluster lighting on central streets. The other 854 miles of streets served cost only $135,343, or $158 per mile.

The above comparative figures for the other cities are from an address on "Municipal lighting rates," delivered at the Conference of American Mayors, at Philadelphia, November, 1914, by Ray Palmer, commissioner department of gas and electricity, of Chicago.

The Seattle city rate of 4½ cents per kilowatt hour (reduced to 4 cents for 1915) includes every item of cost incident to investment, interest, depreciation, operation, maintenance, replacements, supplies, and labor incident to the complete street-lighting service and its constant extensions in a growing city. This 4½-cent net rate produced in 1913 a proportionate street-lighting cost for Seattle of only one-fourth the ratio for New York, one-fifth that of Philadelphia and Boston, and only one-half that of Chicago, also with a municipal street-lighting plant.

And still Seattle is "the best lighted city in America."

The Late Representative Forrest Goodwin.

EXTENSION OF REMARKS

OF

HON. ROBERT P. HILL,

OF ILLINOIS,

IN THE HOUSE OF REPRESENTATIVES,

Sunday, February 21, 1915,

On House resolution 741, as follows:

"Resolved, That the business of the House be now suspended in order that opportunity may be given for tributes to the memory of Hon. FORREST GOODWIN, late a Member of this House from the State of Maine.

"Resolved, That as a particular mark of respect to the memory of the deceased and in recognition of his distinguished public career the House at the conclusion of these exercises stand adjourned.

"Resolved, That the Clerk communicate these resolutions to the Senate.

"Resolved, That the Clerk send a copy of these resolutions to the widow of the deceased."

Mr. HILL. Mr. Speaker, Hon. FORREST GOODWIN and I were both new Members of the present Congress. With our wives we both stopped at the Dewey Hotel, and there I got to know him and Mrs. Goodwin well in the few months he was here. Mr. GOODWIN displayed considerable interest in the discussion of the Underwood tariff bill, which was under consideration in the House during his service here.

I was appointed one of the committee to attend the funeral of Mr. GOODWIN at his home at Skowhegan. The concourse that assembled there was great. They came from every quarter, from every county in his district, from all over the State, to join in the last sad rites of their departed friend. Such universal grief I have never witnessed. It was a spontaneous outpouring of public sorrow, which proved how well these people had loved their dead Representative. It spread a pall of gloom over the entire community, and the condolences extended to the bereaved widow were deep and heartfelt. Sadly I saw his body placed beneath the sod, while grief was manifest on every face. Peace to his ashes; and may his life teach a lesson to those who come after him which will bring forth good fruit.

And the night dew that falls, though in silence it weeps,
Will brighten with verdure the grave where he sleeps,
And the tear that we shed, though in secret it rolls,
Will long keep his memory green in our souls.

On the Bill to Buy, Construct, Equip, Operate, and Maintain Merchant Ships in the Foreign Trade of the United States, and for Other Purposes.

EXTENSION OF REMARKS
OF
HON. EDWARD W. SAUNDERS,
OF VIRGINIA,

IN THE HOUSE OF REPRESENTATIVES,

Monday, February 22, 1915.

Mr. SAUNDERS. Mr. Speaker, the pending Government shipping bill is the most momentous proposition that has confronted the Democratic members of this body collectively and individually, since the advent of the Democratic administration. During the past two years we have passed a number of important measures, notably the tariff and currency bills. But the Democrats were committed to these measures by the declarations of many platforms. Reforms in these directions were familiar articles of the Democratic faith, and were prominent among the issues upon which the successful campaign of 1912 was waged. But the pending bill, that is the compound Gore-Weeks bill, presents a new principle, one never contained in a Democratic platform, and in my judgment both politically and economically unsound and unwise. This bill proposes Government ownership and operation in a commercial enterprise that will bring the United States into immediate competition with its own citizens who may desire to enter the field of foreign trade on the high seas. This enterprise will require many initial millions to set it on its feet, and holds out no hope of profit from its conduct and operation. No Democratic platform has declared in favor of Government ownership in this direction. Quite the contrary. Our last platform specifically indorses the "efficient supervision and rate regulation of railroad and express companies, and telegraph and telephone lines engaged in interstate commerce."

Contrast this plank with the plank in the same platform relating to a merchant marine, a plank that later will be cited in full. This plank favors the development of a limited merchant marine between this country and South America, through the exercise of the Federal power of "constitutional regulation of commerce." Regulation is the word used in the two planks, and in the common acceptation, as well as legal intendment, its meaning is the same in both connections. If the exercise of our constitutional power of regulation means that the Government is to buy and operate, or lease and operate ships on the high seas in a commercial venture, in a word, if regulation in this connection commits us to Government ownership to an unlimited extent in the field of foreign trade, then it will be an easy step in the argument to say that our platform relating to the regulation of railway and other companies, engaged in interstate traffic, commits us to the principle of Government ownership of railroads, express companies, telegraph and telephone lines, a contention that doubtless some one will make before the work of this Congress is concluded.

This shipping bill has been hailed with delight by Debs, Berger and other leading Socialists in the United States, and why not? It is a concession that their main contention is fundamentally sound. Enact this bill, and the Socialists, not the Democrats will have occasion to rejoice. Its passage may be a victory for the forces behind this measure, but the fruits of that victory will attach to an opposing organization, since our indorsement of their main contention will give an impetus to the development of their propaganda that nothing else would afford to the same degree. The Socialist contention that Government ownership and Government operation should replace private ownership and private operation, has not found favor in the Democratic Party, at least not up to the present time. For one, I am opposed to it. I believe in individual initiative, individual enterprise, and individual property rights, that is individual ownership. Hence my opposition to the pending bill which provides for Government-owned and Government-operated ships in the field of foreign trade. The Democratic Party has always favored the development of a privately owned merchant marine. Our last platform calls for such a marine, and the legislation of August 1914 was intended to lay the foundation on which private capital could build. The amount carried in this bill, great as it is, and capable of being applied to very great advantage in many directions of domestic utility, would buy a comparatively small fleet of merchant ships. Still they would be sufficient to chill the spirit of private initiative, and discourage and deter private capital from the effort to establish such a merchant marine as our platform contemplates.

As a Democrat, I am further opposed to this measure, for the reason that it is in flat contravention of the following plank of the platform adopted at Baltimore:

> We believe in fostering by constitutional regulation of commerce, the growth of a merchant marine, which shall develop, and strengthen the commercial ties which bind us to our sister Republics of the South, but without imposing additional burdens upon the people, and without bounties, or subsidies from the Public Treasury.

This plank plainly restricts our legislative activities in this direction to the exercise of our constitutional power to regulate commerce. The limited marine to be developed in this fashion, is to ply between this country and South America, and must be self-supporting, since we are neither to *impose additional burdens upon the people, nor to afford bounties, or subsidies from the Public Treasury*, in furtherance of its development. There is no hint in the language used, of a world-wide Government-owned, and Government-operated marine. Subsidies and Government ownership are alike excluded from contemplation. A scheme which requires an initial appropriation of $10,000,000, and an emission of bonds to the extent of a possible forty millions, not to speak of future appropriations on a large scale, inevitably falls within the condemnation directed against measures imposing additional burdens upon the people.

There are many grounds of objection to this measure that are not related to party considerations. Later, these objections will be presented in order. The restoration of our merchant marine is a somewhat misleading phrase. It carries with it the implication that at present there is no American merchant marine. Indeed the statement to this effect is often made in general terms. This is an extravagant misrepresentation, whether made in ignorance of the facts, or with a willful and vicious purpose to mislead. There are over 27,000, probably at this time 28,000 merchant vessels flying the American flag, and aggregating something over 8,000,000 gross tons. Of course the major proportion of this tonnage is in the coastwise trade, but registered for the foreign trade, there are 2,360 vessels, gross. To these figures must be added over 127 vessels admitted to the American flag under the recent registry act, having a gross tonnage of something like 400,000 tons, and constituting in themselves quite a respectable body of freighters. All of the latter vessels were operated in the foreign trade, and were owned by Americans who were driven to the purchase of foreign-built vessels, and the use of foreign flags, in order to escape the restrictions of our domestic laws.

In addition to the foregoing ocean-going ships, the authorities at Washington estimate that coastwise vessels aggregating between 200,000 and 300,000 tons, are available for use in over-seas traffic. These figures ought to allay the apprehension so often expressed, that in time of war this country would be unable to procure sufficient American ships to serve as colliers for the fleet. Having in mind the recent declaration of President Wilson, that our Navy has always been regarded as a proper and natural means of defense, and that it has always been of defense that we have thought, never of aggression, or of conquest, a statement which I believe represents the attitude of the great bulk of the American people, we may feel assured that at any future time when occasion demands, there will be available to be taken over for naval purposes, not only a sufficient number of American ships for a defensive war, but for any kind of war. It does not follow however that they will be taken over, if other ships may be chartered on better terms. It was not an evidence of national weakness, as sometimes suggested, that foreign vessels were chartered as colliers on the memorable globe-encircling trip of our fighting ships. The transaction was an ordinary business one, involving rates, and terms. If American ships had been insisted upon, with the same reckless disregard for expense that is such a feature of the Government Shipping Bill, American ships could have been procured. Another statement often made, is that there are no American sailors. They are alleged to have deserted the sea. The report of the Commissioner of Navigation shows that in 1908, the number of American and naturalized American sailors shipped, and reshipped on vessels of the United States, were as follows: Americans (born), 52,065, Americans naturalized 28,713. For the year 1914, the figures respectively were 63,247, and 31,417. The figures do not include seamen shipped abroad before consuls on American vessels. The explanation of the fact that there are not more merchant vessels engaged in the foreign trade under the American flag, may be found in the further fact that our laws have heretofore made such ventures unprofitable. The American capitalist, confronted with the problem of more expensive ships, and greater operating expenses than his competitor, could not play the game under the American flag.

The conditions were too unequal. Hence he went to sea under foreign flags, for reasons that will be hereafter given. There was nothing unpatriotic in this action. It was due to precisely the same economic causes that impel American capital to estab-

lish factories abroad, when conditions at home forbid the operation of a like factory at a profit. In both cases the capitalist acts under compulsion. For many years we have discussed the subject of a merchant marine, and the plans for its rehabilitation. Of course the obvious thing to do, was to repeal the entire body of laws that handicapped our capital in this direction. But for a long time neither party has apparently been willing to do this. The Republican Party naturally turned to subsidies in an effort to extend the protective, or bounty principle, to the high seas. This extension on a sufficiently comprehensive scale would undoubtedly have established a merchant marine. The handicaps imposed by law having been removed by the bounties provided by law, competitive conditions would have been restored. For many years subsidy bills on a tentative scale were introduced in Congress, but for one reason, or another, they were never successful. The latest offering in the way of a remedy is the Government-ownership bill.

This measure, like the subsidy scheme, proposes to use the Public Treasury to establish a merchant marine, but the ships are to be Government-owned, and Government-operated vessels. Individual enterprise and initiative will be effectually eliminated. The same comment may be made on this project, as on the subsidy device, namely, that if a sufficient use is made of public money in this direction, a merchant marine will undoubtedly be afforded. This country is able to secure any bauble that it craves, provided that it is willing to pay the price. But as compared with the subsidy remedy for a failing merchant marine, the Government ownership solution, contemplates a much more lavish use of Treasury funds to attain the desired end. It is obvious that as between furnishing the capital required to purchase, equip and operate a fleet, and furnishing only a sum sufficient to overcome the handicaps, and guarantee a dividend, a given appropriation from the Treasury will call into being a far greater number of ships under the subsidy plan, than this money would afford, if applied in the direction of Government purchase, and operation. But while this comparison indicates one manifest superiority of subsidy over Government ownership, attaining as it does the same end, by a far more economical route, this does not mean that subsidy is a thing to be desired, or a principle to be commended. The Democratic Party has consistently opposed both subsidy and Government ownership.

One project is not more desirable than the other. Subsidy is merely less undesirable than Government ownership. One argument often urged in behalf of Government ships, is that the Government will be able to fix the rates on these carriers. Undoubtedly this will be true, but it would be equally true with respect to subsidized vessels. If a subsidy is required to enable the ordinary merchant ship operating under the American flag, to earn a stable and satisfactory return on the money invested, then it is obvious that the authority which furnished the subsidy, would be able to fix the terms as to rates and service on which that aid would be extended. The Government-ownership scheme is neither so simple, nor so universally known as the subsidy plan, which has been before the country for a number of years. Various bills on this line have been introduced in Congress, and debated at great length in a number of sessions. But Government ownership is a plant of recent growth, one that has never been the subject of party discussion, or found a lodgment in a party platform. This latest plan for rehabilitating the merchant marine, made its bow to the public a few months ago, in what is known as the Alexander bill. The pending bill under the name of the Weeks-Gore bill, is an inartistic rehash of the Weeks bill and the Alexander bill. A brief description of the scope and intent of this measure, will be appropriate in this connection.

This bill is something more than a proposition to empower the Government to take stock in a private corporation, designed to operate merchant ships in the foreign trade. It goes much further. It is not near Government ownership. It is Government ownership in a transportation venture, or a series of such ventures, on the high seas. The Gore portion of the compound bill provides that the United States, acting through a shipping board, (and in this connection I may cite the familiar maxim, Qui facit per alium, facit per se) may subscribe to the capital stock of a corporation of the District of Columbia, to purchase, construct, equip, maintain, and operate merchant vessels to meet the requirements of the foreign commerce of the United States. There is no mistaking the plain meaning of the words used. The Government is empowered to secure its ships anywise, and anywhere, and then equip, maintain, and operate them in the field of foreign trade.

The bill also provides that the Government shall at no time hold less than 51 per cent of the stock of the said corporation, unless it shall dispose of all of its stock. The provision to this effect is that the United States shall subscribe to 51 per cent of the stock, and 51 per cent of each, and every increase of the same. Furthermore it is provided that when the Government has subscribed for 51 per cent of the stock, the remainder thereof shall be offered for public subscription at not less than par. In the event the same is not taken by private parties, the Government may further subscribe at par, for an amount of such stock, equal to that not taken by public subscription. The administration of the law will be in the hands of a shipping board, under the direction of the President. The initial appropriation is $10,000,000, and an emission of Panama bonds to a total amount not to exceed $30,000,000 is also provided for. The corporation may issue bonds not in excess of $40,000,000. It must be plain, even upon this simple statement, that sensible investors will not put their money into this enterprise. There is no guaranty of dividends on the stock reserved for the public, and no intimation given, that the enterprise is to be run with a view to making profits. Indeed the President in his message of December 8, 1914, seems to think that it is our national duty to afford the means of transportation, in advance of the development of our trade with our neighbor States of America. I quote his language:

> The routes of trade must be actually opened by many ships, and regular sailings, and moderate charges, before the streams of merchandise will flow freely and profitably. The Government must open these gates, and open them wide; open them before it is altogether profitable to open them, or altogether reasonable to ask private capital to open them at a venture. It should take action to make it certain that transportation at reasonable rates, will be promptly provided, even where the carriage is not at first profitable; and then when the carriage has become sufficiently profitable to attract, and engage private capital, and engage it in abundance, the Government ought to withdraw.

Confronted by this plain statement that ordinary business considerations of profit and loss will not be regarded in the operation of the Government ships, as well expect the fly to enter the spider's parlor, or the bird to be entangled in the net that is spread in his sight, as to entertain the hope that private capital will take stock in this Government enterprise. When will these lines become profitable, and when will private capital find it to their interest to take them over? Conceding that in time the Government vessels will develop a trade with South America that will furnish cargoes for merchant ships, is any assurance thereby given that private capital will find any profit in the competitive conditions under which these cargoes will be transported? Neither to-day, nor in the past, has our private capital been unable to furnish ships, or secure cargoes in the ocean carrying trade. The crux of the matter has been the ability of our competitors to underbid us at existing rates. There is nothing mysterious about the disappearance of our merchant marine from the high seas. That disappearance was due to very obvious and readily stated economic conditions. The would-be American shipowner was hopelessly handicapped by restrictive legislation that only recently, has been repealed in part. In the first place, as a result of this legislation, the prime cost of his ships which these enactments compelled him to buy in the United States, was greater than that of the vessels of his competitors. In the second place, his operating costs under our laws were greater. Under these conditions competition was hopeless. Inasmuch as the imposition of these restrictions was responsible for the disappearance of our merchant marine, the obvious conclusion is that the restoration of that marine should be sought in the repeal of the legislation which imposed the restrictions.

In other words, the "way to restore our merchant marine is to equalize competitive conditions," by first repealing the laws that created the inequalities. The subsidists seek to attain the desired result of equality through subsidies. On the other hand, the advocates of Government ownership would fain establish a marine that resting on the Treasury of the United States, would be able to defy competition by disregarding the element of operating loss. The simple method, one that is obnoxious neither to the criticism that is directed against subsidy, nor to the still graver objections that may be urged against Government ownership, is to afford American capital a free field, and no favors, on the high seas.

This course will in no wise interfere with the status of labor in the United States. But the protective system can not be applied to the unlimited competition which prevails on the ocean. Hence at present the American shipowner can not sell "transportation at the market rates." The passage of the registry bill was a long step forward, and removed the main stumblingblock in the way of the restoration of an American marine. The establishment of such a marine is not, as suggested by the advocates both of direct subsidy, and of Government ownership, a task beyond the ability of American capital. On the contrary for many years, a large amount of American money has been invested in merchant ships under foreign flags. Many of these ventures have been singularly successful. Indeed, "the foreign-

built ships representing American capital, but under foreign ownership of record, have been nearly equal in tonnage to the ships registered under the American flag, for foreign trade, and in carrying power, have been even greater."

The explanation of this is very simple. American citizens have always enjoyed the right to own vessels built abroad, and to operate them under the American flag in the foreign trade. But under the registry law these vessels could not enter the ports of the United States, save under heavy penalties.

For a third of a century this registry law has been "utterly impotent to promote the building in the United States of ships intended for the foreign trade." Hence American capitalists desiring to invest in ships for that trade, exclusive of the United States, bought their ships abroad. In the operation of these ships they were in no wise hindered by our laws, until they attempted to enter the ports of the United States. There they were confronted with heavy penalties, whether they were in cargo, or in ballast. This state of things compelled the American capitalist desiring to enter the carrying trade of the world on terms of equality with his competitors, to go a step further and take advantage of a provision common to the laws of all nations, that the owner of merchant ships flying their flag, must be a citizen, or subject of that country. A corporation however created under the laws of a sovereign State, is regarded as such a citizen, or subject.

Taking advantage of this holding, and with a view to using their foreign-built ships to engage in trade with the United States, our capitalists have in many instances organized corporations in foreign countries, retaining in their hands the control of the stock in these corporations. Thus in another name, and under another flag, American capitalists, driven to this course by the foolish restrictions of domestic laws, have entered the field of foreign trade, and prosecuted the same with profit and success. It is idle then to say that this same capital under equal competitive conditions which can be afforded by the United States, will be incapable of affording, and successfully operating merchant ships under the American flag. It may be admitted that subsidy universally applied, would equalize these conditions, but recourse to a subsidy is unnecessary, and undesirable. Not only in the past has the American capitalist seeking to fly the American flag on his vessels, been handicapped in the purchase of his ships for the ocean-going trade, but with respect to wages, berth accommodations, food, and other things costing money, he has been at a further disadvantage by reason of the positive requirements of our laws. In consequence of these handicaps, he has been driven from the use of our flag. There is nothing in Government ownership, that will operate to remove the handicaps falling within the latter class. Indeed, as these ships will not be operated with regard to considerations of ordinary commercial profit, it may be reasonably expected that in time the requirements in the above respect will be made more exacting, thus enlarging the effect of the handicaps, widening the gap between the operating expenses of American ships, and their foreign competitors, increasing thereby the advantage of the latter in the struggle for business, and in the result magnifying the charge upon the Treasury that Government operation, to accomplish the ends designed, will of necessity impose. Obviously the greater the loss at which these ships will be run, the greater the charge upon the Treasury.

So long as these handicaps exist, pray tell me when will the time arrive that private capital will be willing to assume them, take over the trade which the Government ships are intended to develop, and at the competitive rates then existing, pay the dividends that ordinary business sagacity would require to place the private venture on a paying basis? American capitalists would naturally prefer to operate under the American flag, but they can not afford to do so at a loss, being at a distinct disadvantage in this respect with the Government ships. Until conditions are equalized, the Government lines which carry freight at a loss, will never be replaced by private lines. The hope that such will be the case, is an iridescent dream.

A plentiful supply of ships will not necessarily secure trade. Ships and rates and service are all required to attain this result. Will the Government ships be able to meet, or underbid the ships of their competitors, and at the same time be operated at a profit? This is a question no advocate of this bill has undertaken to answer in the affirmative. But the taxpayers who will have to foot the bill, are intensely interested in the answer to the query. The President who will have paramount authority over the practical administration of the law, frankly suggests many ships, and lines to be run at a loss, until in some unfixed, and probably remote period of the future, the enterprise will become profitable. Then the Government is to withdraw. It it is agreed that Government ships under the conditions of open competition on the high seas, will be operated at a loss, then to what extent, and for what length of time will the people of the United States be willing to support this loss? How long will they be willing to see domestic interests, and domestic development intimately related to the whole economic fiber of the country, starved and stunted to afford the means to maintain this fad of a Government marine, this costly toy that neither the farmers, nor the commercial interests of the country have demanded, but which they are asked to support, to the exclusion of legislation in which they are vitally interested, and upon which they are clamorously insisting?

Why is the legislation plainly demanded by our platform, neglected, disregarded, and set aside, in favor of a scheme that is palpably and unmistakably opposed to the terms of that instrument?

American commerce includes both imports and exports. Neither the American nor the foreign exporter will use the Government ships unless, as has been indicated, these ships as to rates, sailings, and facilities meet the ships of their competitors on equal terms. No amount of rhetoric over a waning merchant marine, no confusing mass of bewildering figures, should be allowed to becloud the fundamental factors of this problem which are that cheap ships, must be met with cheap ships, and moderate operating expenses, with operating expenses equally as favorable. If Government ships will be able to meet these requirements, then the conditions will be equally favorable for privately owned ships. The Commissioner of Navigation has pointed out that the vast expansion of the German merchant marine was due to cheap ships, and cheap labor. Cheap ships under recent legislation are within the reach alike of private capital, and of Government enterprise, but Government ships are not likely to furnish an illustration of economical operation, or cheap labor. The head of one branch of the present Government has recently indicated his ability to effect an annual saving of many millions in his department, without detriment to the public service, provided he is allowed to contract with private persons.

No, Government ships will not mean cheap labor, or reduced operating expenses. Hence they will not solve the problem of labor competition, and until that problem is solved, Government ships will be operated at an inevitable loss. Moreover should the foreign Governments hereafter subsidize their merchant ships, and thereby enable them to afford even lower rates than exist under normal conditions of competition in the ocean-going trade, our Government ships must meet that competition with equal rates. This will mean a consequent increase of operating loss, and of burden on the Treasury. But if it is insisted that these ships may be, and will be, run at a profit, though the method of that process has not been indicated, the reply is easy, that the way to such profitable operation, if it exists, is as open to private capital, as to public enterprise.

The argument that this enterprise is too great for private capital, using as an analogue, the construction of the Panama Canal, is singularly fallacious. The construction of the Panama Canal was placed on the ground of an alleged military necessity. It was a part of an alleged scheme of national defense. Considerations of commercial return have been totally disregarded in the prosecution and maintenance of that enterprise. Its construction was beyond the ability of private capital merely in the sense that private capital would not have been available for a work that offered no inducement of return on the money invested. If dividends had been guaranteed, private capital would have been forthcoming. But it will be an ill day for the advocates of this new departure in Government activities, if it is conceded that in a commercial sense, having in mind the money invested, and the possible returns on that investment, Government ships will entail a greater, or even as great a charge on the Public Treasury, as that military enterprise known as the Panama Canal. But to return to the suggestion that this field is too vast to be occupied by private capital, a suggestion intended to support the argument that the one solution of the present problem, is Government ownership. Apparently this field has not been beyond the powers of foreign capital. Is this country so lacking in capital and commercial ability, that in the United States the Government must undertake the tasks that are realized abroad by private enterprise? How many of the thousands of merchant ships flying the flags of Great Britain, Germany, France, Norway, Sweden, Russia, Japan, Spain, and other countries, are Government ships? Practically none of them. Comparatively speaking a few of these vessels are under military contract, and the remainder, constituting the great bulk of the world's merchant fleet, are

privately owned, and privately operated. If it is maintained that Government ships can be operated at a commercial profit, it behooves the advocates of this enterprise to point out why the road to this result will be closed to private capital which, in the matter of securing ships, and operating the same, will certainly, to say the least, be on an equal footing with the Government. And if in the future under the legislation already afforded, and that which may be afforded by the present Congress, private capital using the American flag may profitably operate *merchant* ships on the high seas, what occasion, or necessity is presented either on business, or political grounds, for so violent a departure from established Democratic principles, as the inauguration of Government ownership in the conduct and operation of a merchant marine?

Surely if the opportunity of profit is afforded, it is not beyond the ability of American capital to furnish a merchant fleet of sufficient size to enter the carrying trade of the world. The modest fleet that would be purchased with the amount carried in this bill, would admittedly make but slight impression, under any circumstances, on a carrying trade now conducted by over 20,000 vessels and amounting to over 49,000,000 tons. Even if these Government ships were now in service, they would in no perceptible degree improve conditions that are due to abnormal causes. If the expenditure in this direction is to be limited to the appropriation in the present bill, then the game will assuredly not be worth the candle. If, on the other hand, this is but the initial step under an ambitious scheme of indefinite development, how many hundreds of millions will be taken from the Treasury in furtherance of this project? Our party platform commits us in this connection to the use of our constitutional powers of regulation of commerce to foster a merchant marine which shall develop and strengthen the commercial ties that bind us to our sister Republics of the south, without imposing additional burdens upon the people, and without bounties or subsidies from the Treasury. Will the prodigious appropriations attendant on the development of this enterprise, be regarded as a constitutional regulation of commerce, free of burden for the people? The shipping business is sometimes referred to as a colossal trust which we are to attack with Government ships. But a colossal trust will require a colossal force for its overthrow. A colossal attacking force, means a colossal expenditure.

If we are to attack the trust monster on the high seas with a mobile array of ships, at least set down in black and white, what will be the probable ultimate cost of this enterprise?

That portion of the appropriation carried in this bill which will be available for the purchase of ships, after providing for terminals, operating expenses, and other necessary incidental features of the enterprise, will afford but a trifling fleet with which to challenge our competitors for the carrying trade of the world. The effect of such a fleet upon general conditions would be entirely negligible. Additional ships would require additional appropriations on a large scale from the Public Treasury. The use of these ships will certainly not serve to aid the development of a private merchant marine. On the contrary, they will be a distinct check upon the development of such a marine.

One claim often made for these ships, is that they will be used to effect moderate charges in the ocean carrying trade. How will they be utilized to effect that end? Will privately owned ships which must earn enough to pay operating expenses and dividends on the investment, and provide a fund for replacement, be in a position to compete with ships that will be able to boldly disregard these considerations? Will the *Government ships* charge the rates established by their private competitors, or will they underbid them, without regard to the conditions which establish those rates? How can "Government ownership, combined with Government management," be to the advantage of investments already made in shipping, or how will they serve to induce further investments, when the conditions of competition between the two ownerships, will be so distinctly unequal? If rates are thought to be too high at a port, will Government ships be sent there to reduce them, and afford a lower carriage? Even under the theory of this bill the number of Government ships for many years to come would be comparatively small. Hence they would be inadequate to afford moderate rates to all of the American shippers seeking transportation. Moreover the advantage of the reduced rates thus afforded, will be at the cost of the general taxpayers, and to the distinct disadvantage of the shippers who will be unable to secure a place on the Government ships. How will the Government determine between competing shippers, and ascertain who should be taken, and who should be left? All will be equally entitled to the service, and even should this policy be inaugurated, and vigorously maintained with lavish appropriations, it will be long ere the supply of Government ships will be sufficient to afford general service, or affect the general average of rates to any perceptible degree. How will the Shipping Board use the meager supply of ships that the initial appropriation will afford, to effect the double purpose of securing trade with South America, and steadying rates in the trans-Atlantic, and trans-Pacific fields? Should abnormal and unreasonable rates prevail at any port, or ports, on either seaboard, will the Government ships be withdrawn from their regular sailings on the South American lines, and hastened to these ports to reduce, so far as possible, the exeessive rates? Otherwise, how will these vessels be used to steady conditions, and maintain regular and moderate rates at the various ports of the United States?

It is the fond dream of some of the advocates of this bill, that Government ships will protect them, and all future American shippers, against those fluctuations in rates which proceed in most cases from sufficient natural, and economic causes. With this end in view, as the goal to be obtained through Government ownership, it is apparent that we are but at the threshold of our appropriations under this head. To attain this result, conceding that it is feasible, a gigantic fleet will be required, calling for vast appropriations to provide both the original ships, and furnish replacements from time to time. The opponents of ship subsidy, who are supporting the Government-ownership bill, seek in vain to establish the consistency of their attitude. With uplifted hands they declare their eternal and unshakable opposition to subsidy in any form, and almost in the same breath commit themselves unreservedly, to a measure which combines the fundamental principle of Government aid, with other and far more objectionable features. Ship subsidy was an endeavor to apply the principle of the protective tariff to the ocean carrying trade. It frankly announced its purpose to use the Public Treasury to secure in the ultimate, certain alleged large results of public welfare, and national prosperity. The justification of this use of public funds was the end to be attained. The alleged public benefit was to be of so universal and comprehensive a character, that the advantage to be given to the private shipowner in the conduct of his enterprise, was regarded as a negligible incident of the entire scheme. These same results of public benefit on a nation-wide scale, are claimed for the Government-ownership bill, which proposes to maintain steamship lines out of the Public Treasury, and charge the inevitable attendant losses upon the whole people.

One basic principle common to both projects, is that in consideration of the public gain from the stimulus to be afforded to industrial enterprise, and the ultimate reestablishment of a merchant marine, the General Treasury should be utilized to secure these results. Hence inevitably the advocates of Government ownership can not in principle, and good logic, justify their antagonism to subsidy, though the subsidists may consistently oppose Government ownership, since the latter scheme superadds to the principle of Government aid, other and far more dubious and undesirable features. I am aware of the hair-splitting distinction presented by the advocates of Government ownership, in their efforts to distinguish the two propositions, but the defense is purely technical, and ignores the real merits. Both schemes contemplate the use of public money in a commercial enterprise, upon the alleged ground of far-reaching public benefit. In both cases, the public is to pay the bill. Neither enterprise will yield any return to the Public Treasury directly, or indirectly.

It is frankly claimed in support of both propositions that the Government ought to utilize its resources, that is to say the Public Treasury, in such manner as will inure to the benefit of all the people. Having in mind then that the fundamental appeal in behalf of both propositions is the same, it follows that the efforts of the anti-subsidists to maintain their position that subsidy is vicious and unsound, while Government ownership is a proper and desirable exercise of Federal authority, requires a power of subtle analysis, and acute differentiation, exceeding that of the scientist who "could distinguish and divide, a hair 'twixt south, and southwest side."

Moreover it will be noted that the ground now taken in behalf of this measure, is in conflict with the attitude of the President as expressed by him in his message on the Panama Canal tolls. In his message of March 5, 1914, urging the repeal of that provision of the Panama Canal act of August, 1912, which exempted vessels engaged in the coastwise trade of the United States, from the payment of tolls, the President stated, among other things, that in his mature judgment, the exemption constituted a mistaken economic policy, from every point of view. The argument briefly stated, for the remission of tolls on coastwise traffic, was that such a policy would stimulate enterprise in our coastwise trade, would develop business in our coastal cities along many lines of profitable industry, and would furnish to consumers generally, the benefit of low rates on all merchan-

dise passing through the canal, and related to our immense internal commerce. In view of these extensive results of public advantage, it was urged that as to coastwise traffic, the general public should carry the burden entailed by a remission of the tolls upon this traffic. The advocates of repeal assailed and rejected this argument, though it is identical in substance, with the one now advanced in support of the present scheme of Government purchase, and operation of merchant ships. Concede that under our present laws, American capital can not profitably operate merchant ships on the high seas, and it will be at once apparent that the Government, owning and operating such ships under the same laws, and the same conditions, will confront an inevitable pecuniary loss, so that the enterprise will be, in essence, a charge on the Public Treasury. Hence the argument for this project, and the argument for the remission of tolls on coastwise traffic, are precisely the same, namely, that the Public Treasury should carry the burden of an enterprise which, in the larger view, is alleged to be for the benefit of all the people.

But if this contention is sound as to this enterprise, then there are many others, ready and waiting, to be taken over by the General Government. Once admit that the Government is justified in conducting an enterprise of a public character, on the ground that the lower rates afforded, will not only benefit that portion of the public which pays those rates, but in the result, will stimulate the general welfare and prosperity of the country at large, and you have conceded a fundamental tenet of socialism.

There are many projects of Government ownership that may be tried out, if it is once conceded that it is a sound economic policy for the Government to conduct public service enterprises, without regard to the usual considerations of profit and loss, the one determining question being to afford the public lower rates than can be afforded by private capital engaged in a like enterprise. Some of these projects are coal mining, to furnish cheap coal, hydroelectric enterprises, to furnish cheap light and power, milling plants, to furnish cheap flour, and cheap meal, packing-house industries, to furnish cheap meat, and canning factories to furnish cheap canned products. Of course a Government operation that can saddle its losses on the Public Treasury, has an enormous advantage over a competitor that must seek to attract capital by offering a reasonable return on the money invested.

The question of the constitutionality of this scheme might well be raised, if time admitted, since the major portion of the ships that this bill is intended to provide, are not for the purposes of national defense, but for use in the ordinary course of foreign trade. As a counter to the objection that the Government will furnish this service at a loss, the reply is sometimes made that the operations of the Post Office Department are not conducted at a profit. But the cases are not analogous. To conduct and maintain a postal service, is an express Government function. It is not a function of the Federal Government to take stock in a chartered corporation, and conduct a competitive transportation enterprise on the high seas.

A Government marine will inevitably become a Government monopoly, and as it waxes in the domain of foreign trade, the private marine will wane. It is secure against competition, and once in possession of a field, it will hold the same to the exclusion of private capital, which is unable to disregard the element of loss in its ventures.

The mission of the Government ship, according to the forecast given of its purpose, is to open up trade, even if unprofitable rates are to be charged, and as a sort of knight errant, to reduce all rates deemed to be unreasonable. Such a ship is not engaged in a mercantile venture in the usual acceptation of the words. It is neither purchased, nor operated with a view to a profit on the money invested. Between such a vessel, and one that must have in mind a return on the prime investment, the conditions of competition are decidedly unequal. Indeed it may be fairly said, that competition between such vessels, will be impossible. Concede that the Government ships, in the public interest, should afford reasonable rates, even at a loss, and it would seem to follow that the minimum rates would afford the maximum public service. Hence a constant pressure will be exerted by the exporters, the importers, and the consumers generally, under the specious plea of the general interest, to reduce the rates for service on the Government vessels. The exporters of a Nation which affords cheap carriage, will certainly be able to underbid their competitors for the trade of the world. Hysteria, misinformation, and hasty judgment, are responsible for much of the local sentiment in favor of Government ships. For instance at this time the rate on cotton for Bremen is very high. Straightway the specious argument is advanced that Government ships would reduce those rates, and advance the price of cotton. How, and in what way. These ships would operate under the same conditions, and incur precisely the same risks as private ships. The rates to Bremen are high for the manifest reason, that the dangers of the voyage are very great, and the risks to be incurred are unusual. For one thing, the North Sea is full of floating mines, and within the last few months various neutral ships carrying cotton, have been destroyed by collision with these mines. Private owners are unwilling, and reasonably so, to take these risks, as well as the additional risks of search and detention, at the rates prevailing before war was declared. Under these circumstances high rates are inevitable. Would a Government ship ignore these risks, and without regard to mines, search, or detention, carry her cargo at the ante bellum rates? Ordinary business foresight should not be disregarded, even in the management of a Government ships, and in the exercise of this foresight, such rates should be charged as will be reasonably commensurate with the risks to be incurred. The high insurance rates prevailing since war was declared are one compelling cause for the advance in freight rates. For instance the insurance on a round trip to England on a ship and cargo valued at $1,000,000 is $100,000. Such an insurance charge renders inevitable an advance in freight charges.

There is no sufficient evidence to show that the high rates to Bremen are due to any shortage of ships, or to any other cause than the dangers attendant upon a present trip to that port. If the ocean rates are high to-day, they are due to abnormal causes. "A high level in rates is always coexistent with a general war, and can never be covered by the building of new tonnage during the war." Having in mind the aggregate number of neutral ships in the world now engaged in the ocean-going trade, and the number of ships of the allies that are free to ply the ocean routes, the ships that could be purchased under the appropriation provided by the Alexander bill, would make no impression either on rates, or on general conditions. The total number of ocean-going steamships, the world over, of 100 tons or more is over 23,800. Deduct from these the German and Austrian ships (2,523) and the remainder is 21,277. Deduct from this remainder an estimated number of 1,000 English, French, and Russian ships destroyed, or withdrawn from commercial work, and there will still be available for cargo-carrying purposes, 20,277 ships. "The destruction of practically all of the hostile ships lately preying on nonneutral tonnage, will also tend to restore to regular service the ships that were temporarily withdrawn from that service," and thus aid the tendency to a lower basis of freight rates. If a proportion of ships have been withdrawn from trade, it must not be forgotten that a simultaneous withdrawal of cargoes also occurred. If there are fewer ships to-day, there are fewer cargoes to be served. Hence in view of this shrinkage in business, I feel well assured that there is no real shortage of ships on the whole, and that so far as numbers are concerned, the present ships are adequate to handle the present traffic, when cargoes and rates are assured. Prior to the war there were more ships than are at present in service, but the traffic was far greater.

One sufficient explanation of the temporary accumulation of export cargoes in certain American ports, has been the difficulties and delays with which cargo ships seeking to unload in foreign ports, have been confronted. Many vessels have been compelled to lie at the docks in Liverpool, London, and other ports for several weeks before they could discharge their cargoes. The congestion of traffic in those ports has been largely due to a shortage in dock laborers, and to the requirement that ordinary commercial traffic must yield to traffic related to the military situation. Government cargo ships would not meet or rectify this situation, since they would be compelled to wait their turn at the docks. These delays at the ports of discharge mean serious losses to the cargo carriers, and compel them to advance their rates to secure reimbursement. Government ships would be compelled to do the same thing, or else charge their loss to the Public Treasury, thereby increasing the burdens of the general taxpayer. Delays in unloading at the ports of destination, inevitably cause temporary accumulations of goods in the ports of export.

The high rates to Bremen from Galveston and other American ports, have been due not to lack of ships, but to danger to ships on the voyage, caused largely by floating mines, a menace that has caused Dutch pilots to refuse to take neutral ships into German ports. Remove these dangers, and the Bremen rates would decline to the present level of ocean rates. Once make it as easy for cotton to reach Germany, as England, France, or Italy, and the price of cotton in Germany would fall to the level of prices prevailing in those countries, and in the world generally. Hence Government ships to Bremen would not increase the prices of cotton to the cotton

producer in the South. If the rates to Bremen were not anomalous rates, due to abnormal causes, and commensurate with the risks to be incurred, there would be a rush of cargo ships from every portion of the globe, to take advantage of this peculiar and unusual get-rich-quick opportunity. But the foundation for this misleading and fallacious cotton argument will soon disappear, for the price of cotton is advancing, while cargo rates for this particular product will gradually become normal, provided the risks of the voyage are eliminated.

Cotton was more severely affected by the war than any other American product, and its recovery has been proportionately slow. Hence the seductive appeal that has been made to the cotton producers to support this Government-ownership proposition.

Information as to the alleged shortage of ships at Galveston for export cotton, is to the effect that various steamers left that port in ballast, for lack of cargoes. One ship seeking cotton cargo freight left Galveston in ballast for Portland, to take on a cargo of wheat for Europe. The truth is that cotton exportation was demoralized through the falling prices, and the disorganization in financial channels. The immediate decline in cotton upon the outbreak of the war was due to very obvious facts, the two main facts being that the German and Austrian markets were closed, while the English spinners agreed not to purchase for the time being, for the manifest reason that they could not afford to purchase on a declining market. Of course this action accelerated the decline until bottom was touched. Since then under improved conditions, and renewed purchasing, cotton has steadily advanced. It is now 9 cents in New York. Naturally, however, the cotton planters, and cotton dealers under the pressure of exasperating conditions due to causes beyond their control, have been disposed to listen to any alluring scheme that confidently promised relief. Cotton is high in Germany for the simple reason that it is difficult to get cotton into Germany. The German buys his cotton in the United States for the same price as his English competitor. The price in Germany is the price here plus the freight. But the German pays the freight. The price of English goods in this market is the price in England plus the freight to America. The American consumer pays the freight. Reduce the freight to Germany, and the price of cotton in Germany would fall. The price here would not rise, except to the small degree that lower freights would enable the German market to take more cotton. An increased market elsewhere would have precisely the same effect on general conditions in this country. A much more certain, direct, and effective way of benefiting the cotton growers, would be to distribute amongst them a sum equal to the cost of a few steamships.

It is a significant fact that the industries that have been stimulated by the hostilities abroad, have not been clamoring for Government ships, or complaining of a lack of transportation facilities. Since the outbreak of hostilities the sale of automobiles for war purposes has been over $9,000,000, while the total of war business in iron and steel is estimated at $41,000,000 to date. Exports of woolen goods to supply war orders began at $296,940 in August, and reached the sum of $3,047,000 in November, the aggregate to January 1, 1915 being probably $8,500,000. The export of leather products for military purposes totals to January 1, about $33,000,000. Sugar exports have also been active, totaling probably to date about $17,000,000.

Wheat exports totaled in December 1914, 28,875,470 bushels, or five times the quantity in December 1913, the average export price being $1.25 in December of this year, as against 98 cents one year ago. Are the wheat farmers complaining of prices, or asking for Government ships. The flour exports for December 1914 were $9,473,660, as against $4,903,223 in December 1913. Oats showed a larger total in December than during the entire calendar year of 1913, being 5,203,431 bushels, as against 30,798 bushels in December 1913.

The corn exports for December 1914 were 4,582,006 bushels, valued at $3,554,592 as against 749,124 bushels valued at $560,165 exported in December of the year before.

There are no marching armies of corn farmers knocking at the doors of Congress, and demanding Government ships.

The figures for fresh beef exported in December of last year are 6,594,348 pounds, as against 524,430 pounds in December 1913, and 6,618,831 during that entire year. In view of the phenomenal gains in our export trade, the Department of Commerce has announced that during the month of December this trade attained regained the high level of the period preceding the war. Some ships from somewhere, American or otherwise, must have transported these huge freights. Government ships purchased from neutral nations would not add a ship to the world's supply of cargo carriers available for present purposes. Zinc exports have also advanced, while the advance in the exports of mineral oil has been phenomenal. The figures for the latter from August to January 1 are about $52,000,000. A gigantic trade in breadstuffs has also marked the last five months, the total being not much short of $200,000,000. The larger portion of this trade was in wheat, the value of which amounted to something like $120,000,000. Two other trades that have been immensely stimulated, are the trade in horses and in munitions of war, the figures for the former being about $8,000,000. All of this vast commerce has been successfully moved, in spite of the clamor about a lack of ships. Neither the wheat farmers, the horse raisers, the steel producers, the shoe manufacturers, nor any of the other trades which have benefited by the war, have joined in the outcry for a Government marine, either to move their products, or to attack the alleged trust in the ocean carrying business. The value of water-borne commerce of the United States, for the last fiscal year was the prodigious total of $3,785,469,000. War caused only a slight falling off in the amount of American goods carried in British ships.

The immense mass of undigested and unrelated figures, and statistics relating to our foreign commerce, and to conditions in the ocean carrying trade that have been adduced by the advocates of this measure, serve for the most part merely to mislead and confuse. Of what avail are bitter criticisms of the alleged trust in the trans-Atlantic lines, when it is not proposed to attack this monopoly through competing lines of Government ships? The only one who can speak with authority as to the purpose of this bill, (for the action of the shipping board is subject to his approval), is the President of the United States. The prodigious scope now sought to be imputed to the pending measure, finds no support in his message of December last. After a general reference to the empty markets which we should undertake to supply, and this reference would not apply to the markets of Europe served by the great ocean-going lines, he descends to details, and suggests that the routes of trade must be opened between this country and South America by many ships, and regular sailings, and moderate charges, in advance of any hope of present profit. When the profit accrues, the Government is to retire. This then, in the view of the President, is the task to be discharged under the authority of the Government shipping bill. There is no suggestion of an attack upon the trust octopus in the North Atlantic, or that the Government ships, if they were available, would be used to brave the terrors of the mines in the North Sea, in order to reduce the cotton rates to Bremen for the benefit of the cotton producers of the South, or to reduce the rates elsewhere, for the benefit of the naval stores of Florida, or of the manufacturers of the country generally.

I do not know in what form the alleged opposition of the railroads and trusts to the shipping bill has been manifested. Certainly no protest emanating from them, or from any interest affiliated with them, has been lodged with our committee. But I do know that the chambers of commerce of city after city on the Atlantic seaboard, and the Chamber of Commerce of the United States, organizations which are composed of the foremost men concerned in the industrial activities in which those cities, and the country generally are interested, have protested in the most vehement and emphatic terms against this measure. The great journals of trade are against it, as well as the great bulk of the independent and nonpartisan papers that reflect the attitude of the business world. In this connection I cite the Journal of Commerce, and the Scientific American published in New York, and the Manufacturers' Record, published in Baltimore. Surely if this bill had a tithe of the merit claimed for the same by its advocates, the benefits flowing from its passage would descend in the very largest measure upon the port cities of the country. Yet the representative bodies, and the representative thought of these marts of trade and commerce, seem to regard this measure as a Trojan horse that will bring mischiefs, not benefits, to their communities. Recent figures show that in spite of the tie-up of ocean shipping during the early period of the war, and despite the reduced purchasing power of the nations that are affected both directly and indirectly by the war, in their ability to take our exports, the volume of trade of this country for the year 1914 was astonishingly large. Our imports for 1914 were $1,789,022,426, as against $1,792,596,480 in 1913. Surely the ships that brought to this country the goods representing this gigantic sum, have been available for the return traffic, a traffic which fell far short of the figures of 1913, due to the reduced purchasing power of our foreign customers!

Every carrier is on the lookout for a return cargo, and the ships that handle our imports, will not return by choice in ballast. Evidently the ocean has not been bereft of carriers during the last 12 months, since in addition to handling the trade of other countries, they have brought to this country alone, goods

to a value exceeding one and three-quarters billion of dollars. On February 20, of this year five ships left New York for European ports carrying cargoes aggregating $19,000,000.

As far back as August 20, 1914, a leading ship broker of New York, Mr. L. L. Richards, in a letter to President Wilson, which is filed with the minority report, stated that the claim then preferred that transportation for the products of the United States could not be procured, was unquestionably contrary to the facts. He affirmed that transportation was available, and plenty of it, but that the difficulty in the way of the merchants was one of credits and exchange, with only a limited amount of buying orders. Mr. Richards added: "The practical situation at present is that there are more steamers offering, than cargoes available. We have great difficulty in getting any definite proposals at all for boats, especially for shipments to South American business, but at this moment, one can count on his fingers, the actual definite orders which merchants hold for steamers." Since that time the situation has steadily improved. The menace of German cruisers has definitely disappeared, and the volume of available steamers is fully equal to handling the reduced volume of the world's commerce.

In support of the contention that ships and cargoes are in the same relation of proportion as before the outbreak of the war, and that a shortage in the one, has been paralleled by a corresponding decline in the volume of the other, I wish to call attention to a statement recently issued by the customs administration of the French Government, showing that the exports of that country have diminished in value to the extent of $400,000,000, in 10 months of 1914, as compared with the same period of 1913, although every port of that country is open, and active efforts have been made to maintain and extend their trade. The volume of commerce throughout the world generally has been affected in the same harmful way. In Germany and Austria the decline has been more violent and extensive than in France, but the figures are not available. The advocates of Government ownership, in their eagerness to advance this cause, talk volubly about the interned German, and Austrian ships, and of the English, French, and other vessels that have been destroyed. They are painfully silent on the equally important factor in the equation, of the coincident decline on a gigantic scale, of ocean-borne commerce. Fewer ships, yes, but fewer goods to be transported. This is the story of ocean transportation under present conditions.

There are many misconceptions, relating to the extent of subsidies paid, and the effect of same, upon the merchant marine of foreign countries. The latest available figures show that the United States pays subsidies in the way of mail pay, $2,695,287. These payments are made under the ocean mail act of 1891.

It is often said that the merchant marine of Great Britain is maintained by subsidies. Nothing can be further from the fact. The subsidies paid by that country are chiefly under the head of mail pay, and are designed to make the ships to which they are paid, parts of the British Navy in the event of war. The ordinary merchant carrier receives nothing from the parent Government, and is dependent upon its own exertions to find business, and pay dividends. Military features are contained in practically all of the great ocean mail contracts of foreign countries. France and Spain pay the largest navigation bounties, and in the matter of merchant marine they are inferior to a number of their European competitors. England has 11,328 ocean-going vessels of all sorts, of 100 tons and over, and in subsidies and mail pay for the parent country, and all the colonies, she expends the sum of $9,689,384, or something over three times the amount paid by the United States under this head. By far the larger proportion of the payments made by Great Britain are for mail pay under military contracts. In the same year for which the above figures are given, Germany paid for mail subsidies only $1,706,460, or less than that paid by the United States. Yet the German merchant marine is second to that of Great Britain. France which has a merchant marine inferior to that of England, Germany, Japan, Norway, and Sweden, pays more in the way of subsidies than any other nation in the world. Her payments on that account being $13,423,737. These figures reveal the utter hollowness of the contention that the great carrier nations have built up their merchant marine through a system of universal subsidies. Enterprising men in those countries have built cheap ships, reduced their operating expenses to a minimum, and thus equipped, have gone on the hunt for ocean freight.

The statement that the Government must grapple with this problem as being one beyond the ability of private enterprise, is a trifle ludicrous in the light of the facts. Of course any enterprise that is made impossible of profit by destructive legislation is, in a sense, beyond the reach of private enterprise, since private capital will not be invested under such conditions; but there is no profit-bearing enterprise that presents a problem incapable of solution by American capital. Some years ago a single capitalist in Chicago offered to take over the entire operations of the Post Office Department. No one ever doubted that he would afford a service fully equal to that rendered by the Government, at a handsome profit to himself, and an annual saving of many millions to the Public Treasury. This is the richest country in the world, as shown by the following table of the estimated wealth of the great nations, for the year 1914:

United States	$150,000,000,000
Great Britain and Ireland	85,000,000,000
Germany	80,000,000,000
France	50,000,000,000
Russia	40,000,000,000
Italy	20,000,000,000
Spain	5,400,000,000
Netherlands	5,000,000,000

In view of these prodigious figures, in contemplation of this wealth that exceeds that of Great Britain and Ireland by $65,000,000,000, who will undertake to say that any enterprise in which England has succeeded, is beyond the powers of private capital in the United States? Just as in war the weight of the greater mass, properly directed, will tell against an inferior opposing force, so in any field of competition under equal conditions, will our excess wealth of $65,000,000,000 over that of the richest nation of Europe, assure success. What England has done with $85,000,000,000, we can do with $150,000,000,000, now that the bars are down, and our capital is free to buy its ships where it will. If further aid is needed to equalize conditions, that aid in conformity with our platform, must be afforded in the exercise of our power of constitutional regulation. Why say that private capital in the richest nation in the world is unequal to the task of furnishing a merchant marine, when little Holland with a wealth of $5,000,000,000, has a private merchant marine of 806 merchant ships, with a tonnage of 1,500,000 gross tons.

So far as this country is concerned, our competitors have simply underbid us, by using modern steamships which have been built more cheaply abroad than in the United States. Our domestic laws have hitherto precluded American capital from the use of these vessels in the American trade.

The recent registry law has removed the handicap of cheap vessels, but the other handicaps still remain to confront private capital, as well as Government ships. It is certainly true that the operating expenses of Government vessels will be much greater than those of privately owned ships. Congress would soon be called upon to fix the wages, establish the hours, and improve the accommodations, of every employee on these ships. We will be compelled to legislate in relation to them, just as we are legislating to-day with respect to rural carriers, city carriers, naval and military employees, and many thousands of other servants of the General Government. One main purpose of Government ships is avowed to be to maintain moderate rates. This being so, such ships will not be in a position to take advantage of advancing rates, to meet an increase in their operating expenses. Should they charge rates not deemed moderate, they will fail to accomplish the purpose for which they are intended, namely, to furnish carriage, and steady rates in the whole ocean-going trade.

The most incredible claims, and extravagant statements have been advanced by the various advocates of the Government-ownership bill. For instance in a document included in the Senate report on the shipping bill, I find that the assertion is made—

> that the $40,000,000 carried in the bill, will not be an expense, but will be an investment of the first class, without considering the enormous advantage to the whole people of the United States, in having an American merchant marine under Government control, and the great reduction in rates that will be possible, as the Government will not desire net earnings of from 30 to 40 per cent on its investment, but will be content with only a fair return.

If it be true that from 30 to 40 per cent net earnings may be secured from an investment in merchant ships to ply the high seas, I wonder that any portion of the abundant surplus of American capital that has been eagerly seeking investment in every direction, has been content with the modest returns that investments on land have yielded during many years past.

The field of the sea has been freely open to the shrewd and able men who handle that capital, and it is a reflection upon their intelligence, that they have allowed such golden opportunities to escape them. With such profits in sight, capital operating even under the handicaps of the American flag would have secured a highly satisfactory return. But against the foregoing contention of possible profit for the Government ships, I set the statement of the President's message, to the effect that the Government ships must open the gates, and open them wide; open them before it is altogether profitable to open them, or altogether reasonable to ask private capital to open them at a

venture. And with his further statement that the Government should take action to make it certain that transporation at reasonable rates will be promptly provided, even when the carriage is not at first profitable; and then when the carriage has become sufficiently profitable to attract and engage private capital, and engage it in abundance, the Government ought to withdraw. The plain intimations of the message are that the Government ships are neither to enter upon the routes which are at present profitable, nor to remain upon the routes that become sufficiently profitable to attract private capital. But if these ships are to furnish facilities for the transportation of prospective and problematic cargoes on new routes, how will they be able to serve the purpose of reducing rates on established routes, and in addition, afford that steadiness of control which the Senate report alleges will contribute an element of aid to the privately owned transportation lines? How shall we reconcile the conflicting claims that are made for this measure, in the hope of securing support in a variety of quarters. For instance the Senate report declares that the bill will "create work for our shipyards in the construction of ships." This is a bid for the support of the shipyards. But it is a well recognized fact, indeed a postulate in this whole discussion, that the chief agency in the destruction of our merchant marine has been the requirements of our registry laws which have barred the way to the purchase of the cheap ships built and operated by our foreign competitors.

The legislation of August, 1914 was designed to remove this handicap, and permit American capital to purchase its ships abroad, and with these ships to enter American ports, and participate in American trade without let or hindrance. The Commissioner of Navigation pointed out some time ago that German capital without subsidy, by means of cheap ships, and cheap labor, succeeded in building up the second largest merchant marine in the world. Should the shipping board purchase their ships abroad, in order to secure the advantage of cheaper vessels, under the act of August, 1914, obviously no construction work will be afforded to American yards.

On the other hand, should they cause these ships to be constructed at home, they will voluntarily assume the handicap removed by the legislation of August, 1914, thereby increasing the losses attendant upon the proposed enterprise, and enlarging the inevitable consequent demands on the Public Treasury. Again while the claim is frequently made for this bill, that it is an emergency measure, the chairman of the Committee on Merchant Marine insists that it should not be so called.

Another contention stoutly made in certain quarters, with a view to enlisting the support of the uninformed through an appeal to their prejudices, is that this bill is a movement against monopoly in the carrying trade, and an attack upon an alleged shipping trust. If the proponents of this measure are tilting against monopoly in deadly earnest, if they really wish to serve the public by attacking a real trust, why not agree to admit the Government ships to the coastwise trade, and before sending tramp ships to the uttermost seas, demonstrate the feasibility of this scheme before our very eyes, by a reduction of domestic rates? Yet every motion looking to the admission of the Government ships into the coastwise trade, has been overwhelmingly defeated. It has been fully proved, so far as such a fact can be established, that over 90 per cent of the regular coastwise lines, are allied through interlocking directorates, with certain powerful moneyed interests. Why not admit the Government ships to this field, and permit them to ravage and destroy in this arena of private monopoly, until not a vestige of a domestic trust remains, and the people are entirely relieved from the thraldom and oppression of these monsters of horrid mien? As a matter of fact, an enormous amount of ocean-going traffic is carried by tramp steamers, which not only do not, but can not effect any working agreement or understanding, and while it is true that a number of established lines operating in various quarters of the globe, and handling the traffic of this, and other countries, operate under an understanding with each other, it has never been suggested that the Government of the United States should acquire and operate sufficient ships to compete with these lines, and seek to effect a reduction in their rates.

It would take many ships, and many sailings, to make the slightest impression upon the present aggregate of ocean-going vessels. Should the Government undertake this enterprise, the mind is staggered with the contemplation of the hundreds of millions of dollars that will be required to finance the project. Moreover, until the Government ships can furnish a service as good, and rates as low, or lower than their competitors, not a pound of exports, much less of imports, will be carried in these vessels. That an attack upon the rates of the trans-Atlantic lines that handle both passengers and freight, (and if there is a trust, these are the offenders), is not meditated in sober earnest, is revealed by the amount of the appropriation carried in the bill. Should this appropriation be expended upon the ordinary cargo-carrying type of vessel, these ships would not come in competition with the lines mentioned. On the other hand, if it is expended upon such vessels as are now being constructed for the great trans-Atlantic steamship lines, the Cunard Co., the White Star Line and others, the amount appropriated would not secure a baker's dozen of such ships, an attacking force that if directed against the hosts of monopoly, would provoke derision.

Both the Senate and the House committees might very profitably have taken testimony to support the claims respectively advanced in their reports. Again if the Government ships are to retire in favor of private capital, when the carriage on the lines served by them has become sufficiently profitable to attract and engage abundant capital, it may well be asked, what extent of profits will attract this capital? If the alleged net profits of from 30, to 40 per cent have not tempted American capitalists to take a mercantile venture under the flag of the United States, what amount of profits will tempt them? In this connection, and as touching on the question of profits in the ocean carrying trade, I will insert a quotation from a report of the Commissioner of Navigation:

> The profits of the ocean transportation business, as a rule, are moderate, the competition keen, and the risks considerable.

This scheme of a Government-owned, and Government-operated merchant marine is a new venture on an unknown and uncharted sea. There are no precedents to be consulted, no signposts to point the way. It is a dash into the unknown. Once entered upon, it will constitute a distinct movement toward general Government ownership, and operation, and cause a multiplicity of demands upon the Government to take over, and operate in the public interests, a variety of industries of a public service character. Some of these ventures have been pointed out, and if we are to engraft Government ownership upon our familiar and well-established Democratic principles, there is not one of them that is not preferable to this flier in ocean transportation. Undoubtedly the present interruptions in our commerce, the partial impediments in our trade routes, the decline of prices, and of orders, the stagnation in certain industries, and the general disturbance due to the disorders attendant upon a gigantic war, are responsible for much loose thinking upon this subject. An individual conducting, or interested in an industry injuriously affected by abnormal conditions, is easily led to the support of any project which he fondly hopes will afford some immediate relief. It is hardly necessary to say that in this instance these hopes will be blasted, and the effect of this bill upon our general trade, or the interests most seriously depressed by the present world-wide disturbances, will be entirely negligible.

From the best figures available, the cost of a steel cargo ship of 10,000 tons, gross tonnage, would be about $750,000 in the American yards, but put it at $700,000. The same ship in England would cost approximately $500,000. Upon this basis, for the purposes of comparison, the expenditure of $40,000,000 carried in the bill, would secure 57 ships in America, and 80 ships in England, according to prices prevailing in both countries before the war. Should the vessels be constructed in American yards, the loss incident to an expenditure of $40,000,000, would be $11,500,000. The purpose of the act of August 18, 1914, was to open the sea to American capital, by affording the opportunity to this capital to secure cheap ships. Yet the Senate report states that this bill will create work for our shipyards in the construction of ships. Is it a part of this scheme, for the Government to buy dear ships? If it is, then this measure, if not a subsidy to American ships, certainly carries a prodigious subsidy for American shipyards. If on the other hand, the Government proposes to buy its ships abroad, then the alluring reference of the Senate report to construction in American yards, is merely words of promise intended for the ear. They will be broken to the hope.

There are to-day interned in American ports 55 German and 11 Austrian ships, or 66 in all. Many of these vessels are great passenger liners by no means suitable for use as ordinary cargo carriers. These vessels may therefore be excluded from contemplation. The remaining ships after some overhauling could doubtless be used for bulk freights. But even if purchased, the effort to use them would lead to undesirable complications with the belligerent powers, so that the war would probably be ended, before these controversies were settled, and the ships put to the use for which they were purchased. Hence a purchase in this quarter would not afford even partial present relief.

The relatively insignificant number of freighters that the present appropriation in this bill will serve to provide, would be a scant supply for the South American lines referred to by the President. Even should their initial service be in the

waters of the North Atlantic, including the dangerous area of the North Sea, they would not afford the results so longingly desired in certain interested, and suffering sections of our country. The genesis of this idea of Government ships is found in the contention often advanced, that vessels are needed to enable the United States to capture the trade of South America. There is no subject upon which there is more misapprehension than this subject of South American trade, and while I believe that an opportunity has existed for many years, and exists now in greater measure than ever before, to extend our trade in that continent, yet the extent of our possible achievements in that direction have been greatly exaggerated. Nor is the acquisition of that trade dependent upon Government ships. What is primarily needed, are cheaper goods, better-packed goods, and longer credits. Our exporters will not displace the established trade of their competitors, until they are prepared to meet these essential requirements.

In the matter of transportation to South America, we are better supplied with American bottoms, than for trade with any other quarter of the globe. To-day there are registered for foreign trade in the United States 868 steam vessels, the great bulk of which are for traffic with South America, the West Indies, and Central America. In an address recently made before the New Orleans Association of Commerce by Fairfax Harrison, president of the Southern Railway Co., I find the following statement:

> There has been ample shipping facilities for all of the trade between the United States, and Central and South America.

Three weeks ago one of the officers of French, Edye & Co., explained that no barrier remained in the way of freight business between the United States, and South America, so far as the steamships were concerned. All we need, he added, is for the American manufacturers to increase the sale of their goods. When we get the freight, we can supply the bottoms to carry it. At that very time 40 steamers were expected in New York from South America. Hence the fallacy of the argument that our failure to secure a larger proportion of the trade of those countries, has been due to a lack of transportation. Much of that trade has been and will continue to be, in agricultural products that would not be taken by this country. The insistent suggestion is made that we must operate Government ships, in order to occupy the void left by the withdrawal of German ships from, and the cessation of German activities in, the continent of South America. But other nations are better prepared to secure that trade than the United States, by reason of their established connections, knowledge of the people to be served, and cheaper goods. These nations are already on the ground, and whatever we may do, they will capture a large proportion of the orders that formerly went to Germany. The countries of Italy, Spain, Holland, Sweden and Norway, are as well able as ever to maintain and extend their trade in that continent. While it is true that England and France are engaged in war, they have not abandoned their commercial activities in any direction, much less in South America, where the enforced retirement of their enemy has offered opportunities to them, as well as to this country. The possibilities in South America, for this country have been greatly exaggerated, and in no wise justify the immediate establishment of a Government marine. There is no El Dorado for the United States in the trade of that continent, and while in time we will no doubt profitably extend our connections in that quarter, the results will not be dazzling. Success will depend upon agencies, and activities other than Government ships. The crying need at this time, is an extension of our banking facilities in South America.

Criticism directed against American capital by the advocates of this preposterous scheme, creates an erroneous impression both as to the ability and the disposition of this capital to establish a privately owned marine, such as is found in every other maritime nation in the world. American capital has failed to enter this field for the simple, oft-repeated, and obvious reason, that our domestic legislation has rendered the conditions of entry impossible. Now that these conditions of inequality have in large part been removed, and before the opportunity even is afforded to ascertain whether private capital is willing or able, to meet foreign competition under the new conditions, this measure of discouragement and antagonism to private ownership is put forward with a comment that in itself is an unjust criticism, that as "private enterprise has failed to respond to the demands of our over-sea commerce, how much longer shall we wait on it."

It ill becomes the spokesmen of a Government which has destroyed private enterprise by the character of its legislation, to criticize the victims of its own blundering, or to seek to justify a venture of this unusual and anomalous character, without precedent in the shipping world, on the ground that private capital has failed to occupy a field that has been carefully locked and barred against it. As well criticize the State banks of issue for not continuing in business, after the imposition of the Federal tax of 10 per cent. I have said that this venture is without precedent in the commercial world. I am mistaken. There are two precedents. For some years the government of western Australia operated a small coastwise steamship line. In the first year the losses were $114,000, in the second, $96,000. The enterprise has been abandoned. The United States has operated a few ships in connection with the construction of the Panama Canal. This construction afforded a steady volume of traffic. The reports show a small profit, disregarding insurance, depreciation, and interest, imperative considerations in a private enterprise. Take these elements into consideration, and the small profit on the operation of these vessels will become a deficit. We have not waited on private enterprise a moment, and even now, in spite of the declaration that accompanies this bill that "it is better, whenever it is practicable, for the Government to avoid engaging in any business that can be conducted as a private enterprise," no opportunity is to be afforded to determine whether it is practicable for the Government to avoid engaging in this particular enterprise. Good faith requires that the opportunity at least should be afforded to private capital to essay the task under tolerable, if not equal conditions, before reaching the conclusion that the task is beyond its capacity. This much, I contend, would be becoming, in view of the depreciation of Government ownership advanced by all the advocates of this scheme.

Another reason why we should not be hurried into hasty action in this matter, is that as soon as this war is over, the merchant ships of all the warring countries will be hungry for cargoes on almost any terms. Inasmuch as our Government ships will have to underbid them, in order to secure any portion of the carrying trade, we will be confronted with a competition that will of necessity increase the losses that will attend the operation of this enterprise under the most favorable circumstances. It is estimated that the closing of the war will liberate probably 5,000,000 tons of shipping, "for ordinary over-sea freighting, which will result in an immediate drop in rates to the basis, if not much lower, of the rates prevailing before the war."

I am entirely satisfied that whatever temporary shortage of ships may have existed at any ports of this country, has been due to other causes than a shortage in the general supply of ships. The Boston Maritime Association has stated within the last few weeks, that repeated offers of sail tonnage for coal to South America, at equitable rates, have had no results, and that four steel ships were tied up in Boston for which no paying business could be obtained. In addition, the association furnished the Secretary of Commerce, "a list of Boston-owned tonnage representing over 200,000 tons dead-weight capacity, which could be chartered foreign, if rates could be obtained that would pay for round."

It is certainly a little singular that if the present rates are unreasonably high, due to a shortage in ships, and that foreign shipowners are reaping rich harvests of profits, no portion of the above tonnage can secure paying business; nor is any explanation offered why the vessels now engaged in coastwise traffic, and available for ocean transportation, do not qualify at once for this trade, and reap the rich harvest supposed to attend its prosecution under existing conditions. Doubtless they prefer moderate risks and moderate rates to greater profits and greater dangers. It is particularly strange that if the rates on cotton to Bremen are so exorbitant, that Government ships must be provided to furnish transportation at reasonable rates, the four steel ships now idle at Boston, do not betake themselves to Galveston, or to other ports, in order to secure the cargoes and reap the rich profits on those cargoes represented by the alleged unreasonable rates. One sufficient reason why this rush to Bremen has not taken place, may be found in the fact that if the rates are high, the risks are high, and high risks compel high rates. Within the last few days two American ships, the *Carib* and the *Evelyn*, respectively loaded with cotton for Bremen, have been sunk with some loss of life by floating mines in the North Sea. As a result of the losses occasioned by these accidents, our Government has been compelled to advance its rates for war-risk insurance, thus showing that public instrumentalities as well as private concerns, act alike when confronted with abnormal conditions. Greater risks and greater rates go hand in hand. No owner of a private vessel will expose his ship to unusual dangers unless reasonably indemnified against loss, and reasonable indemnity against loss in the war zone, and mined areas, necessitates enormous rates on the cargo carried. Would the Government vessels be expected to be more reckless in re-

spect to risks, than private ships? Is this assumption a part of this scheme?

The following citations from the statement of the Boston Maritime Association are of peculiar value in this connection, and rest in my judgment upon solid ground of fact:

> The apparent inability of shippers to secure tonnage is due rather to inability on their part to obtain marine insurance on cargoes, and on the part of owners to properly cover insurance on their vessels, coupled with their refusal to send tonnage to mined, and dangerous territory.
>
> The large amount of American sail tonnage suitable for foreign trade, can not now be considered, as shippers refuse to consider them for charter at present.
>
> The absence of return cargoes, except in a few favored trades, tends to increase outward rates, as any ships required to return in ballast, must of necessity require a higher rate outward, to cover a profitless return trip.
>
> Extraordinary high rates do not exist, except to ports within the mined districts, or to German ports, for noncontraband cargo, tonnage so destined, being in great danger of total loss.

That this danger is very real, and sufficient to justify extremely high rates is shown by the fact that over fifty neutral vessels have been lost within the war zone, since the breaking out of hostilities. Among these vessels were several ships carrying cotton to Germany.

The belligerent right of search is well understood in theory. On the other hand in practice, however prudently the right may be exercised, it provokes heat, irritation, misunderstanding, and angry discussion that frequently brings otherwise friendly nations to the verge of war. Note the violent protests already submitted by interested shipowners and shipmasters, against the alleged improper exercise of this right by the belligerent nations engaged in the present contest.

The profits in contraband materials offer a great temptation to ship them to a blockaded country. Looking to the figures and the character of exports from this country during the last few months, one can easily read between the lines, and see that a great amount of contraband material has been forwarded from the United States to the neutral nations of Europe. In the effort to stop this traffic by the exercise of the belligerent right of search, the nations at war touch the pocket nerve of the shippers. When this is done, violent contortions, and loud outcries invariably ensue. "The embarrassment to the dignity of the United States, of having a ship owned by the Government held up, searched, convoyed into port, and tried, on any one of many questions that might arise, is apparent." The exercise of the right of search by the belligerent powers invariably provokes controversy with neutral nations, and begets international correspondence. Such a correspondence is in progress at the present time between this country, and Great Britain. Government ships conveying cargoes to countries at war, that is Government merchant ships operated in commerce, would be liable to search, and detention, "in precisely the same degree, and on precisely the same terms," as privately owned neutral vessels.

Doubtless the shippers who are chafing under the exercise of this right of search by the belligerent powers, conceive that in some fashion a Government marine would provide ships that under conditions like the present, could prosecute their voyage without danger of interruption, search, or detention. But they are mistaken. Government ships would enjoy no such exemption. Moreover the use of these ships at such times, would increase the difficulties of a neutral nation. No nation can exercise its belligerent right of search and detention, no nation has ever exercised it, in a manner acceptable to the interests involved. These interests have invariably filed the most vigorous protests, and lodged the most grievous complaints with the authorities of their respective countries, insisting upon protection even to the extent of using armed force against the infliction of the alleged wrongs. The most difficult and troublesome complaints are thus presented at the most perilous times. Instant action is demanded, when above all things, action should be delayed to allow the heat of the contending parties to abate. At such times the Government should not be a directly interested party, as would be the case, if the ship seized, or detained, was a Government ship. "The business of ocean transportation, particularly in times of widespread war, involves certain hazards of an international and political character, with which the Government should keep itself absolutely free to deal, and in which all needless entanglement, and complication, is the gravest possible error."

This impartial attitude by the Government, or even a measurably impartial attitude, would be difficult of maintenance in a case in which a Government ship was seized, and taken before a foreign prize court for disposition. In such a case, particularly if any considerable portion of the public was already in an angry and inflamed state of mind, the action of the foreign Government would not in all likelihood be treated as the proper exercise of an accepted belligerent right, but as an attack upon the national sovereignty, an insult to our honor, and our flag. Under these circumstances, a flame of indignation starting in misapprehension could be easily kindled, and a state of public mind created, that would seriously embarrass a Government anxious to preserve its neutrality, but forced to unwise action by the pressure of an excited public opinion. Remember the *Maine*.

It has been noted that a Government ship pursuing the rôle of carrier, would be subject to precisely the same risks of capture and detention, as the ship of the private capitalist. In the event moreover that the Government ship is taken before a foreign prize court, the Government itself would become the aggrieved and injured party. "This would be a peculiarly delicate, difficult, embarrassing, and dangerous rôle for the Government to assume."

Why adopt a course which will render inevitable such a rôle? Why assume unnecessary risks? Why undertake to furnish ships under a policy that so far from allaying, would provoke trouble, would fail to meet the ends now sought by the victims of a present hysteria, and in other directions will afflict us with new responsibilities, and new burdens. There is no need for haste in this matter. We are not confronted with an emergency which can be solved by immediate action. Nothing that we can do at this time, will correct the abnormalities due to causes beyond our control. The pending bill presents the most radical innovation upon our traditional policies, the most unusual application of Federal authority, that has been presented since the Civil War. It commits us to an unknown and untried venture, unaided by the experience of other nations, and substantially, if not avowedly, socialistic. Falling prices, stagnating industries, commercial torpor, interrupted transportation, are grievous evils that invariably cause loose thinking, and are the fertile mothers of many extravagant and undigested plans for relief. The times demand sound thinking, and wise action.

No two advocates of this bill agree as to the fullness of its meaning, or the limitations on its scope. Is it, or is it not, an emergency measure? Is it, or is it not, a scheme of permanent Government ownership, and operation? Will it, or will it not, require successive annual appropriations to make effective its purpose, and if so, what approximately is the amount that in the ultimate is proposed to be taken from the Treasury to put this project finally and successfully on its feet? Is it, or is it not, to be run at a commercial profit? Are other lines in addition to the lines to South America, contemplated as a part of this scheme, and if so, are these lines like the South American lines, to be run at a loss, and to be turned over to private capital as soon as they begin to be profitable? Is Government ownership desirable, or undesirable? Who is qualified to state the working theory of this measure? All of these queries are differently answered by different champions of the bill. The President advances a theory of limited operation, in his message to Congress, coupled with an intimation that even this operation will be abandoned when the lines projected begin to pay. If this outline of operations fixes the scope of the project, then the expenditure in this direction would not be likely to exceed the amount carried in the bill. On the other hand the Secretary of the Treasury presents a far more ambitious policy of governmantal operation, one that involves transactions on the largest scale, calling for appropriations that in the aggregate may be fairly styled gigantic. At one time the proposition was put forward as an emergency measure. Later it is presented as a permanent policy, one that will overthrow trusts and combinations on the high seas, and afford such a supply of merchant ships, at such moderate and steady rates, as the shipping world has never seen. The House report expressly speaks of the bill as emergency legislation, and deprecates Government ownership in any business that can be conducted as a private enterprise.

The Senate report apparently highly approves of Government ownership, and of a continuing policy of Government activities in this direction. One advocate insists that Government ships can be operated at a handsome profit, and maintains that the forty millions carried in the bill, should be regarded as an investment of the first class, disregarding the fact that under the old conditions, the impossibility of making a profit on the money invested drove American capital from the use of the American flag. If profit is possible under the new conditions, ample private capital is available to occupy the field and Government ownership is not necessary. Another advocate admits that Government ships, operating at a greater labor cost than their competitors, will be unable to make a profit, but justifies their use on the ground that a losing venture in this direction should be supported by the Public Treasury, in consideration of the reduced rates to be afforded to the American shipper. The protagonists of this bill should agree among themselves, and pre-

sent in some consistent and coherent fashion the grounds on which they place this new departure in Government activities, affording at once the scope of its intended operations, its place whether temporary, or otherwise, in the policies of the Government, and a reasonable forecast of its probable cost. The Democrats at least, who support this measure, ought to be able to show not only that economically it is sound, but that it squares with our platform, and is related to some sufficient authority afforded by the Federal Constitution.

Mr. Speaker, in order to support this bill, I would have to reverse the attitude of a lifetime toward the fundamental principle of government ownership, I would have to reverse my attitude embodied in the adverse report which I made six months ago on the bill reported from the Committee on Merchant Marine and Fisheries, I would have to repudiate the declarations repeatedly made in my district prior to the election, that I intended to vote against this proposition, and oppose it in every proper way. I believe that it is plainly contrary to our platform, as I have sought to point out, and plainly contrary to the interests of the district which I have the honor to represent. No party will ever attain the full confidence of the people, no party will ever retain place and power, unless it rigidly keeps faith with the voters, and conforms its action to the declarations of intent and purpose contained in its platform. Upon that platform it must stand, as well as run. This is a particularly inauspicious time to try out new policies, involving large demands upon the Treasury. In every direction the pruning knife is being wielded in the most resolute, not to say reckless fashion. Particularly is this true in the Post Office Department, which is reducing salaries, and curtailing facilities in the most alarming fashion, upon the plea of economy. In pursuance of this policy, new rural routes which have been favorably reported, are being withheld from anxious petitioners, extensions of existing routes affording much needed facilities are being denied when they entail additional expense, and the intimation has been made that even existing daily rural service will, in many instances, be reduced to a tri-weekly service. The people of the country districts are far more interested in their local mail facilities, than in Government ships, and can not understand why economies should be effected in their domestic service, in order to furnish in part the millions needed for this ambitious scheme of Government ownership.

If the argument is put forward that these millions are needed to furnish facilities for transportation the retort may be made that transportation over the local roads is of far more immediate, and direct interest to the country generally, than Government ships. The farmer who plods his weary way through seas of mud, may be skeptical as to the advantage that he will derive from millions invested in ocean transportation, but he is in no doubt as to the advantage that will accrue to him, and the entire community of which he is a member, from improvement in his domestic highways. This is a work to which the Democratic Party is pledged by the declarations of its last two platforms, and if there is any money available anywhere, it should be appropriated in this direction. No possible sequel of trouble, no perplexing queries of constitutional authority, can be invoked against the redemption of this party pledge. These two great questions, roads, and mails, clamorously demand the attention of Congress, and require preferential consideration over the novel, and undemocratic policy of Government ownership. Apart from all the objections that may be urged on the political, constitutional, and economic side, to this pending measure, one last potent and efficient objection remains, and that is that once inaugurated, this policy of a Government-owned merchant marine, will absorb the funds required for the successful establishment and prosecution of many policies of intense interest to the rural communities, policies to which the Democratic Party is committed in the most irrevocable fashion.

Mr. Speaker, I will never support this undemocratic policy of Government ownership, until it is embodied in and made a part of our party platform. When President Wilson vetoed the immigration bill which had passed both branches of Congress by immense majorities, he made the following explanation of his action in his veto message: Does this bill rest upon the conscious and universal assent and desire of the American people? I doubt it. It is because I doubt it, that I make bold to dissent from it. I am willing to abide by the verdict, but not until it has been rendered. Let the platforms of parties speak out on this policy, and the people pronounce their wish. The matter is too fundamental to be settled otherwise. I only want instructions from those whose fortunes with ours, and all men's, are involved. Mr. Speaker, I renew the query of the President in the present connection, and ask: Does this Government-ownership bill rest upon the universal assent and desire of the American people? I sincerely doubt it, but am ready to abide by their verdict. For the present the people have not spoken, and until their verdict is rendered, I am constrained to stand on my party's platform, as it has been written. When I am instructed further, and otherwise, by the people of my district, I will conform to those instructions, and subordinate my personal opinion to the better judgment of the people, who constitute the fundamental authority in a free and popular government.

Some weeks ago a delegation representing cotton planting in the South, an industry which more than all others has been grievously afflicted by the present war, appeared before the President and asked his active interest in behalf of measures designed to secure relief for the interests concerned. He expressed the greatest sympathy with the planters, and avowed his readiness to lend his aid to whatever plans for relief sound thinking could afford. But he added that the problem must be solved with the head, not with the heart, and that nothing should be done which was economically unsound, or which would rise up hereafter to plague us. May I commend that thought in this connection?

An Analysis of the Election Returns of 1914.

EXTENSION OF REMARKS

OF

HON. JAMES W. GOOD,

OF IOWA,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, February 23, 1915.

Mr. GOOD. Mr. Speaker, under the leave granted to me to extend my remarks in the RECORD I include an article that appeared in the New York Times on February 21 entitled "An analysis of the election returns of 1914."

CONGRESSIONAL VOTE OF 1914 AND 1912 COMPARED.

To the Editor of the New York Times:

I beg to submit the following comparison of the congressional vote of 1914 with that of 1912. The vote for Congressmen only is considered. The figures include only the Republican, Democratic, and Progressive vote. The verdict on the Wilson administration, it seems to me, is to be found in this congressional vote, not in the vote which you chose and featured in a recent article in the Sunday Times, using figures for highest candidates in each State regardless of what office cast for. Prior to the publication of your table I had received the official State publications of many States giving the official count in those States. Your figures do not agree with them in every case, but the difference is slight. Where I have not had the official count I have used your figures.

WILSON WOULD HAVE LOST IN 1914.

Based on this congressional vote, Mr. Wilson would have been defeated. He would have received only 251 electoral votes, the Republican 280, and the Progressive none. In the North the Republican would have received 217 votes to his 45. In the West 52 to his 31. Compared with 1912 the Republicans gained 1,150,765 votes, the Democrats lost 379,978, and the Progressives lost 856,368.

REPUBLICAN GAINS.

The Republicans gained ground heavily in the North, West, and South; the Democrats and Progressives lost ground heavily in the North and South, but both gained slightly in the West. In 1912 there was no Progressive congressional vote in Kansas; last year it amounted to 74,401, which more than accounts for all the Progressive gain in the West. In addition to Kansas, the Progressives increased their congressional vote in California and Pennsylvania and a few thousand votes each in Nebraska, New Mexico, Vermont, Maine, and West Virginia. In the remaining 40 States they lost over a million votes.

The Republicans gained ground in 14 out of 16 Northern States, in 9 out of 15 Western States, and in 3 out of 17 Southern States. The Democrats gained ground in 5 Northern, 10 Western, and 2 Southern States; they lost ground in 10 Northern, 6 Western, and 15 Southern States.

PROTECTIVE TARIFF VOTE INCREASED.

The Republican and Progressive votes were for a protective tariff, such as was described in their respective platforms.

The protective tariff received a majority in the North of 1,012,401 in 1912 and the majority was increased to 1,263,638 in 1914, a majority of 393,262 in the West in 1912 increased to 619,950 in 1914, and a majority of 479,040 in the total United States in 1912, which was increased to 1,153,415 in 1914.

PROGRESSIVES RETURNING.

The Progressive split elected 77 Democratic and 18 Progressive Congressmen in 1912, without which the Republicans would have had a majority of 9 in the House. In 1914 it elected 40 Democratic and 6 Progressive Congressmen, without which the Republicans would have a majority of 45 in the next House. It elected 9 Democratic Senators in 1912 and 4 in 1914, without which the Republicans would have a majority of 10 in the next Senate.

This year the Democrats received 600,283 less votes and 80 less Congressmen than the Republicans in the North and 197,840 less votes and 5 less Congressmen than the Republicans in the West. When 13,343 additional Progressives out of the remaining 1,166,757 return to the Republican Party the total Republican Congressional vote in the United States will exceed the Democratic vote.

The following is a tabulation of the total congressional votes of 1912 and 1914:

Total congressional vote.

UNITED STATES.

Vote.	1914	1912	Gain.	Loss.
Republican	5,834,283	4,683,518	1,150,765	
Progressive	1,166,757	2,023,125		856,368
Total Republican and Progressive	7,001,040	6,706,643	294,397	
Democratic	5,847,625	6,227,603		379,978
Total in the United States	12,848,665	12,934,246		85,581
Democratic minority	1,153,415	479,040	674,375	

NORTHERN.

Republican	3,735,267	3,007,198	728,069	
Progressive	663,355	1,338,604		675,249
Total Republican and Progressive	4,398,622	4,345,802	52,820	
Democratic	3,134,984	3,333,401		198,417
Total in North	7,533,606	7,679,203		145,597
Democratic minority	1,263,638	1,012,401	251,237	

WESTERN.

Progressive	422,110	375,145	46,965	
Total Republican and Progressive	1,664,741	1,313,456	351,285	
Democratic	1,044,791	920,194	124,597	
Total in West	2,709,532	2,233,650	475,882	
Democratic minority	619,950	393,262	226,688	

SOUTHERN.

Republican	856,385	738,009	118,276	
Progressive	81,292	309,376		228,084
Total Republican and Progressive	937,677	1,047,385		109,708
Democratic	1,667,850	1,974,008		306,158
Total in South	2,605,527	3,021,393		415,866
Democratic majority	730,173	926,623		196,450

REPUBLICAN.

North	3,735,267	3,007,198	728,069	
West	1,242,631	938,311	304,320	
Total, North and West	4,997,898	3,945,509	1,032,389	
South	856,385	738,009	118,276	
Total Republican	5,834,283	4,683,518	1,150,765	
Total Republican gain, 1912 to 1914			1,150,765	

DEMOCRATIC.

North	3,134,984	3,333,401		198,417
West	1,044,791	920,194	124,597	
Total, North and West	4,179,775	4,253,595		73,820
South	1,667,850	1,974,008		306,158
Total Democratic	5,847,625	6,227,603		379,978
Total Democratic loss, 1912 to 1914				379,978

PROGRESSIVE.

North	663,355	1,338,604		675,249
West	422,110	375,145	46,965	
Total, North and West	1,085,465	1,713,749		628,284
South	81,292	309,376		228,084
Total Progressive	1,166,757	2,023,125		856,368
Total Progressive loss, 1912 to 1914				856,368

The Progressives received only 9 per cent of the total vote in the United States and as much as 15 per cent in only 1 State in the North, only 3 in the West, and only 1 in the South. In 36 out of the 48 States they received only 7 per cent or less.

In the North the Republicans got a clean majority in 10 out of 16 States, the Democrats in none. In the West the Republicans had a majority in 7 out of 15 States, the Democrats only in 3. It is only necessary for 25 per cent of the Progressives in 6 congressional districts in Kansas to return to the Republican Party to defeat 6 Democratic Congressmen, for 27 per cent to return in 3 Illinois districts to defeat 3 Democrats, for 29 per cent to return in 9 Indiana districts to defeat 9 Democrats, for 33 per cent in 2 Ohio districts to defeat 2 Democrats, and thus throw the House to the Republicans.

This only calls for the return to the Republican Party of 14,150 Progressives in Kansas, only 4,560 in Illinois, only 17,570 in Indiana, and only 1,595 in Ohio. These and more are already back. The only reason the Progressives cast 17 per cent of the total vote this year in Kansas, 13 per cent in Illinois, 13 per cent in Indiana, and 5 per cent in Ohio is that in each State were prominent Progressive leaders, who had not been candidates in 1912 and who therefore had to be shown how they stood with the people in 1914. They were shown, and now all Republicans, including the previous disgruntled ones, are ready to go ahead and repair the damage done.

DOUBTFUL DISTRICT.

The vote of the first congressional district of New York is tied up in court and is not included in above figures. On the face of the returns the Republican vote is 3 greater than the Democratic, and the Progressive vote is 1,275. If the Republican is declared elected it will add 1 to the Republican Congressmen. If the Democrat, it will add another Democrat to the list of those apparently elected by help of the Progressives.

HEAVY DEMOCRATIC LOSS.

The Republican vote increased more in the North than the Progressive vote decreased. As the Democratic vote decreased more than the difference, the Democrats probably contributed the difference. The Republicans gained 294,397 more votes in the whole country than the Progressives lost, and as the Democrats lost more than that many, that part of the Republican gain in the Nation was probably at the expense of the Democrats.

The Democrats not only did not capture any of the Progressive loss, but themselves lost almost half as much as did the Progressives. Since the Democrats failed to receive any of the first 50 per cent of the disintegrating Progressive Party, it stands to reason they will not get any of the last 50 per cent.

PROGRESSIVES DISAPPEARING.

The Progressives have practically disappeared in the South, and they lost exactly 50 per cent of their strength in the North. The same rate of loss during the next two years will bring them down to the size and importance of the Prohibition Party by 1916. While they apparently gained in the West it was not a real gain, for the reason previously stated. When the 1,085,465 persons who voted the Progressive ticket in the North and West in 1914 realize that they only elected Democrats thereby, and that the final effect was to shove up the 17 Southern States into control of themselves and the country, they will make short work of the trip back to the Republican Party, and probably most of them have made the trip already.

Below is a tabulation by parties and sections of the Congressmen elected in 1912 and 1914:

TOTAL CONGRESSMEN.

	1914	1912	Gain.	Loss.
Republicans	194	127	67	
Democrats	232	290		58
Progressives	7	18		11

EFFECT OF MINORITY RULE.

Southern Democrats, and some in the North, profess the belief that northern business men deliberately wreck their businesses to discredit Democratic administrations. An examination of the table, showing means of livelihood, will reveal the absurdity of this superstition by showing the real reason why business is harmed by Democratic administrations, and why, prior even to the war in this period, business was bad.

Our manufacturing industries and wage earners are located principally in the North. Fifty-three per cent of the total population, 75 per cent of the wage earners, and 66 per cent of the factories, in fact, are in that section. Now, it is a tremendous fact that 60 per cent of the congressional vote of the North was against Democratic policies in 1910, 1912, and 1914. When a 40 per cent minority is enabled to force an unacceptable industrial policy on a 60 per cent majority in an industrial community it ruins confidence there. If the minority theory is in truth wrong then it ruins business there. Business is injured and headed toward ruin when confidence goes.

The injury even starts when the 60 per cent majority lay down their dinner pails and begin throwing rocks at one another, for experience has shown that soon thereafter the 40 per cent minority will steal up on them, make off with everything, and pass laws that the majority is against. The minority never any more than gets around the corner with the booty to where its southern brother, always elected on the negro question, is always waiting for it, when the brother, although only half the size if measured by congressional votes, promptly takes everything away from it.

It would be bad enough if the 40 per cent minority located in the section doing the business wrote and passed the calamitous laws, but unfortunately when the Democrats win the South writes and passes the laws, and under the present administration executes them, in which case the section writing and passing the laws, being ignorant of economic conditions in the section legislated for, scatters the greatest possible amount of wreck and ruin about.

SOUTH CONTROLS BUSINESS.

The table shows how large is the majority of the people affected by tariff and industrial laws who live in the North and West (principally in the North), how overwhelmingly they voted against Democratic policies in 1912 and 1914, and how, thanks to the Progressive split, all power to legislate passed from them completely and went via the Democrats to the 17 Southern States. Thirty-two of the 34 chairmen of important committees of the House and 25 chairmen of the 35 important Senate committees are from the South in the Sixty-third Congress. It will be worse in the Sixty-fourth.

[1] President Wilson and Secretary McAdoo are counted as southern.

AN ILLUSTRATION.

A good illustration of what southern control means is furnished by the ship-purchase bill, intended to help southern cotton regardless of consequences. It came from the Commerce Committee of the Senate, and first had to be satisfactory to the 10 Democrats on that committee, 9 of whom are from the solid South.

Mr. Wilson's own vote in 1912, with its comparison with previous popular votes for President, is interesting and contains as little hope of Democratic success in 1916 as do the Congressional votes of 1912 and 1914. He received 6,293,120 votes. Against him were cast 8,714,680 votes. The popular vote has been taken at 22 presidential elections. At 12 the successful candidate received a majority, as follows: Jackson twice, Van Buren, Harrison, Pierce, Lincoln in 1864, Grant twice, McKinley twice, Roosevelt, and Taft. At 10 elections the successful candidate received less than a majority, as follows:

Polk, 27,433 less; Taylor, 151,706 less; Buchanan, 377,629 less; Lincoln (1860), 944,149 less; Hayes, 344,833 less; Garfield, 311,300 less; Cleveland (1884), 222,951 less; Harrison, 304,394 less; Cleveland (1892), 945,515 less; Wilson, 2,448,560 less.

POPULAR VOTE.

The popular majority against Mr. Wilson was over 1,500,000 votes greater than that against any other President in our history. He did not receive a majority of the vote in a single Northern or Western State and failed of a majority in 6 of the 17 Southern States. He received a majority in only the 11 States of the "solid South." In 35 of the remaining 37 he was elected by the Republican feud.

No President before him ever took the chair without having received a majority of the vote in a single Northern, Western, or border State. Of the Democrats, Buchanan had a majority in Pennsylvania, his home State, even if he did not get it in another Northern or Western State. Cleveland, in 1884, did not receive a majority in a single Northern or Western State, but he did get a majority in the States composing the northern tier of Southern States. In 1892, even, Cleveland had a majority in Connecticut and New Jersey, thereby stepping into the Presidency with the approval of at least 2 out of the 28 States of North and West.

Of the Republicans, Garfield had a majority in 18 out of a total of 22 Northern and Western States; Blaine in 16 out of 22; Harrison in 14 out of 22; McKinley, the first time, in 18 out of 29; McKinley, the second time, in 25 out of 29; Roosevelt in 29 out of 29; and Taft in 24 out of 29.

No Democratic presidential candidate from North or South in the last 60 years has received a majority of the total popular vote. The last Democrat to receive it was Franklin Pierce in 1852. Some of these Democratic candidates have made a poor showing, but none since the organization of the Democratic Party, with the single exception of Parker, ever made as poor a showing in the popular vote as did Mr. Wilson.

And the Nation has had little use at the next election for the Presidents who failed of this popular majority. Indeed, no minority President, with the single exception of Lincoln, has ever been reelected at the next election, and the Civil War conditions made his case different from all others. Two other minority Presidents were renominated for the next election, but both were defeated. They were Cleveland in 1888 and Harrison in 1892.

It is strange, yet true, that Andrew Jackson is the only southerner who ever received a majority of the popular vote. After Jackson, in 1832, and prior to Wilson, in 1912, a period of 80 years, we had elected only two southerners President—Polk and Taylor. Both were minority Presidents—the same as Mr. Wilson—and both were elected exactly as Mr. Wilson was—by a temporary split in the opposition in the North, the Liberty-Abolitionist split from the Whigs electing Polk, the Van Buren split and feud with Cass electing Taylor. But both of these southerners came two and a quarter million votes nearer a popular majority than Mr. Wilson did.

END OF THE FEUD.

Mr. Wilson's election and administration and the Democratic control of Congress are by-products of the Republican feud, and nothing more. Both will end when the feud ends. The record of the vote which I have set down above indicates that the election last November was the last in which the feud will be a factor. For both the 1912 and 1914 elections prove that Progressives can gain nothing for themselves with a ticket in 1916. If one is put up, it will be solely because it is the hidden purpose of Progressive leaders to continue southern control. When it requires deliberate intention to perpetuate southern control to cause the casting of a Progressive ballot, as will be the case in 1916, then the rank and file will not cast them. In 1912 and 1914 it was different. Then the Progressives were blinded to the discouraging truth by the vain hope of Progressive victory. Now, when it has come to a deliberate vote for the 32 southern chairmen of House committees and for Mr. Wilson, the remnant of the Progressive Party will be found doing the opposite thing.

REPUBLICAN VICTORY IN 1916 PREDICTED.

The Democratic congressional vote in 1912 was only 1 per cent less than Mr. Wilson's. This year it declined to 7 per cent less. The Republican-Progressive congressional vote in 1912 was 12 per cent less than Mr. Taft's and Mr. Roosevelt's. This year it advanced until the difference is only 8 per cent. These are normal off-year differences. This 1914 congressional vote points to a Democratic presidential vote not in excess of 6,500,000 and a Republican vote of over 7,500,000 in 1916 if there is no Progressive ticket in the field. If there is a Progressive ticket, it will not reduce the Republican vote below 7,000,000.

And thus this rebellious movement will pass into history. It has been absolutely true to type. Its effect was to give the South temporary control, precisely as did its predecessors, the Liberal Republican, Greenback, Mugwump, and Populist movements. Realization of that fact and of the impossibility of Progressive Party victory are dissipating it into thin air exactly as they were dissipated. This, it seems to me, is what the November election indicates with its Republican gain of 1,150,765 votes, its Progressive loss of 856,368 votes, and its Democratic loss of 379,978 votes.

F. C. TAYLOR.

ST. LOUIS, MO., *February 8, 1915.*

Maps of the Arctic Regions.

EXTENSION OF REMARKS

OF

HON. HENRY T. HELGESEN.

OF NORTH DAKOTA,

IN THE HOUSE OF REPRESENTATIVES,

Thursday, February 25, 1915.

Mr. HELGESEN. Mr. Speaker, I wish to make some observations in regard to the following House joint resolution, which I have just introduced, being a resolution to correct certain maps issued by the United States Navy Department—Hydrographic Office:

Whereas the maps of the Arctic regions issued by the United States Navy Department erroneously show waterways that do not exist and lands that are really deep sea, while lands that do exist are omitted altogether; and

Whereas such false chartings on the United States maps, especially those numbered 2142 and 2560, issued by the Hydrographic Office, are a menace to navigation and exploration and should not be distributed; and

Whereas the taxpayers of this country should not be compelled to pay for maps with erroneous chartings; and

Whereas these maps issued by the Navy Department are the authority on which the geography of the Arctic regions is taught in our schools, as they bear the official stamp of the Government: Therefore be it

Resolved, etc., That the Secretary of the Navy report to Congress the reason why the distribution of these erroneous maps is not discontinued and why corrected maps of the Arctic regions are not issued by the Navy Department.

The report of the nonexistence of Crocker Land sent back to civilization by the members of an expedition outfitted for the express purpose of exploring that land has aroused considerable interest in the subject of Arctic geography. This

alleged Crocker Land was the reputed discovery of Civil Engineer Robert E. Peary, who claimed to have first seen it in 1906.

In view of the inconsiderate disappearance of this mythical land, a brief consideration of Mr. Peary's various discoveries may prove both interesting and timely.

The Navy Department (Hydrographic Office) publishes two large maps, Nos. 2142 and 2560, which contain false statements; i. e., they chart waterways where none exist and lands where only sea is found. These maps are issued to mariners of all nations; they are also the authority upon which geography is taught in our schools throughout the land, as they bear the official stamp of the Government; therefore they should be corrected.

The erroneous charting complained of is due to the reports made by Engineer Robert E. Peary, who has reported to his own credit the following alleged "discoveries" as the results of his various Arctic expeditions:

1. The discovery of Peary Channel, a cross-country waterway dividing the extreme northern portion of Greenland.
2. The discovery of East Greenland Sea, a supposed sea northeast of Greenland.
3. The establishment of the insularity of Greenland.
4. The discovery of Jesup Land.
5. The discovery of Crocker Land.
6. The discovery of the North Pole.

Let us analyze briefly these alleged discoveries, the subjects of which Mr. Peary has caused to be placed on the maps of the Arctic regions.

1. The Peary Channel: This "channel" Mr. Peary describes at length in his book, Northward Over the Great Ice, and shows it on all of the maps used in his own books. The "channel" has been named in honor of Mr. Peary as its discoverer. (See maps Nos. 2142 and 2560 referred to above.)

The Danish explorer, Ejnar Mikkelsen, in his book, Lost in the Arctic, published in New York in 1913, which is an English translation of the official report of the Government expedition of Denmark, quotes the following report, signed by L. Mylius Erichsen, leader of Denmark's expedition to the northeast coast of Greenland, 1906–1908:

> We drove westward with 23 dogs until the 1st of June (1907), reaching Peary's Cape Glacier, and discovered that the Peary Channel does not exist, Navy Cliff being connected by land with Hellprin Land. We rechristened Independence Bay, calling it Independence Fiord.

The above report was confirmed by Mikkelsen (pp. 192–193 of Lost in the Arctic), Brönlund, and Høeg Hagen, and is also verified by Knud Rasmussen. Three independent expeditions have established the fact beyond dispute that Peary Channel does not exist. Why does the Navy Department issue maps with false statements thereon? Why must taxpayers pay for falsely plotted maps?

2. East Greenland Sea: Erichsen's expedition established the existence—verified by the expeditions of Rasmussen and Mikkelsen—of land occupying the longitudinal space from the point called "Academy Glacier" at 34° west longitude eastward to 12° west longitude, which space Peary had mapped as "East Greenland Sea." The various portions of this land Erichsen's expedition has christened "Kronprinz's Christians Land," "Erik S. Henius Land," and so forth. Therefore East Greenland Sea can no longer stand to Mr. Peary's credit, since it does not exist. Yet this East Greenland Sea is shown on all of Peary's maps. (See his book Nearest the Pole.)

3. The establishment of the insularity of Greenland: As Mr. Peary did not explore the extreme northeastern portion of Greenland, as is proven by the fact that he stated a sea existed where is only high land, and that the waters of a broad channel flowed where is also dry land, he must leave the honor of proving the insularity of Greenland to the later and more thorough Danish explorers, Erichsen, Mikkelsen, Rasmussen, and the members of their expeditions. The reports of these expeditions have been officially accepted and published by the Danes, and are accepted throughout the world by explorers, scientists, and geographers.

4. The discovery of "Jesup Land," as shown on Navy map No. 2142: Clark Brown, of Albany, N. Y., a member of the National Geographic Society, associate member of the American Society of Civil Engineers, a man of high standing in Mr. Peary's own profession, in a report made in 1913, says:

> In his book, Nearest the Pole, published in 1907, Peary describes the discovery of what he called "Jesup Land."
>
> This is the same land which the famous explorer Sverdrup called "Axel Heiberg Land," in 1900. (See Sverdrup's report.)
>
> Now, the significant part of this is that Peary's account of the discovery was not published in book form until 1907, and, most significant of all, on the map he prepared for the United States Navy in 1903 Peary placed this land many miles to the eastward of its afterwards discovered true position.
>
> Again, in telling of the expedition he made in 1906, Peary described the northern end of Heiberg Land, or "Jesup Land," as he called it, to the west of the extreme end of Grant Land, when it is actually almost directly south.

Therefore, the fact is patent that Mr. Peary only remembered that he had discovered and named "Jesup Land," after its discovery and christening by Capt. Otto Sverdrup had been made public. By some strange oversight Mr. Peary had neglected to announce this discovery until he saw another explorer obtaining the honor of priority; then his memory was quickened and he was able to recall the fact that he "saw" the land earlier than did Sverdrup.

5. The discovery of "Crocker Land": The fact that this land, "discovered" by Mr. Peary in 1906, has slipped its moorings and sailed for parts unknown is still fresh in the public mind. The Washington Post of November 25, 1914, carried the following news item:

> PEARY'S LAND IS GONE—MCMILLAN EXPEDITION FINDS NONE WHERE ADMIRAL SAW IT—NEWS TO AMERICAN MUSEUM—RASMUSSEN RELAYS REPORT, WHICH SAYS EXPLORERS SAW ONLY MIRAGE WHERE CROCKER LAND WAS LOCATED—TELL OF THRILLING TRIP—PEARY AWAITS FULL DETAILS BEFORE HE TALKS.
>
> NEW YORK, *November 24.*
>
> The Crocker Land expedition has established that there is no land at the point where Rear Admiral Robert E. Peary said Crocker Land was. The expedition after its long trip of 1,200 miles from Etah to reach the great unexplored continent supposed to exist in the north polar regions made its final dash of 125 miles over the ice from Cape Thomas Hubbard only to find that Crocker Land, if Admiral Peary located it rightly, has either melted or moved from its former position.
>
> MUSEUM GETS THE REPORT.
>
> The news that the land failed to show itself 130 miles from Cape Thomas Hubbard, in longitude 100° west and latitude 83° north, where Admiral Peary sighted it eight years ago was received to-day by the American Museum of Natural History. This information was relayed to Edmund Otis Hovey, one of the committee in charge of the expedition, through the courtesy of Knud Rasmussen, the Danish explorer. Mr. Hovey made this statement to-day:
>
> "Donald B. McMillan, leader of the Crocker Land expedition, accompanied by Ensign Fitzhugh Green, journeyed across the ice of the Polar Sea in search of Crocker Land, whose mountainous heights Admiral Peary thought that he described from an elevation of 1,400 feet on Cape Thomas Hubbard in 1906.
>
> EXPLORERS SAW A MIRAGE.
>
> "For two days Messrs. McMillan and Green thought that they saw the land, but this proved to be a mirage, and they finally concluded that Crocker Land does not exist, at least within the range originally ascribed to it.
>
> "The journey out and back from Cape Thomas Hubbard occupied two months and proved to be extremely perilous. The party crossed 38 leads on thin ice, lost most of their dogs on the journey, and on the day after they got back to Cape Thomas Hubbard, in the middle of May, the ice on the Polar Sea broke up and became a hideous, grinding chaos of broken ice, on which they would certainly have perished had they not got back as they did."

I also quote an editorial from the Washington Post of November 26, 1914, entitled:

> IS THERE A NORTH POLE?
>
> Now come Donald B. McMillan, leader of the Crocker Land expedition, and his associate, Ensign Fitzhugh Green, and state that after two months' search they have been unable to find the land named by Admiral Peary for the "angel" of the famous expedition which resulted in the alleged discovery of the alleged North Pole. There is no Crocker Land. The vast continent, whose cyclopean mountains lifted their shoulders into the arctic sky above purple snows and illimitable fields of thick-ribbed ice, has disappeared like a dream.
>
> What a region it is, that intangible realm that stretches northward into nothingness and mere oblivion. A region of unearthly lights, of mysterious noises, of elusive natives, of treacherous waters, of never-never lands. Is it any wonder that travelers from that bourne bring contradictions and tales that stagger the imagination?
>
> Old "Doc" Cook became the butt of the universe because he could not prove that he had reached the pole. Yet some of the marvels he described have been verified by later explorers. And now doubt is cast upon the achievements of Peary because of the nonexistence of a vast polar continent which he saw with mortal eyes. Men will ask, "How does he know that he reached the boreal pole, if he did not know a continent when he saw it?" Nay, they will go further in their scoffing and say, "How do we know that there is a pole?" The evidence of the visit to the pole is the same evidence that established the existence of Crocker Land, and now Crocker Land has joined the insubstantial pageant of dreams.
>
> Explorers in all times have been subject to the rude skepticism of prosaic minds. Marco Polo was even called a liar, John Mandeville was a medieval "Doc" Cook, and Purchas's Pilgrims told impossible tales of the pleasure domes of Kubla Khan. Even in America the friars who saw the Seven Cities of Cibola were denounced as drawers of the long bow.
>
> It is too bad to go through all the hardship and danger of penetrating to the thrilling regions of the pole, only to have the most reliable evidences of the exploit whisk themselves out of sight and leave the explorer without visible means of support as to the truthfulness of his narrative. Such tricks and devices on the part of nature are enough to disgust all explorers and cause them to curse the pole and the circumpolar seas down to and including the jumping-off place.

If Mr. Peary had claimed to have only had a glimpse of "Crocker Land" from one place at one time he might be justified in ascribing the vision to a "mirage"; but it is beyond credence that even in the Arctic a man would see the same mirage at two different times from two widely separated points.

Mr. Peary's first mention of "Crocker Land" is on page 202 of his book, Nearest the Pole, when quoting from his diary of

June 24, 1906 (ch. 10, Westward Over the Glacial Fringe of Grant Land):

From the summit 2,000 feet above the sea level and of a more truly Alpine character than any that I have seen in northern Greenland or Grant Land, the view was more than interesting. * * * North stretched the well-known ragged surface of the polar pack, and northwest it was with a thrill that my glasses revealed the faint white summits of a distant land which my Eskimos claimed to have seen as we came along from the last camp.

On June 28, 1906, after four days of travel westward, he writes in his diary while at his camp at the northernmost point of (his) "Jesup Land":

The clear day greatly favored my work in taking a round of angles, and with the glasses I could make out apparently a little more distinctly the snow-clad summits of the distant land in the northwest, above the ice horizon.

My heart leaped the intervening miles of ice as I looked longingly at this land and in fancy I trod its shores and climbed its summits, even though I knew that that pleasure could only be for another in another season. (Page 207 of Nearest the Pole.)

The New York Times of November 26, 1914, also published the following:

Admiral Peary fixed the situation of Crocker Land at 100° west and 83° north by triangulation. His calculations were made possible by his two views of the supposed mountainous region from Cape Thomas Hubbard and Cape Colgate.

He made his observation from Cape Thomas Hubbard at a height of 1,400 or 1,500 feet. The land, which he believed he saw at a distance of 130 miles, must have been more than 2,000 feet above the sea level or the curvature of the earth would have sunk it below his horizon.

Under date of November 28, 1914, Mr. Clark Brown, associate member of the American Society of Civil Engineers, Albany, N. Y., wrote to Prof. E. O. Hovey, American Museum of Natural History, New York City, the following letter:

Prof. E. O. HOVEY.

DEAR SIR: The New York Tribune of November 25, 1914, contains the information that MacMillan has found that "Crocker Land" does not exist."

At the time that another of Peary's discoveries, "Peary Channel," was reported to be fictitious, I discussed the general reliability of Peary's reports in the Knickerbocker Press, May 8, 1913, using a map prepared by me in 1910 to illustrate some of my points.

I beg leave to file a copy of that article with you, and I invite thoughtful consideration for it at any time when Mr. Peary's so-called discoveries are before your societies.

Sincerely, yours,

CLARK BROWN.

Prof. Hovey acknowledged receipt of the above communication, stating that he had placed it on file.

Only one discovery remains to Mr. Peary's alleged credit, namely, the finding of the North Pole in 1909, where he claims to have made a sounding, which is shown on Navy map No. 2560.

When examined before the congressional committee relative to his alleged trip to the North Pole, Mr. Peary stated two facts of great interest, namely, that he took no observations whatever for longitude on his trip, that he took no observations for compass variation, and that he traveled by compass. He also stated that he did not have with him a chart showing the compass variations which have been computed by other expeditions and scientists. A most complete and accurate map of this description has been drafted by Mr. Clark Brown, of which he says:

This map, embracing most of the Arctic Ocean, shows what is known at the present of the magnetic needle in the Arctic regions antiguous to the North Pole. The latest available data was used in constructing this chain of observations. Older observations, one taken in the Smith Sound region in 1616 by Baffin and others taken in 1819–20 by Parry near the North Magnetic Pole, and some old ones in Bering Sea, were rejected. The observations taken on the ill-fated *Jeannette* expedition may be taken as the beginning of the chain, which is continued by the *Fram* expedition around the balance of the side toward the Eastern Hemisphere. The British expedition of Nares and the Canadian expedition of Bernier nearly complete the chain on the American side. A reading from the British Admiralty chart of 1907 for the mouth of Mackenzie River and another for Point Barrow completes the circuit.

The only observations reported by any of the Peary expeditions that can be definitely located upon a map are one taken from Astrup's survey of Melville Bay and one taken from Borup's book for the north point of Greenland. These are both used. I omitted all the observations of the Kane expedition and used the only one found for the ill-fated Hall expedition, because it was 20 years later. The great foot journeys of Nansen, Cagni, and Cook are each represented by an observation taken at the point farthest north reached by these capable and hardy explorers.

This circuit of observations shows some of the most remarkable changes in compass pointing that have thus far been found in the known world. A study of the map, however, convinces us that whoever in the future ventures to explore this region within this loop will find some such startling changes as those found by Bernier on one side of the loop or as shown by comparing Nansen's with Cagni's most northern observations on another side.

Peary says that he took no observations for compass variation upon this last trip. He has not told us how he and the trail makers of his expedition could tell from time to time which way was north.

If some future scientific inquiry into the polar question should uncover the method by which Peary was able to know which way was north without having first observed for the variation of the compass, a great and hitherto unsuspected aid to navigation will be found. Until such discovery has been made explorers will continue, as in the past, to observe compass variations when in the Arctic regions.

CLARK BROWN.

In report "Subcommittee No. 8 of the Committee on Naval Affairs," January 7, 1911, page 26, Mr. Peary stated that he made no observations for compass variation and had with him no chart showing such variations.

On January 11, 1911, before the same committee, page 94, Mr. Peary stated that on his polar trip "no longitude observations were attempted."

On page 87 of the same report Mr. Peary stated that he made a sounding of 1,500 fathoms at the pole, which sounding is recorded on Navy map No. 2560.

All mariners, explorers, and scientists agree that in traveling over an unknown region, with no visible landmarks, it is a physical impossibility to travel 500 miles, which Mr. Peary claims to have done from the last point of land to the pole, by compass without, as he himself stated, having taken any observations for compass variation. It must be conceded that by this statement Mr. Peary unqualifiedly admits that he could not have made the trip to the pole. Thus the figures of a sounding "at the pole" given on the Navy map are false, and should be removed from the map.

Mr. Peary has been quoted as saying that an explorer's achievements should be rated by his previous experience, his morality, his mental and physical ability.

Rated by this standard, which Mr. Peary has himself established, what is the natural and logical deduction relative to his various "discoveries"?

Granted that Mr. Peary has had many years of Arctic experience; granted, for the sake of argument, that his moral character may be above reproach; admitting that his mental faculties are keen, is it not a fact that an abnormal condition of physical sight which causes a man to behold an open sea where is really high land; to imagine a broad channel of swiftly flowing water which is actually land connecting two other portions of land; to discern the lofty pinnacles of an unexplored "continent" at two different times and from two different places, thus eliminating the "mirage" theory, which "continent" is now conclusively proved to be an unbroken expanse of Arctic pack ice; I repeat, must we not concede that a man who is unable to distinguish land from ice or swiftly flowing water from land is unquestionably in error in his supposition that he had stood at that point on the earth's surface where in every direction he looked south, when his mental condition was such as to lead him to the self-delusion that he could make a round trip of 1,000 miles by estimate alone over the Arctic ice without knowing in what direction his compass needle pointed?

Rural Credits.

EXTENSION OF REMARKS

OF

HON. J. CHARLES LINTHICUM,

OF MARYLAND,

IN THE HOUSE OF REPRESENTATIVES,

Friday, February 26, 1915.

Mr. LINTHICUM. Mr. Speaker, I note from the morning papers that the Senate has attached to the Agricultural supply measure an amendment providing for rural credits. I do not know how acceptable this amendment may be in its provisions for the farmer, but I do hope that it may be so thrashed out in conference between the two Houses that a creditable working measure may be brought forward that will enable the farmer to procure loans in order the better to conduct his business and increase the products from each and every acre of his farm.

The country is sorely in need of a farm-credit measure, and I hope that this amendment will provide the same at this session. It should enable the farmer, together with the provision in the measure for farm extension work, for which something over $1,000,000 has been authorized, to not only secure the necessary money to conduct his farm upon a business basis but through this extension work to increase the yield of his acres. Upon this subject, Mr. Speaker, I desire to express myself to the House to-day, because I am deeply interested in the farming industry of our land.

Those of us who have read Mark Twain's story of American boyhood, Huckleberry Finn, remember the incident in which that exuberant youngster shuffled the spoons on Aunt Sally. When first that good old lady counted them there were 10, but after Huckleberry Finn secreted one in his sleeve there were

only 9. Then he put back the stolen spoon; the old lady counted them again, and this time there were 10. And so she continued to count, first finding 9 and then 10, until so thoroughly puzzled did she become that she gave up in disgust, not knowing whether there were 9 or 10 spoons.

That is the case of our farmers to-day. They are perplexed by a situation, the controlling influences in which are beyond their grasp. Two things in that situation, however, are perfectly plain to them:

First. They are producing the food of the American people, that is being bought and paid for at prices that should make them well off.

Second. They are not receiving their fair share of what those products bring.

And naturally they ask, "What is the reason?"

TWO DISADVANTAGES.

Having been reared on a farm, and having kept in close touch with farming all my life, and being now engaged in farming on a limited scale, with that usual American characteristic I am not lacking in a personal opinion on that subject. And my opinion is that, considering farming as an economic proposition, the farmer now seriously suffers from two important disadvantages, namely:

(a) Lack of the best methods in farming; and

(b) Lack of adequate selling facilities through which he may dispose of his produce so that he personally receives the highest market value for his crops.

When we consider that through our farmers come five and one-half billions of dollars of new wealth each year we can readily understand the importance of their welfare to us. "Agriculture is the foundation of manufactures." The condition of all other industries is dependent upon the farm. A flourishing agriculture tells of a prosperous land.

It has been said, "Blessed be agriculture, if one does not have too much of it." This statement probably expresses the truth of the situation, for our farmers have always had too much hard work and been indifferently rewarded. Only within comparatively late years has our farming been conducted along the same strict business lines as other industries. Now a farmer with a large acreage who does not get out of it the most the land can be made to produce is worse off than the farmer with a small acreage. Those with more acreage than their annual yields justify are working under a handicap. They not only expend more labor and energy to secure their crops, but pay out more in taxes, fencing, and so forth. Farmers in Europe have been producing two and one-half to three times as much per acre as American farmers, notwithstanding that European farms have been under cultivation for many centuries and were probably not originally so fertile as ours. It is therefore evident that the success of the American farmer lays in the increase of his production per acre and the disposal of that production at the best market prices, after deducting a fair commission for its sale.

LACK OF SELLING FACILITIES.

In my opinion every State should interest itself in seeing that the crops of its farmers are sold at the best prices obtainable. It surely ought to recognize that the greater the return it can bring to its farmers, the greater the wealth of the State. Of what value are plentiful crops to our farming population if those crops can not be converted into cash? It seems to me quite apparent that the State should, through the proper officials, endeavor to forecast the size of its crops and then lend every energy to aid its farmers to dispose of them in those markets where they will bring the best prices.

You may call this paternalism if you wish, or socialism if you prefer, but whatever it is I am sure that it will stand the test of sound reasoning. I regard it as the highest duty of the State to promote the welfare of its citizens, and the assistance given any man which results in securing for him the best prices in the open market for the products of his labor not only deepens the obligation of that citizen to the State but further awakens a sense of his moral responsibility to make good.

We know that local bodies of farmers, the granges, cooperative societies, and organizations of similar character have been doing a valuable work in the interest of their members who grow certain products. But farmers with small crops of secondary products have suffered the lack of such an assistance because the quantity of products of which they were individually possessed did not warrant any permanent organization for their disposal. Here is where State aid would and should come in. Through our present inadequate marketing facilities nearly enough products are wasted on the farms around every big city to feed that city. Here is where a large slice of the dividends of some of our farmers go.

A State farm bureau, or some similar office, by representing a number of these small-crop owners, could aid in disposing of, at the best price, what are termed in the manufacturing industry "by-products." True, this would be the less important office of such a bureau, but I mention it first because there exists in most of our States at this time nothing of the kind to aid the farmer. The greatest value of such a bureau would be, of course, in finding for our farmers the most profitable markets for their main crops, directing attention to those markets, and aiding in getting the produce to them.

IMPORTANCE OF AVAILABLE MARKETS.

It will be seen from this brief outline the aid the State can render its agricultural population. It is important to the Nation that the State do its full duty in this respect, for if the National Government is to spend millions of dollars in encouraging increased production—larger crops—there is nothing that will more effectually neutralize its work than a condition under which, after the adoption of the most approved methods and the most laborious efforts of the farmer, he finds himself in possession of a crop that, owing to a similar abundance upon the part of his neighbors, it is impossible to sell.

There is a statement often heard, "There is a job for every man," and that the solution is merely bringing the man in touch with the job. If this be a fact, and I believe it to be approximately so, then it may be said with equal truth that "There is a market for every crop," and the problem is necessarily one of getting the crop in the particular market wanting it.

With the increased production we are stimulating this becomes a consideration of the utmost importance, for hereafter, when there is a surplus, that surplus will be greater than ever, and when there is a shortage that shortage will be more keenly felt than ever before. Our increasing population, the steady decrease in the area of our agricultural sections, the growing dependence of our city population upon our farms for the means of sustenance, are changes we can not ignore.

So imperceptible is the increase of our population that we rarely stop to think when we hear of the birth of a child that here is another mouth which must be fed, another body which must be clothed, another mind to be educated, and so on. But if we look ahead over a considerable period of time one experiences no difficulty in foreseeing conditions in the future. Upon a conservative and careful estimate, in less than 100 years we shall have a population in this country of 300,000,000 people—three times the present number. These people must be fed and clothed, and the clothes to keep them warm and the food to feed them must come from what we term the "agricultural sections" of our land.

In 1906 the United States exported 525,000 head of cattle and in 1912 only 105,000, a decline of 75 per cent. In 1906 we imported only 16,000 head of cattle, while in 1912 our imports reached 318,000, an increase of 2,000 per cent in six years.

Now this demand for food in increased quantities must be met. A colossal market for the products of agriculture is steadily opening, furnishing a demand for what our farms must be made to produce. And they can be made to supply those demands by exacting from every acre the maximum of what that acre will yield. Reliable figures show that the products of agriculture during the last 10 years decreased in seven instances and increased in only three. And, when they do not know, our farmers must be shown those methods which have been found to increase the products of the soil.

FARM-EXTENSION WORK.

Recognizing this situation, not unmindful of the vast problem of the future, this House passed the Lever agricultural extension act under which the several States in cooperation with the Federal Government propose to offer the latest and best knowledge in farming to our farmers throughout the Union.

I believe the benefits that will follow this instruction will promptly show themselves. The bank accounts of southern farmers who have profited through teaching along this line prove this. Under the provision of this law classes in farming instruction may be maintained as a part of every country school in the land of sufficient size and students will be turned out as well versed in a sound and practical knowledge of up-to-date farming as they are in their alphabet or in their multiplication tables. And this education of the young will be supplemented by carrying direct to the farms of those who desire it, a free knowledge of those methods that have been demonstrated to result in increased or better crops. This method of teaching makes classrooms of the field, the garden, the orchard, the parlor, and the kitchen.

In my opinion, this knowledge should be carried to our farmers by men of ripe experience and sound judgment, who have

been farmers themselves and made a success of it. They should be of the class and character of men who would beget respect and confidence. Were this work intrusted to youthful instructors, having but a limited experience in practical farming, I am afraid it would not be distinguished by that success which should attend it. But with the right men, I feel confident that this personal demonstration work of what can be done through the use of better methods will meet with cordial reception and result in many millions of additional dollars in profits to our farmers.

THE GOLDEN AGE OF AGRICULTURE.

What does this mean? This great forward stride in the progress of the farmer means the unlocking of the door of happiness and wealth to him. It announces the ushering in of the golden age in American agriculture. It will bring larger and better crops at a time when there is a wider market for those crops.

Taken in connection with the improved roads which are being put down generally throughout the country—and I am proud to say my State is one of the leaders in the good-road movement—it means that through the adoption of the automobile, which is coming into general use in our rural sections; through the facilities offered by the parcel post, the telephone, automobile busses, plying from town to town—surely to be followed by an automobile-truck express service, carrying the heavy loads which the parcel post can not handle—a complete readjustment of our rural life, and that the country will be freed from the most serious of those objectionable features which heretofore made it undesirable to many.

The flow of families from the country to the city will be checked, and boys and girls raised in the country will be content to remain there. It will mean even more than this. It foretells the use of many of our unemployed farm lands and the movement of a percentage of our city population back to the farm.

There is no nobler profession in all America than that of farming, and it requires as much brain as does any other occupation in life. Thousands of good men living in our cities work in cramped and unhealthy surroundings, their families crowded into teeming apartments or small houses in a row, where they are not in a desirable environment. Many of these men long for the pure air and open fields of the country and will follow the natural bent of their inclinations and return to the farm.

And it will not be to the old farm life of bygone days, with all its hardships, but to the modern farm, where the good housewife may possess her electric washer and churn, draw water from a spigot in her kitchen, enjoy the comforts of steam heat, hot water a plenty, and bathe in her own bathtub in her own home.

She will talk over the telephone with her neighbors near and far with as much enjoyment as she discussed matters across the lawn with her city acquaintances.

She will jump into the family automobile and drive to church 2 or 4 miles away in less time than it took her to walk 5 blocks to devotional services in the city.

If she wishes to shop in the town 15 or 20 miles distant, she will be able to do so in her automobile with almost the same ease and in less time than required when she lived in the city to take the car and go "down town."

This is what the new order of things has already made possible in the country, and people are beginning to awaken to a realization of it. Modern invention has banished from rural life nearly all the old terrors that were the bane of those who would not remain. It has made it possible for families to live in entire comfort in our rural sections without foregoing those physical comforts so highly prized, such as indoor lavatories, bathroom, electric lights, the communion with friends, the daily mail and daily papers, and the opportunity "to get to people when they want to." Many of these modern appurtenances have already been adopted and others are being as rapidly as the circumstances of our farming population permit.

CONTENTMENT ON THE MODERN FARM.

And these changes, to some of which I have referred, are responsible in a large degree for the spirit of contentment which is coming over the boys and girls and women on our farms. Possibly it was the old order of things that accounted for the fact that in 1880 there were 70.5 per cent of the population of the country classified as rural, while in 1910 only 53.7 per cent were classified as rural, embracing towns of 2,500 people or less. Excluding these small towns, only 36 per cent of our entire population actually live upon farms.

The position of the farmer's wife formerly, who bore most of the burdens and shared in few of the rewards, reminds me of the story of the dwarf and the giant told in the Vicar of Wakefield.

In that story, you will remember, a dwarf and a giant made a bargain that they would go seek adventures. In the first battle the dwarf lost an arm, while the giant escaped unharmed. In their second battle the dwarf lost an eye, but the giant put their foes to rout, and they rescued a maiden in distress. who, falling in love with the giant, married him. They now traveled on and came in conflict with a band of robbers, and in this adventure the dwarf lost a leg, although the giant was without a single wound, and again put their enemies to flight. Though the dwarf had lost an arm, a leg, and an eye, it was great fun for the giant, who, flushed with success, cried out to his small companion:

"My little hero, this is glorious sport; let us get one victory more, and then we shall have honor forever."

"No," cried the dwarf, who by this time was grown wiser; "no; I declare off; I'll fight no more, for I find in every battle that you get the honor and rewards, but all the blows fall upon me."

That was the fate of the farmer's wife. The man got most of the honors and rewards and she suffered the brunt of the hard knocks.

THE REAL LIFE.

I have great admiration for the American farmer, for he is the man who is to-day feeding the world. If it were not for his labor and energy, it is more than likely that the helpless women and children of the fighting nations of Europe would starve before their men folks settled their differences on the field of combat. Our farmers are an incomparable body of men, the best of the brain and bone and sinew of the land. At Lexington, Valley Forge, Yorktown, Lundy's Lane, Chapultepec, during our Civil War, and at Santiago they have shown, like Fabius of old, their ability to lay aside the plowshare and do heroic work for the glory and honor of our country. Most of our lawmakers were first crop makers, and the man who has not enjoyed such an experience has been deprived of one of the richest of life's blessings.

The man searching for as full measure of industrial independence as obtainable and looking to the welfare of his family will, under these changed and improved conditions, surely come back to the soil. It is the real life. Seeking relief from the thraldom of a joyless labor and the small tyrannies of petty bosses, he will find the most inviting haven in our rural life, and it will not be long before men will aspire to the freedom and blessings of such an existence as devoutly as many in the past longed for the day when they could "quit the farm."

It is such a contemplation that recalls those lines of Goldsmith in The Deserted Village.

How blest is he who crowns, in shades like these,
A youth of labor with an age of ease;
Who quits a world where strong temptations try,
And, since 'tis hard to combat, learns to fly!
For him no wretches, born to work and weep,
Explore the mine or tempt the dangerous deep;
No surly porter stands in guilty state,
To turn imploring famine from the gate;
But on he moves to meet his latter end,
Angels around befriending virtue's friend;
Sinks to the grave with unperceived decay;
While resignation gently slopes the way;
And, all his prospects brightening to the last,
His Heaven commences ere the world be past.

"From Newsboy to the Senate."

EXTENSION OF REMARKS

OF

HON. J. M. C. SMITH,

OF MICHIGAN,

IN THE HOUSE OF REPRESENTATIVES,

Thursday, February 25, 1915.

Mr. J. M. C. SMITH. Mr. Speaker, under the leave granted to extend my remarks in the RECORD, I wish to insert an article published in the Cosmopolitan for October by John Temple Graves, entitled "From newsboy to the Senate," illustrating the distinguished public career of the senior Senator from the State of Michigan, Hon. WILLIAM ALDEN SMITH:

FROM NEWSBOY TO THE SENATE.

[By John Temple Graves.]

During the sweltering July of 1911 the American Senate engaged in a very picturesque and spirited debate over the action of a Senator from Mississippi to retain on the roll of Senate employees Jim Jones, an old Confederate negro who had been the bodyguard of Jefferson Davis, had voluntarily gone to prison with the Confederate chieftain as his valet, and had been always loyal in war, loyal in peace, and stainless in character.

Not a sectional or partisan note stirred the debate, until a Senator from Idaho (not BORAH) objected to the proposition on the ground that it was seeming to indorse by indirection an "infamous cause."

Very eloquent comments followed from Southern Senators. In the very crisis of the debate the Senator from Michigan, who is the subject of this sketch, in a speech full of fine and generous eloquence, paid full and cordial tribute to the splendid, if mistaken, courage and conviction of the Confederate soldier, eulogized personal and public loyalty as the noblest of virtues, and so swept the Senate by his eloquent magnanimity that the old negro retained his place by an overwhelming majority.

And this incident fitly illustrates the manly, generous, and American spirit of the senior Senator from Michigan.

A newsboy and bootblack, with an inherited family of five to support, at 12 years of age, a cash boy at 13, a Western Union messenger at 14, a page in the Michigan Legislature at 15, a reporter for a Chicago daily at 19, a clerk in the national Republican convention at 21, a Congressman at 34, and at 46 an eminent Senator of the United States.

It would be difficult to find a career more wholesome and more thoroughly representative of this land of opportunity and of equality under republican institutions than that of WILLIAM ALDEN SMITH.

It is a long, high jump from the news stand to the American Senate, and it takes strong legs and a clear head and a resolute will to make it.

WILLIAM ALDEN SMITH has all of these things, and the years have demonstrated that he has something much more. He has noble ambitions, a definite purpose, tireless industry, high courage, and a great human heart.

It is out of his heart that there came the things that make WILLIAM ALDEN SMITH unusual among men. The fine, noble spirit within the man gives him his cordial grace of manenr, his swift sympathy with his fellow men, his generous partisanship, his magnanimous foemanship, and his catholic love of country.

He is personally known and personally loved by two-thirds of the entire population of Michigan. When he came to the Fifty-fourth Congress, he, a Republican, was elected from a Democratic district by a majority of 10,000 votes. When he ran for the last time in his district he was elected unanimously, without any votes against him anywhere. Good stuff in a man like that.

Of the blood of old Israel Putnam and the four Abercrombie brothers, minutemen of the Revolution, with a southern mother and a Michigan father, the heredity was perfect for public usefulness, and the grandson of Henry Alden, the Virginian, mingles the qualities of his forebears to the credit of his constituents.

A LOYAL FRIEND.

Deep in his loyal soul WILLIAM ALDEN SMITH, of Michigan, has held the humanities and the obligations under which he fought and won. He has never forgotten the men who labored with him and the men who rose with him. And for the fellows who did not rise WILLIAM ALDEN SMITH'S heart is just as warm and his hand is just as ready.

Because he won in the battle of life by hard labor and unfailing honesty, Senator SMITH has always been a hard worker and a Senator of sterling integrity. His diplomacy is, and it has always been, the diplomacy of directness and sincerity. There is never any doubt as to where he stands on any public question. He is absolutely fearless in the statement of his convictions, and neither party caucuses, nor Senate traditions, nor autocratic Chief Executives embarrass or intimidate the expression of his honest views.

And because this land of liberty and opportunity has prospered Senator SMITH out of stern struggles into fortune and repute, he loves this country and he respects it everywhere. He is no cringing American, no truckling Tory, apologetic in commerce, and apprehensive in war.

WHAT HE HAS DONE.

He is for the American policies, is the Senator from Michigan, and he makes his advocacy heard and felt. Upon the stalwart American issue of the exemption of American coastwise shipping from the Panama Canal tolls he took his stand promptly and resolutely against the surrender of American rights to England. In the Foreign Affairs Committee he fought vigorously against repeal, challenged all opposition, including the President's, with fearless frankness, and closed the debate for the American contention with one of the most masterly and convincing speeches of the entire session.

Senator SMITH was the first Republican in the Senate with courage to attack the undisputed and almost omnipotent sway of his Republican colleague, Senator Aldrich, and to force from the Aldrich emergency-currency bill the railroad-bond feature, of which he did not approve.

Both in House and Senate Senator SMITH was a champion of the direct election of Senators by the people, and to him more than to any other man his State of Michigan owes its excellent primary-election law.

Perhaps the most conspicuous recent service of the Michigan Senator was in the investigation of the *Titanic* disaster, over which he was selected by his colleagues of the Committee on Commerce to preside. The thoroughness and fidelity with which, without training in maritime and admiralty law, he discharged this great task were admirable evolutions of the same qualities which characterized his youth. He went straight to New York, went straight to the *Carpathia*, seeking personal interviews and information from the cabins of survivors and friends, went to the bottom of every question growing out of this greatest of all sea disasters, and presented a report which won the unstinted praise of English and American jurists and journalists, and will help in all time to increase the safeguards of passengers at sea.

The Michigan man is the second ranking Republican member of the Committee on Foreign Relations and the second ranking member of the Committee on Commerce and a member of the Committee on Naval Affairs, where he stands for a greater Navy and the full strengthening of the first line of our defense.

He was one of the men appointed to draft the declaration of war against Spain. He visited Cuba during the cruel régime of Weyler, and his denunciations of the "butcher's" cruelties did much to stir the American arms to action. He was the friend of William McKinley, who used SMITH'S pen in signing the declaration of war.

Senator SMITH is an orator of national fame, and is in frequent demand upon national and literary occasions. He is happily married. Mrs. Smith enjoys an enviable place in social and official life at Washington, and bears her own and her husband's honors with grace and dignity. They have one son of 21 years, who carries his father's name with high promise of future success.

The Shipping Bill.

EXTENSION OF REMARKS

OF

HON. JOSHUA W. ALEXANDER,

OF MISSOURI,

IN THE HOUSE OF REPRESENTATIVES,

Friday, February 26, 1915.

Mr. ALEXANDER. Mr. Speaker, on Thursday, February 24, my esteemed friend the gentleman from Pennsylvania [Mr. MOORE], in his usual impassioned manner, referred to the sinking of the American steamships *Evelyn* and *Carib* in the North Sea, presumably by coming in contact with mines, and urges the President of the United States to suspend the activities of the War Risk Board.

The gentleman dwells upon the fact that the *Evelyn* and *Carib* were built in Scotland and had been repaired in American shipyards and were flying the American flag, as of peculiar significance in connection with that disaster.

The inference to be drawn from the gentleman's statement is that the War Risk Board are at fault for having assumed the war risk on foreign-built ships. He seems to think the fact that the *Evelyn* was built in Scotland in 1883 and the *Carib* was built in Scotland in 1882 had something sinister to do with the war risk assumed by our Government; that if they had been built in an American shipyard the hazard from mines would have been less and the fate of the vessels would have been different.

The age of the vessels had nothing to do with their fate. They did not sink in a storm at sea or under circumstances that showed them not to be in a seaworthy condition.

Their fate would have been the same if they had been new vessels just launched from an American shipyard and on their maiden voyages.

The deadly mines are as effective against new as they are against old vessels. In either event the hazard is equally great. Hence, all the gentleman had to say as to the age of the vessels and that they were foreign built is nonsense and bears no relation to the loss of these ships.

They were under the American flag, and lawfully so; they belonged to American citizens, and had been practically rebuilt in American shipyards, and with American material and by American labor.

When so repaired or rebuilt they were entitled to American registry under the act of December 27, 1852 (Rev. Stats., sec. 4136), which provides:

> The Secretary of the Treasury may issue a register or enrollment for any vessel built in a foreign country whenever such vessel shall be wrecked in the United States and shall be purchased and repaired by a citizen of the United States, if it shall be proved to the satisfaction of the Secretary that the repairs put upon such vessel are equal to three-fourths of the cost of the vessel when so repaired.

They were repaired or rebuilt and admitted to American registry and became entitled to all the rights of a vessel of the United States in 1898 and 1899, respectively, under the administration of President McKinley.

What a pity the gentleman was not then a Member of Congress to raise his clarion voice against the admission of these vessels to American registry. He might not have prevented it, but he could have railed against it, although his railings might not have been any more effective than they are under the present administration.

The fact that the balance of trade of the United States for January in our foreign commerce amounts to about $125,000,000 and bids fair to exceed $1,000,000,000 for the fiscal year seems to wound the gentleman deeply. He does not know any better way to stop it than to thwart the efforts of the administration to meet effectively the extraordinary conditions growing out of the war in Europe and to protect and foster and increase our foreign commerce. He would withdraw every ship under the American flag from the high seas. He would abolish the War Risk Board and repeal the ship-registry act of August 18, 1914. He would deny to us our right as a neutral nation to trade with the belligerents. For partisan advantage he would paralyze our foreign commerce or give it over to the shipping of other nations, to be exploited at will.

The cargoes of the *Evelyn* and *Carib* were cotton and noncontraband of war, and vessels and cargoes were entitled to the protection accorded by international law to the vessels of neutral nations.

The administration will hardly pay heed to the suggestion of the gentleman from Pennsylvania. The activities of the War Risk Bureau will not cease. What we need is more ships under the American flag in our over-sea trade, rather than the suspension of the valuable work of the War Risk Board. The following telegram from W. N. White & Co., dealers in fruits and general produce, 76–78 Park Place, New York, just received by me, is only one of thousands of cases brought to the attention of Congress in proof of the fact that we need more ships under the American flag in our over-sea trade:

NEW YORK, *February 26, 1915.*

Hon. J. W. ALEXANDER,
House of Representatives, Washington, D. C.:

Mercantile marine, which virtually controls New York and Boston interest to-day, want 5 shillings and 5 per cent, say $1.25, freight on American apples for Liverpool, ordinary cargo that was 3 shillings and 6 pence six months ago and 2 shillings and 9 pence two years ago. Value here of said apples are only $1.50 to $2.50 per barrel against $4 two years ago.

W. N. WHITE.

The rates of war-risk insurance will doubtless be increased to cover the increased hazards of navigating the North Sea and growing out of the order of the German Admiralty extending the war zone to the British Isles. It is proper that this should be done. Not one dollar of the loss thus far sustained is a charge upon the Treasury of the United States. The earned premiums on risks heretofore assumed by our Government amount to $752,041.47. The losses on the *Evelyn* and *Carib*, as far as known, amount to $659,103. It may be there will be other losses, and it may be they will exceed the premiums earned and become a direct charge upon the Treasury, but when we take into account the immense advantage of our country in fostering and promoting our foreign commerce, as shown by our huge trade balance from month to month, the possible losses through our war-risk insurance of vessels and cargoes under the American flag may be regarded without grave concern.

I will here insert a memorandum furnished to me at my request by the Secretary of the Treasury; also a statement prepared by him and given to the press on February 24, relating to the business transacted thus far through the War Risk Board since its creation September 2, 1914:

TREASURY DEPARTMENT,
Washington, February 24, 1915.

MEMORANDUM FOR THE SECRETARY.

Nine hundred and sixty-one policies issued September 2, 1914–February 23, 1915.

Total amount insured	$56,645,084.00
Premiums on same	1,502,302.09
Of the above amount the earned premiums (on $28,796,154) are	752,041.47
Therefore, net amount at risk	27,848,930.00
Known losses to date:	
Steamship *Evelyn*	401,000.00
Steamship *Carib*	258,103.00
Total	659,103.00

—

WASHINGTON, D. C., *February 24, 1915.*

STATEMENT BY SECRETARY M'ADOO.

The total insurance carried by the Bureau of War Risk Insurance of the Treasury Department upon the steamship *Evelyn*, reported sunk off Borkum Island February 19, and the steamer *Carib*, reported sunk in the North Sea February 23, is $659,103, which is covered entirely by premiums already earned by the Bureau of War Risk Insurance.

The total premiums received by the bureau up to and including February 23 amounted to $1,502,302.09. Of this $752,041.47 has actually been earned and all risks released. The $659,103 represents the maximum possible liability of the Bureau of War Risk Insurance in connection with the sinking of the two steamers. This does not take into account the possibility of salvage. The condition of the sunken steamers at this time is unknown. Cotton is rather easily salvaged, and it is possible that the cargoes are not beyond recovery. If so, this would mean a material decrease in the possible loss.

The total amount of insurance so far written by the Bureau of War Risk Insurance is $56,645,084, and the sinking of these two steamers represents the first loss suffered since the bureau was organized on September 2 last.

The details of the insurance of the *Evelyn* and the *Carib* are as follows:

"EVELYN."

Hull	$100,000.00
Cargo	301,000.00
Total	401,000.00
Premium	13,030.00
Net insurance	387,970.00

"CARIB."

Hull	22,253.00
Cargo	235,850.00
Total	258,103.00
Premium	7,965.62
Net insurance	250,137.38

Mr. Speaker, in this connection I will avail myself of the privilege of incorporating as part of my remarks an editorial which appeared in the Scientific American of February 20, and the article written by me for the Scientific American on the ship-purchase bill and referred to in the editorial:

THE ADMINISTRATION VIEW OF THE SHIPPING BILL.

The attitude of the Scientific American to the ship-purchase bill (a measure which has thrown Congress into a deadlock as remarkable as any that has ever occurred) must, by this time, be perfectly clear to its readers. Our opposition to the bill is the outcome of many years of study of the problem of our merchant marine, and it is based upon a serious conviction that the administration measure does violence to certain fundamental economic and political principles, the violation of which is certain to doom this or any other specious and ephemeral enterprise of this kind to disastrous failure.

At the same time we realize that it will greatly assist our readers in arriving at a more just conclusion as to the merits of the bill if both sides of the controversy are laid before them clearly and, as far as possible, without prejudice. The arguments of the opposition to the measure we have endeavored to make clear in the series of articles which have appeared in our columns during the discussion of the bill.

It now gives us great pleasure to present elsewhere in this issue an article written at our request by Representative JOSHUA W. ALEXANDER, chairman of the House Committee on Merchant Marine and Fisheries, who introduced the ship-purchase bill in the House. The article has all the force, logical sequence, and clarity of statement which one would expect from Judge ALEXANDER in the summing up of an important case. No one can read his statement without being possessed of a perfectly clear understanding of the motives, underlying principles, scope, and purpose of this measure. We now can follow intelligently the sequence of external events and internal mental processes which led the administration, after a survey of the conditions existing in our merchant marine and our over-sea commerce, to present this measure as the very best which it can offer as a solution of the present difficulties.

THE GOVERNMENT SHIP-PURCHASE BILL—A DEFENSE OF THE ADMINISTRATION'S POLICY.

[By Judge JOSHUA W. ALEXANDER, chairman of the House Committee on the Merchant Marine and Fisheries.]

During the fiscal year 1914 the foreign commerce of the United States amounted to four and a quarter billion dollars. The imports were nearly two billions of dollars and the exports over two and one-third billions of dollars. Not more than 10 per cent of this commerce was carried in vessels flying the American flag. It is estimated that foreign shipowners collect from the American people $250,000,000 to $300,000,000 a year for the ocean transportation of passengers and cargoes to and from the United States. This sum materially affects our trade balance. Just prior to the European war we had ships of only 1,376,809 tons gross in the foreign trade. It is estimated that soon after war was declared 5,500,000 tons of foreign shipping was withdrawn from the ocean carrying trade and that 550,000 tons of German and Austrian shipping is interned in American ports.

The war in Europe had hardly begun when the American people became keenly sensible of the imperative need for an American merchant marine. England, France, and Germany, our principal carriers, were at war, and we needed vessels clothed with the rights of neutrals to carry our over-seas commerce. The ship-registry act, admitting foreign-built ships to American registry for the foreign trade and suspending temporarily the provisions of our navigation laws requiring the captains and watch officers on vessels of the United States to be American citizens, was passed August 18, 1914.

The administration was assured that the passage of this act would bring a large measure of relief.

No sooner was it passed, however, than the same interests called the attention of the administration to the fact that Great Britain, France, and Germany were writing war-risk insurance on vessels and cargoes under their flags, and unless our Government would do likewise the ship-registry act would not be much help. An act was promptly passed by Congress and approved by the President creating a War Risk Board in the Treasury Department, and the Government has since written millions of dollars of war-risk insurance on vessels under our flag. No serious objection was urged to this legislation upon the ground that the Government should not engage in the insurance business. The emergency had to be met, and private companies were impotent. This measure was urged by the people who now object to the Government ship-purchase bill and denounce it as paternalism and State socialism. They were to be the beneficiaries if the Government engaged in the insurance business. All the people will be the beneficiaries if the latter bill becomes a law.

After the ship-registry act and the act creating the War Risk Board were passed it was represented to the administration and to the committees in Congress having jurisdiction of the subject matter that on account of the disturbed financial conditions growing out of the war in Europe it was impossible for private persons, firms, and corporations to purchase foreign tonnage and bring it under the American flag, unless the Government would guarantee their bonds or lend them money, or in some other manner give them aid. This was the situation when I introduced the ship-purchase bill.

With our foreign commerce paralyzed and our utter dependence on the shipping of Great Britain for service and her interests sharply antagonistic to our own, with ocean freight rates mounting higher and higher every day, and facilities under our own flag distressingly inadequate, it was thought by those charged with responsibility in the premises that if the Government must carry all these burdens in the interest of private shipping and give private shipping a free hand to exploit our commerce and charge all the traffic would bear it would be wiser to provide by law for a Government owned and controlled merchant marine, operated in the interest of the agricultural, manufacturing, and commercial interests of the United States, and give that service at reasonable rates and at the same time compel other lines to do likewise. And right here is the rub. There is no reason to believe that the Government will enter into competition with the established lines where they are giving the people good service and at reasonable rates. It would be folly to do so.

What are the fundamental proposals in the ship-purchase bill now pending in Congress, which the shipping interests are opposing so violently?

The bill provides that the United States, acting through a shipping board, may subscribe to the capital stock of any corporation or corporations now or hereafter organized under the laws of the United States or of any State or of the District of Columbia, the object of such corporation to be the purchase or construction, equipment, maintenance, and operation of merchant vessels in the trade between the Atlantic,

Gulf, or Pacific ports of the United States and the ports of Central and South America and elsewhere to meet the demands of the foreign commerce of the United States, or to charter vessels for such purposes and to make charters or leases of any vessel or vessels owned by such corporation to any other corporation, firm, or any individual to be used for such purposes, subject to the approval of the shipping board.

The initial stock of the corporation shall not be over $10,000,000, the shares of the par value of $100. The capital stock may be increased by the shipping board with the approval of the President. The United States shall subscribe for 51 per cent of the stock and each increase. The remainder may be subscribed for by the public, or by the United States if not subscribed for by the public. The United States, through the shipping board, with the approval of the President, is authorized to purchase or construct vessels, to transfer them to such corporation, and to pay for same by issue of Panama Canal bonds. Such corporations shall make provision for sinking fund and for depreciation charges, under the rules and regulations to be prescribed by the shipping board. The vessels purchased or constructed under the act shall be entitled to registry under the laws of the United States, but may engage only in trade with foreign countries or with the Philippine Islands, Hawaiian Islands, Porto Rico, and the islands of Guam and Tutuila.

The Secretary of the Treasury, the Secretary of Commerce, and three additional members, two of whom shall have practical experience in the operation of vessels in the foreign trade, subject to the direction of the President, constitute the shipping board, and are vested with power to vote the stock of the United States in such corporation and to do all other things necessary to protect the United States and to carry out the purpose of the act, and, with the approval of Congress, may sell the stock of the United States in such corporation.

The President is given the power to charter naval auxiliaries and vessels belonging to the War Department suitable for commercial uses and not required for naval or military purposes in times of peace and vessels owned and operated by the Panama Railroad Co. to the corporation created by the act, the vessels purchased or constructed to be of a type, so far as our foreign trade may permit, suitable for naval auxiliaries. The President is authorized to take them over for use as naval auxiliaries or for other purposes and at a reasonable price of rental.

Powerful private interests are arrayed against this bill. The representatives of special privilege and the powerful organization known as the Shipping Trust, with its affiliations in the domestic and foreign trade, oppose it. They are vociferous in the expression of their fears that the passage of the bill will involve us in grave complications with the belligerents. They may be counted on to promote legislation when it is for their benefit and will increase their profits, but view with grave concern legislation for the general welfare. Another class opposes Government ownership, honestly believing it is not a proper function of the Government. The first class also takes advantages of the reasons urged by the latter to defeat this legislation. None of these classes has proposed a rational plan as a substitute for the administration bill.

It is assumed that Government ownership is something new under the sun. Those who urge this objection assume that the American people are ignorant of the many activities of the Government in which the principle is applied. Private enterprise failed to build the Panama Canal, and the Government took over that great enterprise and has completed the canal in the interest of the world's commerce and for the national defense. The Government owns and operates the Panama Railroad. It was relocated and rebuilt within the last five years at a cost of about $10,000,000; also owns and operates the Panama Railroad Steamship Co.'s fleet of passenger and freight steamers from New York to Panama, and has done so for 11 years past. The average rate of freight between New York and the Canal Zone at the time the Government took over the operation of the line was $8 per ton. This has been gradually reduced to the present rate of $3.50 per ton on rough goods and $4.50 per ton for general cargoes. The reductions made by the Government line similarly affected the rates by the other lines, all of which were of foreign registry. The result has been an immense saving to the Government in cost of construction of the canal; at the same time no complaint has been made that the reduced rates have not been remunerative to the foreign as well as to the Government line.

The War Risk Insurance Bureau is a Government activity that has worked well. The rates are one-eighth of 1 per cent. What they would be if the business was being done by private companies must be left to our imagination. The Government has a splendid fleet of vessels in the Revenue-Cutter Service under control of the Treasury Department. The successful and economic management of this fleet requires as high, if not higher, order of skill and efficiency than is required in the management of a fleet of merchant vessels.

The Government, through the Post Office Department, has taken over a large part of the transportation business heretofore done by the express companies and at a reduction of cost to the American people of about 50 per cent, and little heed would be paid to a demand to abolish the parcel post upon the ground that the Government should not engage in the transportation business.

The Government is building a railroad in Alaska at a cost of forty millions of dollars to unlock the mineral wealth of that great storehouse of nature for the benefit of all the people rather than have it exploited for the benefit of the few. It is to be hoped if the Government goes into the steamship business it will prove a greater success than has the operation of our railroads under private control, notably the New Haven under the Mellen régime.

The Government owns the greatest wireless system in the world, under the control of the Navy Department, which not only renders efficient service for all the departments of the Government but does a large amount of commercial business at reasonable rates, and could do more without additional expense of operation. Yet it is assumed that the Government should not engage in the ownership and operation of shipping in the foreign trade to meet the demands of our growing and expanding foreign commerce, although private capital has failed for 50 years to provide such service for the American people.

The Washington Post of February 7, in an editorial, very pertinently remarks: "Private capital knows full well that it can not and will not establish an American merchant marine without the aid of public cash contributed in some way, form, or manner by the Government. It is to the interests of foreign shipping combines that no American merchant marine be established. It is to the financial interests of powerful representatives in the country of foreign shipping—commercial and financial interests—that no American merchant marine be established unless they can control it, save their European allies from American competition, and make such rates for freight and passengers as will afford them large profits. They are entirely willing to draw financial aid from our Government if the control of the marine is given them."

Up to the European war our foreign commerce was in the grip of foreign shipping lines. These lines were controlled by shipping rings and competition for the most part had been eliminated. Rates had increased in the last few years 50 to 200 per cent. These combinations were so powerful in all the trade areas of the world that no independent ship lines dared to enter the field and compete with them.

SUMMARY OF THE MOST STRIKING INCREASES.

Since the outbreak of the war in Europe the following are striking illustrations of ocean freight rates:

Ocean freight rates on grain from New York to Rotterdam have been increased since the outbreak of the war 900 per cent; on flour, 500 per cent; on cotton, 700 per cent. From New York to Liverpool the rates on the same commodities have increased from 300 to 500 per cent. From Baltimore to European ports, excepting German, rates have been increased on grain 900 per cent; on flour, 364 per cent; on cotton, 614 per cent. From Norfolk to Liverpool rates on grain have been increased from 157 to 200 per cent; on cotton, 186 per cent. From Norfolk to Rotterdam the rates on cotton have been increased 471 per cent; to Bremen the rates have increased on cotton 1,100 per cent, namely, from $1.25 per bale to $15 per bale. From Savannah to Liverpool the rates have been increased on cotton 250 per cent; to Bremen the rates have been increased on cotton 900 per cent. From Galveston to Liverpool the rates have been increased on grain 174 per cent; on cotton, 361 per cent; to Bremen the rates have been increased on cotton 1,061 to 1,150 per cent.

CONTROL OF RATE SITUATION BY STEAMSHIP INTERESTS.

Ocean freight rates are still rising, and are limited only by the greed of the steamship owners on the one hand and by what the traffic can stand on the other. The Government has no power to control or regulate ocean freight rates; it can not, under existing law, protect our foreign trade against these extortionate and hurtful charges. The steamship owners can increase rates without notice upon the instant, and our business men are helpless. The steamship companies are their own masters, and they do as they please with the transportation of our exports. As already shown, they are seriously checking our foreign trade, and in some cases, such as lumber and coal, are stopping it altogether.

It may be that we can not buy any ships. If so, great is the pity. The situation is exasperating, and demands a heroic remedy. The shipping combine, who are so deeply concerned lest our Government would involve us in serious complications with the belligerents if we would buy some of the interned ships belonging to the subjects of Germany, should contain themselves in patience. The President of the United States, under whose supervision this law will be administered, may be trusted to have a greater regard for the public welfare than they have shown and to observe in letter and spirit our duties as a neutral; at the same time he will demand that the belligerents shall recognize our rights as such.

One thing is certain, the present situation has demonstrated our absolute need of an American merchant marine, not only to extend and protect our commerce in the overseas trade but as an arm of the national defense. It is to be hoped that this lesson will not go unheeded and that selfish interests may give way to the general welfare. The plan proposed may not be the best that could be devised, but it is worthy of the consideration of all thoughtful and patriotic American citizens.

As yet no better plan has been proposed.

Our Flag.

EXTENSION OF REMARKS

OF

HON. J. M. C. SMITH,

OF MICHIGAN,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, February 24, 1915.

Mr. J. M. C. SMITH. Mr. Speaker, under the leave granted me by the House to extend my remarks in the RECORD on our flag, I herewith present the very excellent patriotic poem written by Mrs. Marion Watkins, of Sherwood, Mich., wife of a Civil War veteran of my district.

The poem is as follows:

What! change our flag, our country's flag,
The flag our forefathers planned,
That should mean so much to everyone
Whose home is in our land.
You can not take from or add to
One single thing to-day
That would make it mean more than it does,
Our flag of the U. S. A.
It stands for all that makes us great
And wisely was it planned,
A star to shine for every State
And the one flag for our land.
You may change all other things if you wish
But let this stay for aye,
Our grand Old Flag of the Stars and Stripes,
Our flag of the U. S. A.
For we all know that field of blue
Is only for each State
And none but traitors to our flag
Would that field desecrate.
No other emblem do we need
Or color there to show
The principles for which it stands,
For that all nations know.
It has stood for over one hundred years
And is our Nation's pride,
For it were shed a million tears
And a million for it died.

Then why ask Congress now to change
One thing upon our flag,
For it means more to the boys in blue
Than just a pictured rag.
Around their heartstrings twines this flag,
It cheered and led them on
From victory, on to victory
Our flag of Washington.
They see their comrades as of yore
In battle's fierce array,
They hear the shots, they see them fall
For our flag of the U. S. A.
Can they remain unmoved, unhurt,
And see them place a stain
On the emblem of their sacrifice
And feel it was all in vain?
They want one flag, and only one
To float o'er our land for aye,
And that to be the Stars and Stripes,
Our flag of the U. S. A.
Our flag has passed through many wars
And was born in freedom's cause
And for liberty and union stands
And our just and righteous laws.
'Tis our soldiers' flag, 'tis our citizens' flag,
'Tis the flag of every one
Who dwells beneath its sheltering folds
Our flag of Washington.
No North, no South, no East, no West,
For all are one to-day;
All claim protection 'neath this flag,
Our flag of the U. S. A.
For each a star is shining there
Upon its field of blue;
Oh, do not mar or change a star
To grieve the brave and true.
Oh, keep unchanged our Stars and Stripes
For your sons to hold for aye
As a heritage from Washington,
Our flag of the U. S. A.
Into their hands this glorious flag
By their grandsires was given,
To keep unstained its honor bright,
With their hands high raised to heaven.
Our country's heroes, great and good,
And all her noble sons
Have lived and prospered 'neath the folds
Of our flag of Washington.
This flag we love all others above
And forever may it stand
Among the galaxy of flags,
The proudest in any land.
Oh, men in Congress, you who wield
Much law and power here to-day,
You will not, must not, let them change
Our flag of the U. S. A.
If you change it once, you can again
Till there would not remain
One vestige of our dear Old Flag
That millions died to sustain.
E Pluribus Unum, our motto is,
And all that it implies,
Liberty and union, now and forever,
As long as the Old Flag flies.

Opium and Habit-Forming Drugs.

EXTENSION OF REMARKS

OF

HON. JULIUS KAHN,

OF CALIFORNIA,

IN THE HOUSE OF REPRESENTATIVES,

Wednesday February 24, 1915,

On the bill (S. 6631) to regulate the practice of pharmacy and the sale of poison in the consular districts of the United States in China.

Mr. KAHN. Mr. Speaker, I heartily favor the pending legislation. Students of the subject everywhere view with alarm the great increase of the use of habit-forming drugs in every section of the civilized world. Here in the United States many well-intentioned, well-meaning persons are maintaining a vigorous crusade against the manufacture, purchase, and sale of intoxicating liquors. To my mind the excessive use of such intoxicants will never bring in its train the wretchedness, the misery, and the crime that results from the use of opium and other habit-forming drugs. It were well if the ladies and gentlemen engaged in the prohibition propaganda in these United States would devote their earnest attention to this subject of the increased use of habit-forming drugs at once before the habit becomes so deeply implanted throughout the United States that the danger will have been done before remedial laws are enacted. The pending bill refers to the sale of these poison drugs in the consular districts of the United States in China. That great Empire, with its millions of inhabitants, has learned what it means to have a large percentage of its population besotted and degraded by the use of opium. The great Chinese statesman and philosopher, Li Hung Chang, left a vivid picture of the degrading influence of the use of opium among the Chinese people in his memoirs. On page 285 of said memoirs, edited by William Francis Mannix, and published by Houghton, Mifflin Co. in 1913, is found the following:

VICEREGAL YAMEN, TIENTSIN, 1893.

A statement has been translated to me from one of the London papers in which I am quoted as saying to the Hon. George N. Curzon that I do not, in common with most Chinese, hold Great Britain responsible for the importation of opium into China.

In the first place, I never in my life made such an outrageous assertion; in the second place, I feel sure that Mr. Curzon never said I did; and, in the third place, both Mr. Curzon and myself, as well as every well-read and intelligent Britisher or oriental, is aware of the unhappy and disgraceful fact that but for Great Britain there would not be a picul of opium sold in China to-day for illegitimate use; by this I mean for use outside the legitimate practice of medicine.

This may appear to be a strong assertion, and I have no doubt it will be as strongly denied and condemned; but it is a true one, nevertheless, and the entire history of trade and traffic in the Orient will substantiate my every word.

A great many fine Englishmen have been friends of mine, and I number to-day many of that race among my intimates—ministers and consuls, army and navy officers, engineers, and hundreds and hundreds of merchants. These men know that I have great admiration for them and their race, and, in all seasons and times, for their sacred and virtuous Queen. But for the Government, so far as it has made itself not only the agent but the guardian of the vicious opium trade, I have a very sincere dislike.

I know that because of this money-grasping, trade-compelling feature of England's dealings with my country millions of wretched people of China have been made more miserable, stalwart men and women have been made paupers, vagrants, and the lowest of criminals, and hundreds of thousands of the weaker ones of my race—mainly among the women—have been sent to suicide graves.

And all this because otherwise India might not prosper!

And all this because otherwise British trade might not flourish in Chinese ports!

All this because gold and territory are greater in the eyes of the British Government than the rights and bodies of a weak people.

Yes! Yes! Yes! We Chinese have been laughed and sneered at in the streets of London itself, and have been called "pig-tailed opium eaters," when for years and years it is the Government of these same Londoners which has been responsible for the millions of human wrecks throughout the length and breadth of the Middle Kingdom.

I was asked once by a British admiral at Amoy what my estimate of the number of opium users in China would be. I did not reply directly, but questioned him as to the population of England, and when he told me in the neighborhood of 27,000,000 I said: "Admiral, that is about the number of opium fiends in China."

He said he did not get my meaning.

Then I told him that, as his country was responsible for the vicious traffic, each man and woman and child in England might well feel that there was at least one wretched being in China as a representative.

In this relation I have often taken my pen and from records before me made estimates of the number of unfortunates in this great Empire of ours, and each time have my figures told me that about one-tenth of our people are victims of a vice that has no parallel anywhere on earth. I could wish that I might make the figure smaller, but as I have gone over my calculations time and time again, and as they include the most wretchedly diseased Provinces of Yunnan and Szechuan, I feel that my estimates are too low rather than too high.

It must not be imagined that I am so ignorant of history as to claim that England or any other of the western nations was responsible for the introduction of the cursed drug into China. No; it came from the island of Java 200 years before the "opium war," gaining its strongest hold along the coast and in Formosa. Kang H'sai sent an official to inquire into the evil in Formosa, and he died there. Others followed, became addicted to the curse, and died also. Later, travelers and traders crossing from India and the Mohammedan countries introduced it into the western Provinces, and still later this devil's extract entered the country as gifts to princes and others in high places.

I am fully aware of the growth of the vice in China, for even as a boy at school I saw its ravages, and I inquired whence it came, and why it was brought. Even a bosom friend and student—whose name I do not just now recall—became a victim of the habit, left his home, and was finally stoned to death by order of the magistrate because he had become entirely bereft of reason and decency.

Yes; in all my years—in my studies, in the army, during the wars and the famines, in all my political and business life—I have studied and combated this devouring evil, and the more I know and see and learn of it the greater does England's crime become in my eyes. England—proud and mighty and rich England—England with her great armies and navies and great men—is ashamed and covered with ignominy because of the crimes of her Indian poppy.

It has been stated times without number, and upon several occasions directly to my face, that, while I was seemingly opposed to the traffic, I myself, personally or through agents, had dealt in the drug, having grown poppy upon my own lands, and having leased lands both in Hupeh and Pechili for its cultivation. I have never denied the truth of these statements, and in this writing (a copy of which I intend to send to the Times correspondent at Peking and another to the Hon. Mr. Curzon) I shall acknowledge that the foregoing assertions are true.

But I will immediately say, in order that my honor and my conscience be satisfied, that to my knowledge not one farthing's worth of the opium in which I dealt ever went for smoking purposes. I would have my secretary prepare, if such were necessary, a list of the high medical firms and men with whom I have had business dealings in opium, and it could easily be shown that they are not only of the best medical repute in China, Japan, and Russia, but that they, almost without exception—I speak particularly of Chinese doctors and concerns where I have had dealings—are as bitterly opposed to the habit and traffic as I myself am, such men and firms as could not be approached by users of the drug or by users' agents in any way. Of course, so far as concerns what has become of the commodity sent to Japan and Russia, I can not say, only I feel certain from the price and the grade dealt in that very little, if any, has ever reached the so-called drug fiend. As to the lands I have leased for agricultural purposes, I can only say that never has there been a stipulation for or against the poppy; but where I have found the plant growing upon my lands I have always endeavored as a mere matter of business to have the crude product sold to myself.

And still another view of this question has been taken. The Chinese Government has, on more than a few occasions, been asked almost directly this question: "If you regard the importation of opium into your country in the light of such a dire evil, why is it that you do not make and enforce laws prohibiting the growth of the poppy within your territory?" And our Government has always replied: "Of what avail would it be when we are still 'compelled' to open our ports to the drug from India?"

Could any question, really a question from one Government to another, be more ridiculous, and could any answer be more to the point?

I know that for more than 20 years there have been repeated attempts made by outside interested parties to have the sternest edicts issued from the northern capital against the growth of the poppy throughout China. Mark me, not against the use of the drug, the deadly and benumbing drug, but against the cultivation of the plant from whose pod the poison is extracted.

I know, furthermore, that large sums of money were ready to fall into the hands of certain high officials if they could secure such an edict from the palace.

What would the object of this be?

The man who could not grasp the meaning of this knavish attempt would, indeed, lack the mentality of a blind toad.

No; the rich Indians, backed by the diplomatic force and physical strength of the British Empire, would not alone rob millions of degraded Chinese of their mental and bodily strength, but they would sap the last cash from the land of their victims. They would drain our beloved country in every way, and leave us helpless dupes of the poppy farmers of India.

I want to say that I am not of those of my countrymen who have been in opposition, either openly or secretly, to the advance of the Western Church in China. On the contrary, I have from very early days welcomed the missionary of the West as well as the merchant or the engineer, and I hope to continue in this attitude to the end of my days, for it is my earnest belief that the sooner China awakens her vast body to all that is good in the West, without sacrificing her own virtues and high qualities, without neglecting her own splendid philosophy and beautiful literature—the gifts of her sages and poets for centuries and centuries—the sooner will she take her place among the powers of this age, and the sooner will her people rise to a higher and better plane.

But it must be understood by all the western peoples that Christianity has suffered a much slower growth among the Chinese because of this one curse of opium. Indeed, what are our people, mandarin and coolie, rich man and pauper, scholar and unlettered man, to think, when they all know that the blackest and most deadly virus that has been injected into the nation, year after year, decade after decade, has been forced upon it by a Christian power? It is not the scholarly and high and powerful who become converts to the Church of the West. No. Neither do these classes, as a rule, go into the gutters and to the prisons on account of the opium curse; but they see the vice all about them; the groveling wrecks, the opiated bodies in the execution places, the wretched criminals, the deserted wives of the victims, and the unburied suicides upon the plains and along the paths. And they know that a great nation, a Christian nation above all things, has given this awful blight to the Middle Kingdom.

What are they to think?

Address of Hon. Joseph E. Davies, United States Commissioner of Corporations, Before the Chamber of Commerce of the United States, Thursday Afternoon, February 4, 1915.

EXTENSION OF REMARKS

OF

HON. CHARLES C. CARLIN,

OF VIRGINIA,

IN THE HOUSE OF REPRESENTATIVES,

Friday, February 26, 1915.

Mr. CARLIN. Mr. Chairman, I ask unanimous consent to print as a part of my remarks the address of the Hon. Joseph E. Davies, present United States Commissioner of Corporations, who has been nominated as a member of the Federal Trade Commission; and as his remarks have peculiar significance and are of great interest to the industrial world, I desire to incorporate them in the RECORD for the general information of the public.

The SPEAKER. Is there objection to the request of the gentleman from Virginia.

There was no objection.

The address is as follows:

THE FEDERAL TRADE COMMISSION.

ADDRESS OF HON. JOSEPH E. DAVIES, UNITED STATES COMMISSIONER OF CORPORATIONS, BEFORE THE CHAMBER OF COMMERCE OF THE UNITED STATES, THURSDAY AFTERNOON, FEBRUARY 4, 1915, AT 2 O'CLOCK P. M.

The problem of the relation of business to industry is world-wide. The principle of the Sherman law is not confined to the United States alone.

PRIVATE MONOPOLY ABHORRENT TO SELF-GOVERNING PEOPLE THE WORLD OVER.

Wherever there is a conscious attempt at popular self-government the world over there will generally be found a legislative attempt to destroy the power of monopoly. The Republic of France, the Governments of Canada, Australia, New Zealand, the South African Union, all make monopoly, or attempts to monopolize, crimes against the State.

MONOPOLY AND SELF-GOVERNMENT INCOMPATIBLE.

This is so because private monopoly is the denial of freedom, which self-governing peoples demand. It is the negation of democracy. Monopoly is monarchy. Political equality is a farce if industrial freedom in opportunity is denied. Unless the latter obtains, the former will be throttled and translated into political absolutism. The forms of the criminal and civil statutes, the machinery for the enforcement of the law, may differ with the character of the peoples of the various countries; but the conscious legislative attempt to destroy monopoly, as a menace to freedom, is present wherever government is immediately responsive and subject to the control of its subjects.

That is the significant fact in a survey of world-wide evolution of industry and its relation to government.

METHODS OF REGULATION IN FOREIGN COUNTRIES.

The machinery of government, by which the destruction of monopoly and the regulation of competition is sought, varies. In Austria, France, and England it has been left to the courts. In Canada the judicial processes have been supplemented by a procedure which, upon complaint of persons injured, permits the question of attempted monopolization to be investigated by a temporary commission appointed by the court. In New Zealand it has been left directly to the courts, with the power vested in the governor, in council, to reduce the customs duties forthwith, to restore competition, if necessary to destroy local monopoly. It remained for Australia in 1912 to create an interstate trade commission, with a character of permanency and of expert qualification, and with broad investigating and quasi judicial power, to investigate conditions, to enforce the laws regarding commerce, and to aid Australian industry.

REGULATION IN THE UNITED STATES.

For 25 years in the United States the governmental machinery employed has been investigation by general legislative commission or administrative officer and the instituting of court proceedings by the Department of Justice. Under conditions of gigantic change in the economic and financial structure of society in this country and the world, the manner in which the courts have performed this arduous function, involving technical and economic knowledge of vast extent, will constitute a monument to the resourcefulness and commanding ability of the American judiciary.

In recent years, however, there has been evolved a new agency for executive and quasi judicial function in government designed to give greater resiliency and freedom of action and to afford relief that is more speedy, informal, and direct, which within constitutional limitation seeks to avoid the law's delays, and to fit the remedy to the wrong. It was in consonance with this development that the conception of the Federal Trade Commission was advanced. The need of the business community for such a governmental agency in this matter was voiced by the overwhelming vote of the associations of commerce, that constitute this national body, in favor of the creation by law of a Federal Trade Commission. The idea has been advocated directly or indirectly by men of all political parties, and has been urged by Attorneys General, economists, and publicists. It remained, however, for the President of the United States to give such impetus to the idea as to translate it into an enactment of law. The language employed by the President in his message to Congress declares the need so clearly and forcefully, and withal furnishes such insight into the possibilities of this instrument, that I shall repeat it here:

"And the business men of the country desire something more than that the menace of legal process in these matters be made explicit and intelligible. They desire the advice, the definite guidance, and information which can be supplied by an administrative body, an Interstate Trade Commission.

"The opinion of the country would immediately approve of such a commission. It would not wish to see it empowered to make terms with monopoly or in any sort to assume control of business, as if the Government made itself responsible. It demands such a commission only as an indispensable instrument of information and publicity, as a clearing house for the facts by which both the public and the managers of great business undertakings should be guided, and as an instrumentality for doing justice to business where the processes of the courts or the natural forces of correction outside the courts are inadequate to adjust the remedy to the wrong in a way that will meet all equities and circumstances of the case."

The Federal Trade Commission bill was enacted into law by practically a unanimous vote of both Houses of Congress, and was signed by the President September 26, 1914. The general features of this law are familiar to you by reason of the very strong and able report upon this matter prepared by your committee and referred to your membership with the referendum vote conducted by your association.

By this law there is to be constituted a nonpartisan body of men, of business, economic, and legal experience and training. Not more than three shall be members of any single political party. The term of seven years and the successive expirations of the respective terms insures continuity of purpose and that there shall be finally applied to this problem the judgment and experience of a body of business men of trained and specialized knowledge, who are designed not only to bring an understanding of the theoretical and economic and legal questions involved, but as well a sympathetic appreciation of the practical difficulties and troubles of industry, together with a comprehensive perspective of the industries of this country and the interests and welfare of the general public who are affected most by these conditions. It is the logical, scientific, and efficient way of meeting the situation.

POWERS OF THE TRADE COMMISSION.

Generally speaking, the powers with which the Trade Commission is clothed are of two kinds, investigative powers and quasi judicial functions. There is nothing new, novel, or unprecedented, or of an inquisitorial character in the investigatory powers conferred. The powers previously exercised by the Treasury Department, by the Secretary of Commerce, by the Interstate Commerce Commission, and by the Bureau of Corporations in obtaining facts with reference to banks, navigation laws, railroads, and corporations furnish abundant precedent for this delegation of power. Corporations are the creations of the State, and it is manifestly right that the Government, which created these instruments, should be permitted to obtain such facts with reference to their conduct as to be assured that the interests of the people who constitute the State are not harmed by their actions.

THE TRADE COMMISSION A CLEARING HOUSE FOR FACTS AND INFORMATION.

The Trade Commission is empowered to gather information with reference to the organization, business, conduct, and practices of corporations; to secure this information by reports such as it shall prescribe; to classify corporations and to make public, with due regard to the protection of trade secrets and lists of customers, so much thereof as is necessary in the public interest. By this means a great body of useful and correlated information may be gathered to furnish

perspective to government and to business. There are 314 different classes of industry, according to the classification made by the Director of the Census. Through reports of this kind there will be available information as to the nature and character of each of these industries, the degree of centralization in each, the dominant financial control, the degree of integration, their interlocking relationships, their respective difficulties and problems, their position, respectively, with reference to foreign trade, and other facts, all of which may be gathered together for affording to a disinterested Government agency, seeking only the public good and interested only in the public welfare, knowledge of and a general view of the whole make-up of the industry of the Nation, with reference not only to the financial and legal, but as well to the economically helpful aspects of the situation. Here, then, is created that which, in the language of the President of the United States, is "an instrument of information and publicity as a clearing house for the facts by which the public and the managers of great business undertakings should be guided." The justification of the commission will be found in large measure by the extent to which the assembling, digesting, and interpreting of these data shall develop into constructive aid to business enterprises of the country, and to the extent to which it will render service in giving a broad, sympathetic, and accurate basis for the action of this governmental agency in the discharge of its functions in the service of the general public.

INVESTIGATION UPON CONGRESSIONAL OR EXECUTIVE DIRECTION VIOLATION OF TRUST LAWS.

Upon the direction of the President or of either House of Congress the commission is authorized to investigate and report concerning any alleged violations of the antitrust acts by corporations, and whenever a final decree has been entered against any corporations in a suit to restrain violations of the antitrust acts the commission is authorized to make an investigation of the manner in which the decree is carried out, and, in case the investigation is made upon the application of the Attorney General, the commission will transmit a report of its findings and recommendations to the Department of Justice and publish such report in its own discretion.

DISINTERESTED EXPERT BUSINESS OPINION AVAILABLE TO THE COURTS.

The law further provides that if in any suit in equity brought by the Government under the antitrust acts the court is of the opinion that relief should be granted it may refer the matter to the commission as a master in chancery to make recommendations for an appropriate form of dissolution decree. Thus there is placed at the disposal of the courts the expert business knowledge and experience of a disinterested Government agency which is familiar not only with the conditions of the industry in the particular case at bar but which will have as well, in the course of time certainly, not only a broad understanding but also special information regarding the economic business and industrial conditions, all of which will be available in the aid of the courts, not only to the advantage of the litigants, but as well for the protection of the general public. This is the translation into law of the suggestion contained in the message of the President of "an administrative commission capable of directing and shaping corrective processes * * * in aid of the courts."

INVESTIGATIONS AND RECOMMENDATIONS TO BRING BUSINESS INTO HARMONY WITH THE LAW.

The Trade Commission act provides further that upon the application of the Attorney General an investigation of the business of any corporation alleged to be violating the antitrust acts may be made, and that the commission shall make recommendations for readjustment which shall bring it into accordance with the law. In the administration of the Department of Justice there has grown up in connection with trust cases a practice which may be described as the entry of "consent decrees." It is a situation wherein the Department of Justice in the enforcement of the antitrust laws consents to a settlement of the suit by prescribing what it shall require in the judgment or decree to be entered by the court, and wherein the defendants thereupon go into court and enter their formal consent to the entry of such judgment or decree as has been agreed upon. This method of accommodation of business to the requirements of the law contains within it possibilities for great good and equally great possibilities for disastrous harm. It has been used with the greatest of care and discernment by the Department of Justice in the past, and it is but natural that it would be used generally with a great deal of reluctance. Independent of the commanding abilities or the judgment of the Attorney General, the responsibilities involved are such as would necessarily cause a single executive officer to pause in the exercise of such power. By the foregoing provision of the Trade Commission act there is provided an additional agency available to the Department of Justice for bringing into harmony with the law the business practices of corporations. The Trade Commission furnishes a nonpartisan body of men familiar with the whole field of industry to which matters of this kind may be referred for investigation, examination, and recommendation. By reason of its nonpartisan character, and by reason of its technical knowledge, it may be assumed that the recommendation of such a body would fortify the judgment of the Attorney General in the estimation of the public, would relieve a single individual from the imposition of such a responsibility as this process necessarily involves, and might be productive of great good in the accommodation of business to law in the changing forms of our economic and legal development. This situation contains the suggestion of promise of a body of administrative law being built up which would be of great aid to business and of service to the country. It is a distinct contribution to the suggestion contained that the forces of correction should be adequate "to adjust the remedy to the wrong in a way which will meet all the equities and circumstances of the case."

INVESTIGATION OF FOREIGN COMBINATIONS INIMICAL TO OUR INTERESTS IN FOREIGN TRADE.

Much has recently been said in connection with the applicability of the Sherman law to foreign trade. It has been maintained, with much vigor, that the principles of the Sherman law should not be applied to business in this country that is engaged in foreign trade and in the extension of our foreign markets. In support of that contention it is urged that combination through a common selling agency is necessary in the foreign market in order to meet the competition of European cartels and other combinations of sellers in the markets of the world; that the small producer and manufacturer in this country can not extend his markets into a foreign field except through a common selling agency, because of the prohibitive cost involved; that if the inhibitions imposed by the Sherman law be placed upon combinations engaged in foreign trade in the United States it would operate to the serious prejudice of small producers and to the distinct advantage and benefit of trusts, which can afford and do establish substations in distant parts of the world; that the reasons for the Sherman law do not obtain in foreign countries and in foreign trade, because in an international market competition is secured for the benefit and advantage of the buyer through international contest for the market. On the other hand, it is urged with powerful force that to permit combinations for foreign trade in this country would furnish a very convenient and ready vehicle for the easy violation of the Sherman law at home, contrary to our public policy and to the serious disadvantage of our citizens. This phase of the controversy is a comparatively new one, and is fraught with great importance. The information on this subject is sparse and largely based on hearsay. What is necessary in the situation are the facts, and the Federal Trade Commission is intrusted with the duty of investigating in foreign countries combinations and other trade conditions which may affect the foreign trade of the United States. Undoubtedly, in conjunction with the Department of Commerce and with the Department of State, a large amount of information can be obtained which will give authoritative information as to the facts which will enable the lawmaking power of the Government to address itself to the problem with greater security and confidence.

QUASI JUDICIAL FUNCTIONS OF THE COMMISSION.

Both in the Trade Commission act and in the so-called Clayton Act certain important provisions of declarative law are enunciated, and the authority to enforce compliance with these declarations is vested in the Federal Trade Commission.

Unfair methods of competition: In section 5 of the Federal Trade Commission act itself the following very important provision of declarative law is stated:

"That unfair methods of competition in commerce are hereby declared unlawful."

The act provides that the commission is empowered and directed to prevent persons, partnerships, and corporations, except banks and certain common carriers, from using such unfair methods of competition, and establishes the procedure by which this may be done.

In addition to the substantive provisions contained in the Federal Trade Commission act with reference to unfair methods of competition, the Clayton Act contains certain prohibitions the enforcement of which is confided to the Federal Trade Commission as to corporations under its jurisdiction. The provisions of the law are very minute, and only the broad features are specified herein.

Price discrimination: Section 2 prohibits, in certain cases, price discrimination where the effect may be to substantially lessen competition or tend to create a monopoly in any line of commerce.

Tying contracts: Section 3 prohibits, in certain cases, so-called tying contracts—that is, contracts whereby, as a condition of sale or lease of commodities, the seller or lessor exacts from the purchaser or lessee an agreement that he shall not use or deal in other commodities except those furnished by the seller or lessor—where the effect may be to substantially lessen competition or tend to create a monopoly in any line of commerce.

Holding companies: Section 7 prohibits, in certain cases, so-called holding companies, or the ownership by one company of the stock of another, where the effect may be to substantially lessen competition between the companies concerned, or to restrain interstate commerce or tend to create a monopoly.

Interlocking directorates: Section 8 provides that two years after the enactment of the law so-called interlocking directorates shall be prohibited in certain cases, and in particular with respect to corporations having more than $1,000,000 capital stock and surplus, other than certain banks and common carriers, wherever they are or shall have been theretofore, by virtue of their business and location of operations, competitors, so that the elimination of competition by agreement between them would constitute a violation of any of the provisions of any of the antitrust laws.

Enforcement of the prohibitions of the Clayton Act: The authority to enforce the foregoing provisions of the Clayton Act is vested in the Federal Trade Commission as to all corporations which come within its jurisdiction, by section 11 of the said act.

Nothing could more clearly indicate the degree of discriminating care which the committees of Congress gave to this legislation than the phraseology of the Trade Commission act and the Clayton Act with reference to these prohibitions.

PROTECTION TO MODERATE-SIZED BUSINESS FROM UNFAIR COMPETITION.

Unfair methods of competition have been the chief weapons of monopoly. It is generally conceded that one of the greatest menaces to relatively smaller industrial units is to be found not in the superior efficiencies of the larger rival but in their being able to employ unfair methods to destroy a competitor by local price cutting under cost or similar unfair practices. Some of the most powerful monopolies of the world are alleged to have obtained their dominance by their ability to throttle competitors equally efficient but less able to bear this strain involved in withstanding attacks of this kind. An industrial unit of reasonable size may, by reason of the personal equation, favorable location, or other and similar advantages, be equally or more efficient than its monopolistic rival, but may be quite helpless if the monopoly be permitted to crush it by an unfair use of its power. This is of especial significance to the business of the country, because probably not 1 per cent of the three hundred and odd thousand corporations in the United States have attained to a size which would approximate a monopolistic character. The great body of the business community is interested in the preservation of the channels of trade and commerce free and open. The "rules of the road," which preserves the right of the Ford as well as of the high-powered motor car, must be enforced, and a Government agency is designed for just this function in the channels of trade in interstate commerce in the creation of the Federal Trade Commission. Not since the Sherman law itself has been enacted has there been so important and beneficial a piece of legislation in the interest of the great body of business men of this country as is to be found in the prohibition of unfair methods of competition. It may be true, as some allege, that some of these practices are already prohibited by the first three sections of the Sherman law, but there is also strength in the position that the agency for preventing these practices is usually invoked only after a very large number of practices can be proven to exist, under a blanket petition in equity or under an indictment that alleges not an isolated act but a series of acts constituting a conspiracy in restraint of trade. In such a situation there is too much danger that by the time the remedy is applied the patient should be in a very weakened and dangerous condition. Here is an agency that has been designed, as has been said, to destroy the very seeds of monopoly in their germination, rather than to permit them to develop into a vigorous and rank growth which will throttle the healthful upshoots in the industrial field.

PROCEDURE IN THE ENFORCEMENT OF THE LAW.

Briefly stated, the procedure in the enforcement of these substantive provisions of law declared in both the Federal Trade Commission act and the Clayton Act, as recited above, is the following:

Whenever the commission believes that any person, etc., has been using unfair methods of competition or violating the provisions of the Clayton Act, and that its intervention in the matter would be to the interests of the public, it shall serve a notice on the party complained of, who shall have the right to appear before it and show cause why an order should not be made to require that such practices cease. Other parties, for good cause shown, are allowed to intervene in the proceeding. On hearing had, if the commission shall be of opinion that the practices are prohibited by the act, it shall serve an order on the person complained of to cease and desist. If such person fails to obey the order of the commission, the latter may apply to the Circuit Court of Appeals to enforce the same and file a transcript of the record in the case. The court shall then take jurisdiction of the proceedings and have power to affirm, modify, or set aside the order of the commission, but the findings of the commission as to facts, if supported by evidence, shall be conclusive, and no additional evidence is permitted to be adduced without again referring the case to the commission for a rehearing. The only review of the judgment and decree of the court is by writ of certiorari to the Supreme Court, as provided by law. Any party required to cease from using such method of competition or from violating the aforesaid provisions of the Clayton Act may obtain a court review in a similar manner.

The judicial review of the orders of the commission thus provided for is what is sometimes termed a "narrow" review; that is to say, the commission's conclusions of fact are conclusive, if supported by evidence, but the court may modify or reverse the order on the basis of violation of constitutional provisions, absence of jurisdiction, or violation of the rules of procedure provided in the act.

THE OPEN ROAD AND DEMOCRACY.

Such in a general way is the statement of the purposes, the functions, and the possibilities of the Federal Trade Commission. Its present enactment into law is due, more than to any other single cause, to the sympathetic understanding, the genius for constructive statesmanship, and the vision of the President of the United States.

It holds promise of great aid to American business and of greater security for the liberties of our people. It is an attempt in an industrial era of great complication to translate the spirit of Faneuil Hall into terms of present-day freedom. Conditions of the present, and as well the freedom of opportunities in the long future for our children and their children, demand that the highways of trade shall be kept open and fair; that the "rules of the road" shall be preserved and enforced with reason and temperance, and with firmness and exact justice. It has been said that there are but three generations between shirt sleeves and shirt sleeves. Regardless of the magnitude of personal achievement, there can not be found a man in this country, in my belief, who does not desire that conditions shall exist and shall continue to exist in this country such as will enable his children and his grandchildren, if reduced in means, to have an opportunity, with a clear road and no favor, to achieve and build their fortunes and their character to the same degree and in the same manner as opportunities were afforded which made their forebears strong, powerful, and big.

But the great and momentous task which confronts the people of this country and the business men of this country in connection with this problem is bigger than such considerations. The problem reaches down to the fundamental question of the kind and character of the Government we shall evolve in this great experiment of government, which challenges, indeed, the existence of democracy itself. No republic ever has or ever will live except as it solves correctly its relation and the relation of all of its people to the production of wealth. Here lies a challenge to the big-mindedness of the captain of industry, to the philosophy of our economists, to the thought of our scholars, and to the patriotism of our citizenship.

The purpose and object of this legislation has been and is to convert the anarchy of unlicensed competition into a condition under law of competitive liberty which will preserve those seeds of individual initiative and enterprise which have contributed to the art, to the science, to the literature, and to the welfare of our civilization, so that the seeds may germinate and flower into still greater blessings for mankind.

The Federal Trade Commission is a part of this legislation and is one of the agencies designed by a Republic to aid in the solution of this problem that the industrial liberties and opportunities of the people may be preserved under a republican form of government. In the task which confronts it there can be no doubt but that the Federal Trade Commission will receive the effective, honest, and able cooperation of the business men of the United States, even as it received the sustenance and indorsement of this great body of the Chamber of Commerce of the United States in the period of its conception and during the period in which it was enacted into law.

The intelligence and patriotism which exists in business as in other fields of American activity will not permit that its functions should be interpreted into terms of menace, but will recognize that its functions are designed for and aimed at helpfulness, service, and greater security for the rights of men.

In the law of its creation there will doubtless be found imperfections—it would not be a human institution otherwise—but the Federal Trade Commission will grow and develop consonant with the service which it performs and commensurate with the usefulness with which it justifies its existence.

Address of Henry L. Stimson.

EXTENSION OF REMARKS

OF

HON. WILLIAM M. CALDER,

OF NEW YORK,

IN THE HOUSE OF REPRESENTATIVES,

Friday, February 26, 1915.

Mr. CALDER. Mr. Speaker, I am pleased to take advantage of the courtesy of the House in permitting me to extend my remarks in the RECORD by inserting an address by the Hon. Henry L. Stimson, formerly Secretary of War, before the Republican Club of the city of New York on February 15 on the "Military needs of our country"; also a copy of resolutions offered by me and adopted unanimously by the club. Mr. Stimson's address was, in fact, the report of the committee on national affairs of the Republican Club, of which committee I have the honor to be chairman:

ADDRESS OF HON. HENRY L. STIMSON BEFORE REPUBLICAN CLUB, FEBRUARY 15, 1915, ON "MILITARY NEEDS OF OUR COUNTRY."

In any discussion of the military needs of this country the first thing to be avoided is the formulation of any new or ill-matured suggestions by civilians who have no special knowledge on the subject. Constant change and lack of continuity have been characteristic faults from which our military policy has suffered since the beginning of our national history.

As a matter of fact there is already in existence a carefully matured plan for our national defense, which has been evolved and promulgated by the best military minds of the country. Some 14 years ago, when he was Secretary of War, ELIHU ROOT laid the foundation for the creation of such a policy in the establishment of the General Staff of the Army and the Army War College. After some 10 years of study and preparation, during which the ideas and criticisms of every officer of the Army were sought, there was published during the summer of 1912 a "Report on the Organization of the Land Forces of the United States."

This report is supposed to cover the relations between our land and naval forces, between the forces at home and in foreign service, the relation between the regulars and the citizen soldiery, the peace and war administration of all classes of units, the problems of the mobile army and of the coast defense, methods of enlistment, service with the colors and in the reserve; in fact, all of the matters which should enter into this broad subject and of which many are now being discussed for the first time by the public at large. This report represents the best plan that the best-trained military minds of this country have been able to give to us after careful study and preparation. The manifest duty of the hour is not to supersede or replace it with some undigested proposition put out by less competent men in the excitement of the hour, but rather to ascertain the various respects in which our actual condition at present falls short of the plan and policy thus promulgated and to concentrate all our efforts toward bringing up these deficiencies.

In rough figures, we are spending now about $100,000,000 per annum on our Army and about $140,000,000 on our Navy. Practically, all authorities agree that this amount of money, if wisely spent, would be amply sufficient for the maintenance of a most adequate system of military and naval defense. The real question before the country is not to spend more money upon our forces, but to spend more wisely and economically that which we do spend. For example, under a wise military policy the Republic of Switzerland, by a yearly expenditure of six and one-half millions, has been able to prepare and train an army of nearly 300,000 men, which it was able to call out this summer for the successful protection of her borders against the calamity which befell Belgium. We, under a less wise system, have been spending about $100,000,000 a year on an army whose total strength is only about 90,000, and of which army only 30,000 are available to-day within the United States for the general purposes of a mobile army. There are many facts which differentiate our condition from that of Switzerland; there are many reasons why we can not maintain an army as cheaply as she can, but there is no possible manner of doubt that under proper methods we can come much nearer to her example than we do. The practical question which lies before the American public to-day is simply this: Why should we not spend this large sum of $240,000,000 per year so as to produce the most efficient result possible rather than a result which is admittedly inefficient?

The Army and Navy are peculiar sufferers from our "pork-barrel" system, which is the result of our lack of any national executive budget. So long as the men who are responsible for the efficiency of these two services as a whole—the Secretaries of War and of the Navy—have no hand in the preparation of a budget and no voice to defend such a budget on the floor of the Houses of Congress, while the men who wish to spend the Army and Navy appropriations upon unnecessary Army posts or unfit navy yards have such a voice as well as a vote, a great degree of waste and extravagance is sure to result. Our military system can never be made highly or permanently efficient until a budget system is adopted in this country similar to that which exists in substantially all other civilized countries. This general governmental need is the first need of our Army and Navy.

Roughly stated, our national defensive needs, as discussed in the above-enumerated report of the General Staff, and as agreed to by all competent military and naval authorities, are comprised under the following heads:

First. An adequate and efficient Navy as the primary line of defense.

Second. An adequate system of coast defense to prevent the naval bombardment of our principal seaports and cities.

Third. A small but highly efficient Regular Army to serve in time of peace as a protection against civil disorder; in time of war as a temporary protection against invasion; and in times of both peace and war to be a pattern and nucleus for the organization of the larger citizens' army upon which, in any serious conflict, our protection must ultimately depend.

Fourth. A citizens' army composed of men who do not make arms their vocation, but who have been willing to spend a short portion of their lives in undergoing the training which modern methods of war make absolutely necessary as a condition of usefulness on the battle field.

A very brief discussion of the deficiencies of each one of these four classes and the need of immediate steps to remedy it is all that can be brought within the scope of this report.

THE NAVY.

In our need of an adequate and efficient Navy the United States comes second only to Great Britain. We have 21,000 miles of coast line and a rapidly increasing commerce to defend. The general purpose of a navy is purely defensive, although tactically it must always be able to act on the offensive for the purpose of making effective defense of the country. Standing by itself, a navy is not designed for military aggression, such as the invasion of another country. Its function, on the contrary, is to defend our own country and our commerce against such aggression. Yet, in order to do this, it must be able to seek the enemy's fleet and attack it wherever the conditions for American success are most certain. To scatter the fleet or to tie it down to operations near our own coast is to destroy its real defensive ability. In the Napoleonic wars England was saved from invasion by victories

of her fleet which took place hundreds of miles away from her coasts, and a policy which would prevent our own fleet from adopting such a course of operation would be hazardous to our safety.

These considerations, in addition to the fact that we have distant foreign possessions, require that we should have a seagoing navy of adequate size and efficiency. The many vital questions which are still unsettled in naval tactics require that we should have a navy which is up-to-date in all of the various branches of the service.

As a matter of fact, naval authorities to-day agree that not only has our Navy been falling behind in its general relative strength to that of other nations, but it is strikingly deficient in certain vital particulars. It is extremely short in personnel; it is deficient in the number of our capital ships; it has no battle cruisers and practically no scout cruisers; it is extremely lacking in effective submarines and destroyers.

In view of the fact that the Navy is practically our only existing defense to-day, its needs should meet with the promptest and most earnest attention.

COAST DEFENSE.

Our system of coast defense is in the best relative condition of any of our land defenses. But its function is very limited. Its purpose is merely to protect our seacoast cities from a naval raid and damage such as recently befell Scarborough and Hartlepool. It offers no defense against an enemy who has control of the sea and can land an army at any unprotected point of our huge coast line.

Even in our coast defense there are great deficiencies. Our military policy contemplates that its personnel should be supplied half from the Regular Army and half from the militia. Substantially 50 per cent of each of those two quotas is lacking, and in the case of a sudden emergency, against which it is the purpose of the coast defense to be a protection, many of our forts would be hopelessly undermanned. The amount of ammunition is deficient. The plans of our military advisers contemplate only sufficient ammunition for an hour's firing. The actual supply at present is very considerably behind even that most modest standard, and in many cases our most important seacoast guns would be sufficient for only 30 or 40 minutes' firing.

THE MOBILE REGULAR ARMY.

The report of the General Staff above referred to estimated the size of the mobile Regular Army which it deemed necessary for the defense of the continental United States at about 110,000 men, to be composed in part of men serving with the colors in times of peace and in part of reservists to be called to the colors in time of war.

The Secretary of War reported last November that, excluding the troops in our foreign possessions and in our coast defenses and on various noncombatant and detached duty, our mobile Regular Army consisted of 29,405 men and 1,495 officers, an aggregate of less than 31,000. This number must be still further depleted in order to complete the garrisons of Hawaii and Panama. When those are finished our mobile army within the United States will consist of less than 25,000, a force but little more than twice the size of the police force of New York City. Under the present imperfect reserve law it has a reserve of just 16 men. The mere statement of these figures is sufficient to indicate the gravity of the situation. The Secretary of War asks:

First. For the immediate increase of 25,000 men in the mobile army, to be obtained by raising the present organizations within the United States to their full strength.

Secondly. He asks for the institution of a practical reserve system by which an additional number of reservists for the Regular Army will be eventually obtainable. He also asks for an increase in the number of officers to take the place, in time of peace, of such officers as are serving with the militia or on detached duty with educational institutions and in time of war to assist in the organization of the citizens' army.

The necessity of these very moderate requests is self-evident; in fact they do not go far enough to meet the demand of the situation. Yet the House of Representatives, under the control of the same party as the Secretary of War who has made the request, has completely ignored each and every one of them and the pending appropriation bill contains no provision for even these slight increases.

THE CITIZENS' ARMY.

It has been the historic policy of this country to depend upon a volunteer army of citizens, called out at the outbreak of war, to defend it in case of any serious conflict. The development of the art of war during the last half century has been such as to make radical changes in this policy necessary if it is to be successful. Hitherto we have relied upon training and equipping our volunteers after the outbreak of war. In our previous wars we have escaped disaster under this method largely on account of conditions which will in all probability never occur again. In the Civil War we were fighting against an enemy who was as unprepared as ourselves. Each side trained the other as the conflict proceeded. In the War of 1812 we were fighting a nation which was almost wholly absorbed in a great European war and which spent very little attention upon us. Yet in that war we called out, from first to last, 527,000 men to defend us against an enemy which never had a force of 16,000 men in the field at any one time, and whose total forces throughout the war aggregated only about 54,000 altogether. We were defeated in most of our battles and we lost our Capitol at Washington after a force of 5,400 untrained Americans had run away from less than 1,500 British on suffering a loss of only 8 killed.

We can safely assume that any serious antagonist whom we shall have in the future will not be unprepared. Modern war is fought with weapons which require time to construct and training to use to an extent hitherto unknown. Our citizens to-day are wholly unaccustomed to the use of the military rifle, let alone the modern field piece. The training, equipment, and discipline of the modern army is much more complicated than that of 50 years ago and requires very much greater time and expert knowledge. The conditions surrounding the raising and equipment of a force of citizen soldiery have therefore completely changed since the Civil War. To attempt to organize such a force of volunteers in the way in which we did it then would be to invite disaster against practically any army of modern Europe.

In order, therefore, to be able to depend upon citizen soldiery it is clear that much more time must be spent in preliminary training and in providing for their equipment in time of peace. To-day there is no other force of citizen soldiery within the United States than our National Guard, comprising the Organized Militia of the country. On paper this force consists of 127,000 men, but certainly not more than half of it is even moderately well trained. It labors under the disadvantage of being a State force whose officers are commissioned by the State authorities and whose main support and training come from the States. Under legislation which has been proposed in Congress, but not yet enacted, this force could, at considerable further expense, be somewhat improved in efficiency, but not substantially so or enough to make it a very much more reliable dependence than it is at present.

Under these circumstances it is inevitable that new and broader foundations must be laid for the creation of a body of citizen soldiery in time of war; provision must be made for the training of a force of reserve officers to constitute the junior officers of such a force. Steps have already been taken by the War Department in the institution of summer camps, where young school and college graduates can, in association with the Regular Army, get a brief intensive training. We believe that this should be supplemented by legislation permitting the graduates of such camps to obtain temporary commissions as junior officers in the Regular Army on condition of becoming thereafter reserve officers, subject to call in time of war.

Provision should also be made for general training in rifle shooting among our young men both in schools and in colleges. To this end we call attention to the steps which have already been taken in Switzerland and Australia—two of the most advanced and liberal Governments of the world—where, from early boyhood, their young men are trained to use the rifle as a necessary part of their education. In these two countries, representing in their respective ways the most advanced types of modern democracy and going hand in hand with their freedom of thought and liberalism, we find the doctrine that every man owes to his country not only to die for her, if necessary, but also to spend a little of his life in learning how to die for her effectively. We believe that the institution of a somewhat similar system in this country is not only highly important with a view to its defense in the time of war, but we believe that the necessary self-control and discipline which is inherent to such training would be highly conducive to the moral, mental, and physical betterment of our youth in time of peace.

WAR MATERIAL.

Finally, we find that there is a great shortage in the material in this country necessary to equip a citizens' army for war, particularly in the vital element of field artillery and field artillery ammunition. Such equipment can not be extemporized, nor can it always be purchased after war breaks out. It takes at least five months for the manufacture of a modern battery of field guns within the United States. At present we have in stock but little more than half the necessary number of field guns to equip a citizens' army of the minimum size believed by our military advisers to be necessary; and we have ammunition sufficient to serve those guns, at the rate ammunition is now used, rather less than one day and a half of fighting. We are very insufficient in aeroplanes, being outranked by at least 13 other nations. Immediate steps should be taken to bring up these shortages.

Taken as a whole, we find that the condition of military unpreparedness of the United States is most serious and lamentable. We believe it is the duty of our citizens, without respect to party, to take the present occasion, when the interest of the country has been aroused by the European war, for insisting that Congress give to the subject its most earnest attention, to the end that the foregoing deficiencies may be speedily remedied.

Mr. CALDER offered the following resolutions, which were unanimously adopted:

"Whereas it now seems wise to recur to and heed that specific provision of the Constitution of the United States which places upon the Congress the obligation of providing for the national defense: Now, therefore, be it

"*Resolved*, That we reaffirm the resolution passed by this club on January 17, 1910, as follows:

"'That the Republican Club of New York reaffirms its support of the broad American policy of an adequate national defense.'

"*Resolved*, That this being a highly patriotic and nonpartisan question affecting the preservation and perpetuation of our national life and institutions, we earnestly solicit the cooperation of all political parties and organizations believing with us that the insurance of our nationality is of vital importance to every American along with a safe peace policy.

"*Resolved*, That we approve and adopt the foregoing report and resolutions and that we urge upon the Congress the immediate examination and consideration of the military needs of the United States, to be followed by such legislation as the facts may warrant."

General Prosperity.

EXTENSION OF REMARKS

OF

HON. A. W. LAFFERTY,

OF OREGON,

IN THE HOUSE OF REPRESENTATIVES,

Saturday, February 27, 1915.

Mr. LAFFERTY. Mr. Speaker, when the people pick up any average citizen and place him in Congress for four years he ought to learn something; and if he does learn anything, he should give the benefit of it to the people who elected him.

I have now served in this House four years. During that time Congress has been in session almost continuously. Six sessions have been held, whereas only four sessions are usually held in as many years. So that, as a matter of fact, my incumbency has equaled six years of service under ordinary circumstances.

General prosperity is undoubtedly the one big and overshadowing issue which will throughout the ages most interest the voters at the polls. That party under whose administration the country enjoys the greatest amount of prosperity will always have the strongest claim upon the electorate at the ballot box. As a people and as individuals we are reached by conditions more than by argument or theory.

Yet argument and theory undoubtedly have an important and legitimate function to perform, and, in spite of the fact that conditions have of late actually grown worse instead of better, I wish to give a few reasons why the people as a whole should not give up the fight they have undertaken to bring about in the United States—greater equality of permanent opportunity.

In the first place, with the light that I have as the result of my four years' experience here, it appears to me as clear as the sun on a bright summer day that the only "prosperity" that is now offered to us as a consideration for returning to standpatism would be but temporary, and would turn to ashes upon our lips. In the past 50 years Big Business—that is to say, 200,000 men—two-tenths of 1 per cent of our population—has acquired 70 per cent of our total wealth, leaving but 30 cents on the dollar for the remaining 99,800,000 people. Big Business now says to us, "Let us go back to our old ways; permit us to issue all the watered stocks and bonds for you to pay interest and dividends on that we choose, and allow us to acquire the remaining 30 per cent of the wealth of the United States, thus reducing the American people to absolute and permanent slavery, and we will give you a 'full dinner pail' in the meantime—'we will employ labor.'"

Big Business is now chuckling to itself under the belief that with the "bread-and-butter argument," otherwise called by it the "belly argument," it has coerced the American people into complete submission to its will. It is confident of the next Congress and the next President. It is now casting about for a "safe" candidate to put up against Wilson, and it expects confidently to enjoy four years more of plunder without let or hindrance from the authorized Government of the United States.

The efforts put forth by President Wilson and his Democratic Congress to give equality of opportunity to the citizens of this country have been feeble enough; but even so, the present administration has done more in two years for the permanent good of the people as a whole than has ever been accomplished by any previous administration since the inauguration of Washington. If Mr. Wilson and his party in Congress stand firm for the people under the present onslaught, all good citizens, regardless of party, should support them in so doing. But if their lines waver, or if they unconditionally surrender, as they show signs of doing at the present time, then they should be superseded by a President and a Congress that has both convictions and the courage to stand by them under fire.

No battle was ever won without a fight. The deputy sheriff who would go out and attempt to take a train robber into custody through fine phrases would be marked as a ninny. Yet it would be just as reasonable to expect the men who have robbed the people of the United States through watered stocks and dishonest manipulation of credit to gracefully surrender to fine phrases as it would be to expect the train robber to do so. The only way to deal with the train robber is to put a "44" to his face and tell him he is a prisoner, and the only way to deal with the industrial and financial robbers of the United States is to lay down the law before them and say to them, "Obey this law or go to the penitentiary."

"Oh," but they say, "we have already had too much agitation. Give us a rest." That thought is as old as the first fugitive from justice. But let us look calmly and judicially at existing conditions, which Big Business says should not be disturbed.

The group of 200,000 men heretofore mentioned who own 70 per cent of the wealth of the United States now own everything in this country that is producing any profits to speak of. They own the railroads, the street railways, the gas, electric light and telephone systems, the steamship lines, the big iron, oil, and coal fields, the big steel, woolen, and cotton mills, and they own the big banks.

The railroads alone collect annually from the people of the United States $3,057,000,000, which is $30.57 for each man, woman, and child, or $152.85 for each family of five. The average family income is only $625, even during the "good times" of 10 years ago, so that under the most favorable conditions each head of a family is now working more than one day a week for the steam railroad. The steam railroads are capitalized for $20,000,000,000, when their actual physical value is not more than half that amount. But we have to pay freight rates that will yield them returns on a $20,000,000,000 investment. So in the one instance of the railroads alone each family is being robbed yearly of $75.

What has been said of the railroads is true of the telephones, telegraphs, express companies, and the gas and electric light companies. Attempted regulation of the natural monopolies has proved an absolute and unqualified failure, for the reason that the utilities can set up the wail that they are not making enough money to pay interest and dividends on their watered stock and at the same time keep men employed at good wages. In that way these monopolies can throw the country into a panic, or "hard times," whenever the country refuses to give it all the pap it desires. The only possible remedy is public ownership of natural monopolies. Most everyone says public ownership "is coming some day." I favor it right now, so that it will help the present generation.

No better illustration of the vigor with which the vested interests will fight public ownership of natural monopolies could be found than that afforded by the successful fight it recently made against President Wilson's plan to build or purchase Government ships. Vested privilege saw in that measure what it described as "the serpent of public ownership raising its head," and it put forth all the power at its command to kill the bill, and it succeeded. The President was disillusioned. He was shown who the real ruler of the United States is to-day. Let all good citizens hope that the schoolmaster will get out his hickory stick and put on his fighting clothes; and if he does so, every patriot should back him up at the polls, regardless of politics. But if the President meekly surrenders, then true Americans must look elsewhere for a leader.

Public ownership of natural monopolies would bring permanent prosperity to all the people of the United States. Nothing short of it will do so. So long as a few men own all the profit-producing utilities the rest of mankind will work for those few men, because all their earnings at the end of the year will have gone directly or indirectly to those few men. That is exactly the process that is going on now year by year.

Government control of credit is the only other big thing. The group of 200,000 men of whom I spoke a while ago, in addition to owning all the utilities, now controls the credit of the country. The total stock of money in the United States—gold, silver, and paper—is only $35 per capita, or $3,500,000,000. Yet these manipulators of credit have loaned on real estate alone the enormous sum of $8,000,000,000, or nearly three times our total stock of money. How do they do it? By duplicating deposits and loaning the same dollar over and over again.

For illustration, a big trust company in New York will send out to-day $100,000,000 to be loaned on farm lands in Missouri. The farmers who borrow that money put it back into the local banks. The local banks send it to a bank in St. Louis. The St. Louis bank sends it for deposit to a big New York bank. By this process the cash finds its way back to New York inside of six weeks. Then the trust company goes over to the bank in New York and borrows the same money again, putting up its note with certain public-utility bonds and stocks as collateral security, and sends the same $100,000,000 out to Indiana to be again loaned on farm lands. This process is repeated time and time again.

The group of 200,000 men I heretofore mentioned own both the trust companies and the banks in New York. They also own the public utility bonds and stocks which are made the basis for the extension of this credit to the farmers. In that way the owners of the bonds and stocks not only draw interest and dividends on them from the companies issuing the same, but they also draw interest from the farmers for credit loaned to them which is based upon these same bonds and stocks.

Two years ago I proposed a bill for genuine rural credits, which provided that the Government should loan Treasury notes to the farmers upon first mortgages at 3 per cent interest. The passage of a law like that would permit this Government of ours to act as fiscal agent and hold the securities and extend "credit" to the farmers. That is the very thing the 200,000 men who own 70 per cent of our wealth are now doing. Why not let the Government of the United States make that immense yearly profit from "credit."

Mind you it is not gold or any other kind of actual money that is now loaned to the farmers, but it is "credit." Otherwise it would be impossible for $8,000,000,000 to be now borrowed on real estate in the United States when our total stock of money is only $3,500,000,000.

The Treasury notes that my bill provides shall be loaned to the farmers are redeemable in gold at the Treasury on demand. Do you say we can not do that? That is exactly what we are already doing in the case of the regional reserve banks, except that we are loaning to these banks such Treasury notes for one-half of 1 per cent interest, instead of for 3 per cent interest as my bill provides. Of course there is not gold enough in the country to redeem all paper money in circulation now if demanded at the same time, but banking experience shows that it is never all demanded at the same time, and that the gold can be made to work over and over again just as duplicated deposits

are now made to work. In any view of the case, the Government of the United States can hold the securities in its vaults and issue loans based thereon just as well as can any trust company in New York.

By farming out this "credit" graft to the 200,000 men who now own 70 per cent of our wealth, we are simply donating to these men billions in interest each year which should be going into the Treasury of the United States to enrich the average citizen.

On the $8,000,000,000 of "credit money" loaned upon farms and other real estate alone, interest is being collected annually in the sum of $500,000,000. All of that money would be saved to the people of the United States and lost to the 200,000 men who now own 70 per cent of all the wealth of the United States if Congress would pass a genuine real estate credit bill. And do you realize how much money $500,000,000 is? It would build and fortify the Panama Canal and leave remaining $100,000,000. It would build two trunk lines of railroad each year from the Atlantic to the Pacific, 6,000 miles, costing $80,000 per mile, and leave remaining $40,000,000.

The figures here given are staggering. But they are as true as gospel.

We are simply cringing slaves to the money power. That power owns all press associations and all big newspapers. That power likewise bribes small newspapers when necessary, and hires precinct "workers" in order to defeat any public officer who dares to tell the public the truth.

I believe the country is growing better and stronger every day. I believe the people are going to win. I believe they will win in the congressional and senatorial elections inside of four years and thus actually control their own country. Then we will have a permanent prosperity in the United States heretofore unknown in any country that has ever existed. Until then, we shall be kicked and cuffed about as the slaves that we are. Some of us will kick back.

A nation is not always on the road to permanent prosperity when it appears to be prosperous, and it is not always going backward when things look blue. For example, London now appears to be much more prosperous than New York. But it is a fictitious prosperity that is tying a millstone to the necks of generations yet unborn. England is spending millions daily for war purposes and is piling up its bonded indebtedness. Everybody is "employed at good wages." Even the theaters of London report the best business for years.

Do we want that kind of "prosperity"? Big Business says to us: "Permit us to forge the chains of slavery for your children and your children's children by issuing watered stocks and bonds to our heart's content and we will 'employ labor.'" A ravaging war which would compel us to issue billions of dollars of bonds to be paid off in the sweat of the brow of posterity would give us identically the same kind of "prosperity." To hell with such prosperity! I prefer to go hungry a little while longer, as I have done more than once since my salary stopped three months ago, because it had been drawn against to pay for Government printing.

Then Big Business says that genuine rural credits furnished by the Government itself would be a "wildcat" system. Yet Big Business now has loaned out eight times as much money as there is in existence in the United States. When it comes to banking, Big Business is simply giving us a continual performance of tight-rope walking, holding in its hands a balancing pole with "deposits" on one end and "loans and discounts" on the other. And whenever the people get a little uneasy, and a run of depositors is made calling for what is coming to them from their end of the pole, Big Business rushes to Washington to get Uncle Sam to come to the rescue by furnishing ready funds to meet the situation. This is the same Big Business bully who says if Uncle Sam should get any of the profits out of loaning credit it would be a "wildcat" system. The truth is that Uncle Sam could run a safe system, while the present system of Big Business is a "wildcat" system.

At the end of four years, as I think it all over, and contemplate how I entered Congress with a little money and a little reputation, how I have tried faithfully to serve my constituents when it would have been easy and profitable to have followed the beaten paths of subserviency to Big Business, and how my constituents kicked me in the stomach the second chance they got; I wonder why they put it off for the second chance. But seriously, if I were not feeling grateful to my constituents and confident of the future, I should not indulge in any good-natured pleasantries at this time. To have come as nearly being reelected as I did, without a paper and without a party, convinces me absolutely that I am on the right track, and that a majority of the people will stand by me when they know the facts.

Mining Experiment and Mine Safety Stations.

EXTENSION OF REMARKS

OF

HON. EDWARD T. TAYLOR,

OF COLORADO,

IN THE HOUSE OF REPRESENTATIVES,

Monday, February 1, 1915.

Mr. TAYLOR of Colorado. Mr. Speaker, the passage of this mining experiment station bill (H. R. 15869) is one of the greatest steps ever taken by Congress toward the development of the mining industry of this country. This is one bill that will receive the universal approbation of the entire population of the West and of all of the coal-mining regions of the East, North, and South. It is a measure fraught with tremendous possibilities for good in protecting the lives of our miners throughout the length and breadth of the Nation and in the conservation of the mineral wealth of our country, and every Member of this House will always look back with satisfaction to his part in bringing about this splendid piece of legislation. Personally, I can not express the pride and gratification that I feel over the passage of this bill to-day. And I feel that to the little city of Silverton, in the San Juan mining district of southwestern Colorado, is due more credit than any other city or association or State in this country for the consummation of this legislation.

Some five or six years ago the mining men of that district took up the question of inducing the Government of the United States to establish one or more metalliferous mining experiment stations, somewhat along the same lines that the Government is doing regarding agricultural experiment stations; and the Silverton Commercial Club prepared an elaborate statement, very forcibly showing the necessity of this kind of legislation. As a Representative of our State from western Colorado, they asked me to take the matter up in Congress, and, at their insistence, on June 9, 1911, I introduced, I think, the first bill ever introduced in this House—H. R. 11414—providing for the establishment of a metallurgical mining experiment station at Silverton, in San Juan County, Colo. On December 8, 1911, and January 11, 1912, the Mines and Mining Committee held elaborate hearings upon that bill, and after those hearings the committee authorized me to reintroduce the bill in an amended form as H. R. 22081, and to make a favorable and unanimous report thereon to this House, which I did on April 17, 1912—Report No. 567. My report sets forth so fully the necessity for and benefits of this measure, in so far as it applies to metalliferous mining, that I will quote from it at some length, as follows:

This bill is a substitute for H. R. 11414, which was introduced for identically the same purpose. On the latter bill the committee held very full hearings and investigation, and its report of the hearings of December 18, 1911, describes very fully the objects of the measure and the necessity for an experiment station at Silverton.

The bill is introduced at the request of the Colorado Legislature and of the mining men of that State. The eighteenth general assembly of that State passed a joint memorial to Congress, which was duly signed by the governor on March 7, 1911, and certified and transmitted by the secretary of state. The memorial is quite complete and concise, and is as follows:

[S. J. M. No. 46, by Senator Joyce.]

"To the President and Congress of the United States,
"Washington, D. C.:

"We, your memorialists, the Eighteenth General Assembly of the State of Colorado, do respectfully represent:

"That the mining industry of Colorado, including the mining and the reduction to pure metal of the gold, silver, lead, copper, zinc, and tungsten bearing ores, is of vital importance to the welfare of this Commonwealth, and is of very great importance to the prosperity of our Nation at large; and that this industry furnishes employment to thousands of workmen, provides a market for the products of factory and farm, supplies gold and silver for the mints, and produces the industrial metals now indispensable to the progress of the many industries of our country;

"That in mining, as in agriculture, from the very nature of the enterprise, there is and can be but very little cooperation in solving the problems of the industry; and that under the existing conditions a very large percentage of the metals contained in the crude ore, especially in the lead, zinc, and copper bearing ores, is lost in the course of milling or is sacrificed in attempting to ship the low-grade ore to distant smelters and in smelting that ore containing a high proportion of silica or other refractory and useless material; that the heavy percentage of loss of these metals experienced by the miners under existing methods of milling and ore dressing not only injuriously affects the mining industry itself but constitutes a substantial and irretrievable loss out of the natural resources of our Nation; and the conservation of the metal wealth of our country must be accomplished not by preventing the use of that metal but by preventing its loss and waste;

"That the Department of Agriculture of the United States has fully proven the efficiency of local or field experiment stations in solving the many problems of the farming industry, and there is every reason to believe that similar good results may be achieved by the same system in solving the problems of the mining industry;

"That the San Juan mining region of Colorado, covering as it does a broad expanse of mineral territory, and including almost every

known combination of gold, silver, lead, copper, zinc, iron, and tungsten bearing ores, as well as vanadium, uranium, and other rare metals, and holding large deposits of low-grade refractory ores, is a most favorable place for the location of a Government mining experiment station:

"Therefore we, your memorialists, do respectfully and earnestly request and petition that the National Bureau of Mines and Mining may be allowed such funds as may be necessary for that purpose and may be authorized and empowered to establish and maintain at Silverton, in the center of the San Juan mineral territory, a local mining experiment station, to be conducted under the charge of skilled chemists and metallurgists, and at which all metalliferous ores may be analyzed, and at which all known processes of ore treatment may be applied, tested, and compared, and at which new methods and processes may be developed and perfected—all to the end of improving the methods and conditions of the mining industry and saving from waste and conserving the metal resources of our country."

The Colorado Mining and Metallurgical Association has also memorialized Congress upon this subject, and sent to the committee resolutions which are as follows:

"Whereas the mining industry of Colorado, including the mining and the reduction to pure metal of the gold, silver, lead, copper, zinc, and tungsten bearing ores, is of vital importance to the welfare of this Commonwealth and is of very great importance to the prosperity of our Nation at large, and this industry furnishes employment to thousands of workmen, provides a market for the products of factory and farm, supplies gold and silver for the mints, and produces the industrial metals now indispensable to the progress of the many industries of our country;

"Whereas in mining, as in agriculture, from the very nature of the enterprise, there is and can be but very little cooperation in solving the problems of the industry, and under the existing conditions a very large percentage of the metals contained in the crude ore, especially in the lead, zinc, and copper bearing ores, is lost in the course of milling or is sacrificed in attempting to ship the low-grade ore to distant smelters, and in smelting that ore containing a high proportion of silica or other refractory and useless material the heavy percentage of loss of these metals experienced by the miners under existing methods of milling and ore dressing not only injuriously affects the mining industry itself, but constitutes a substantial and irretrievable loss out of the mineral resources of our Nation, and the conservation of the metal wealth of our country must be accomplished not by preventing the use of that metal but by preventing its loss and waste;

"Whereas the Department of Agriculture of the United States has fully proved the efficiency of local or field experimental stations in solving the many problems of the farming industry, and there is every reason to believe that similar good results may be achieved by the same system in solving the problems of the mining industry;

"Whereas the San Juan mining region of Colorado, covering, as it does, a broad expanse of mineral territory and including almost every known combination of gold, silver, lead, copper, zinc, iron, tungsten, and other mineral-bearing ores, as well as vanadium, uranium, and other rare metals, and holding large deposits of low-grade refractory ores, is a most favorable place for the location of a Government mining experiment station;

"Whereas the Secretary of the Interior, Walter L. Fisher, has recommended an appropriation of $100,000 by the National Congress to be used in experimental metallurgical work; and

"Whereas the Hon. EDWARD T. TAYLOR, Congressman from Colorado, has introduced a bill in the lower House of Congress calling for an appropriation of $35,000 for the construction and maintenance of an experimental metallurgical plant in Colorado: Therefore be it

"*Resolved*, That we respectfully and earnestly request and petition that the national Bureau of Mines and Mining may be allowed such funds as may be necessary for that purpose, and may be authorized and empowered to establish and maintain at Silverton, in the center of the San Juan mineral territory, a local mining experiment station, to be conducted under the charge of skilled chemists and metallurgists and at which all metalliferous ores may be analyzed and at which all known processes of ore treatment may be applied, tested, and compared, and at which new methods and processes may be developed and perfected; all to the end of improving the methods and conditions of the mining industry and saving from waste and conserving the metal resources of our country."

The Denver Chamber of Commerce and the Colorado Chapter of the American Mining Congress have also memorialized Congress upon this subject, as follows:

"Whereas increased activity of Colorado's metalliferous mining industry will correspondingly benefit all other industries and lines of business in the State and ephance the value of all real estate, urban and rural; and

"Whereas metallurgy in Colorado has made great strides in recent years, rendering profitable a vast tonnage of medium and low-grade ore not previously available; and

"Whereas there yet remains many millions of tons of medium and low-grade complex ore carrying five or more metals, the profitable mining and treatment of which ore involves the saving of practically all the metallic contents, a problem not yet solved, notwithstanding very large sums of private capital have been expended thereon; and

"Whereas the conservation of the mineral resources of Colorado and other States calls for new methods whereby the aforesaid classes of complex ores can be profitably treated by the saving of practically all the various metals therein instead of, as at present, involving loss; and

"Whereas the agricultural experiment stations, for many years conducted by the United States Department of Agriculture, have been of untold benefit to the agricultural industry in particular and to the Nation at large; and

"Whereas metallurgical experiment stations, under the management of the United States Bureau of Mines, will be of untold benefit to the metalliferous mining industry in particular and to the Nation at large; and

"Whereas, in view of the importance of the subject to Colorado, it is most desirable that the Colorado Chapter of the American Mining Congress should have the heartiest cooperation and support of the Denver Chamber of Commerce and all other commercial organizations of Colorado in securing metallurgical experiment stations in Colorado:

"*Resolved*, That this meeting of members of the Colorado Chapter of the American Mining Congress, the Denver Chamber of Commerce, and others, indorses the action of the American Mining Congress as embodied in the resolution adopted at the annual session of the Congress held at Chicago in October last, calling upon the United States Congress for the establishment of metallurgical experiment stations.

"*Resolved further*, That this meeting pledges itself to support the officers and directors of the American Mining Congress in their efforts to secure an adequate appropriation by the United States Congress for the establishment of such metallurgical experiment stations."

The American Mining Congress, which is composed of the most able and representative mining men of the West, at its recent annual meeting in the city of Chicago unanimously passed the following resolution:

"Whereas the development of processes of ore treatment capable of handling with profit the vast low-grade deposits and mine dumps of our mining districts is of the greatest importance to the mining industry and to all related industries: Be it

"*Resolved*, That it be the sense of the American Mining Congress that the Congress of the United States be, and is hereby, memorialized to provide for the establishment, under the direction of the Bureau of Mines, of a metallurgical experiment ore-testing station or stations for the purpose of devising methods for the extraction of metals from low-grade ores and appropriate sufficient funds for such purpose.

"*Resolved further*, That the officers of the American Mining Congress draft a suitable bill providing for the proper carrying out of this resolution, and that copies of the bill and of this resolution be forwarded to the President of the United States and each Senator and Representative; and that the officers of the American Mining Congress use all honorable means to the end that such a bill may become a law, in view of the increasing importance and complexity of the mining and metallurgical industries, the deplorable waste in mining under present methods, and the great need of trained men to aid in improving these conditions and in developing greater safety and efficiency.

"*Be it resolved*, That the American Mining Congress, now in session at Chicago, urges the Congress of the United States at Washington to provide for aid and cooperation in the maintenance of mining schools in the several States in a manner analogous to that which has been done in behalf of agriculture.

"*Be it resolved*, That the members of the American Mining Congress and the friends of the mining industry throughout the country are hereby urged to cooperate in securing the proper legislation necessary to carry above purpose into effect."

There are many other organizations of business men throughout the West that are and have for some years past been very urgently appealing to Congress for relief in the manner provided by this bill. It should be remembered that while the National Bureau of Mines is doing a splendid work in its limited field and in a limited way, yet its energies are thus far practically entirely devoted to coal-mining industries. There has been no recognition thus far of the metalliferous mining industries of the West, and it is believed that that industry is entitled to consideration by the Government.

This bill was referred to the Department of the Interior for consideration, and the report of the Secretary of the Interior thereon is as follows:

"DEPARTMENT OF THE INTERIOR,
"*Washington, April 1, 1912.*

"Hon. MARTIN D. FOSTER,
"*Chairman Committee on Mines and Mining,*
"*House of Representatives.*

"DEAR SIR: Replying to your letter of March 21, asking for my opinion on House bills 22080, 22081, and 22088, relative to the establishment of mining experiment stations in the States of California, Colorado, and Utah:

"The purpose of these bills is to provide for 'inquiries and scientific investigations concerning the mining, preparation, treatment, and utilization of ores and other mineral substances, with a view to improving health conditions, increasing safety, efficiency, economic development, and the prevention of waste in the mining, quarrying, metallurgical, and other mineral industries, and as will facilitate the proper and efficient development of the resources of the public domain.'

"This purpose and the main features of these bills meet with my approval.

"Such investigations will be helpful in the development of mining on the public lands of each of the States, both within and without the national forest reserves; and the necessary expenditures for conducting these investigations will be justified more than under ordinary conditions, for the reason that in these States the Government is itself largely interested in any and all investigations looking to the proper development of the mining and metallurgical industries.

"I believe, however, that in each of these bills, instead of locating specifically in each State just where the experiment station is to be established, it would be wiser to leave the question of specific location to the department, so that the investigations might be conducted from time to time at whatever point there proved to be most need of investigations and where the investigations might be carried on under the most favorable conditions. Indeed, a movable location for each station might enable the department to carry out the purposes of these bills with greater economy and efficiency than could be done under any other plan.

"Under the provisions of these bills there can be no possible conflict of interests between the investigations for which they provide and the work of private mining and metallurgical engineers and chemists.

"Very respectfully,

"WALTER L. FISHER, *Secretary.*"

The report of the Secretary, as will be observed from the above, is favorable. There is a suggestion that it would be wiser to leave the question of the specific location of the station to the Department of the Interior, rather than fixing it at any particular place. The reason your committee has not followed that suggestion is because it is believed that when the entire State of Colorado, acting officially through its legislature, has specifically designated a certain place, which is approved by various mining organizations and mining men, the judgment and wishes of the State should be considered in that respect.

It was fully shown at the hearings that the city of Silverton is in the center of what is known as the San Juan country, and it is surrounded by a mining region and a broad expanse of 3,000 square miles of mineral territory that has produced a very large amount of ore and a great amount of wealth to this country; and they say that in the immediate vicinity of that mining town there is practically every known combination of gold, silver, lead, copper, zinc, iron, tungsten, and other mineral-bearing ores, and that the most of it is what is known as low-

grade refractory ores—that is, ore which is difficult to treat. There are very large deposits and a great variety of it there, and the mining interests of the State have felt that there ought to be an experimental mining station placed there, in charge of skilled chemists and metallurgists, for the purpose of not only analyzing and testing those ores, but to devise, if possible, new means and processes of treatment—means and methods of aiding the mining industry and saving from waste and conserving the metal resources of the country and making the very valuable mineral substances in this region available for the use and general welfare of the Nation.

The State legislature and many of Colorado's mining men feel that the city of Silverton is the most advantageous place in that whole country for a local experimental station. There the ores are immediately adjacent and available; and our mining men are confident that if an experimental station can solve the problem of economically treating the various kinds of ores that are found at and near Silverton the information will cover practically the entire United States; that there are, comparatively speaking, no ores or mineral substances anywhere but what can be handled if the ores of that locality, including the southwestern part of Colorado, can be treated. As this official memorial says, there are as high as five different kinds of valuable substances in one body of rock that they take out.

On behalf of the mining industry of the West it was shown to your committee that the welfare of this Nation is very much dependent upon and affected by the conservation and economical production and treatment of the metals of the Western States; that the gold and silver, copper and lead, zinc and iron, vanadium and uranium, and other rare metals that are produced in the Rocky Mountain region are really the lifeblood of the business of this country and the basis of our prosperity. That the metalliferous mining industry is being neglected and has been neglected, and that metalliferous mining at the present time is at a comparatively low ebb. It is believed by your committee that if the Government could assist in evolving processes of handling low-grade ores—that is, ores running below $10 per ton—thousands of mines would be opened and the wealth of the world would be added to by many hundreds of millions of dollars.

It was shown that there are a large number of valuable substances that can not under the present process be handled at all, and the problem of the rejuvenation and continued prosperity of the mining industry depends upon the establishment of metallurgical experiment stations at which scientific and practical work along that line can be done.

The mining men of the West feel that the Government should take an interest in and assist in finding means of treatment of the low-grade refractory ores and get them into a merchantable condition. That will require experiments, expenditures, and skilled expert knowledge of the highest class. They prefer to have experts on the ground to examine the ores and the metal formations as they exist in nature.

Silverton has a population of over 2,000 people and is a splendid mining camp, located in the center of one of the principal mining and metalliferous portions of the State, and is most advantageously and suitably located for a mining experiment station.

The claims of the city of Silverton are forcibly presented by the commercial club of that city, which has also memoralized Congress in the following manner:

OFFICE OF THE SILVERTON COMMERCIAL CLUB,
Silverton, Colo., May 22, 1911.

Representative EDWARD T. TAYLOR,
Washington, D. C.

DEAR SIR: The Silverton Commercial Club, including in its membership nearly all of the business and mining men of San Juan County, would ask for your personal assistance in the matter of procuring the National Government, through its Bureau of Mines, to establish at once a mining experimental station at Silverton, Colo.

The last General Assembly of the State of Colorado adopted by unanimous vote a joint memorial to the President and Congress, asking the establishment of this station. We inclose a copy of that memorial for your consideration and assistance. It is hardly necessary to call your attention to the importance of the mining industry to Colorado and the Nation at large; but we do desire to emphasize the urgent need for Government aid in solving the problems of this industry. Out of every hundred million dollars' worth of crude ore extracted from the mines in Colorado it is safe to say that from thirty to forty million dollars' worth of the metals are irretrievably lost. In the low-grade mines, which constitute the permanent mining industry, from 30 to 40 per cent of the crude lead, zinc, copper, gold, and silver is lost in the process of ore treatment and reduction. Where the timber of a country is destroyed it may be regrown in a limited number of years; but the metals lost in the process of reduction, returning as they do to earth or river bottom, are lost to our industries for all time.

These problems can be solved only by actual experimentation in the field—at the place where the problems exist. Silverton is situated in the center of the great San Juan mineral district and is undoubtedly the best place in the West for actual tests and experimentation. All kinds and combinations of ore are to be found in abundant quantities. Electric power is cheap and abundant. The coal fields are near by to the south. The town itself, while surrounded by the mines, has every convenience of the modern city and from this point four railways extend to important mining districts; and this San Juan section more than any other part of the West has need of a scientific experimental station. It is a country by itself, broad in extent, capable of great and permanent production of metals, but holding many varieties of refractory ores which try the skill of millman and metallurgist. This place was selected in the memorial of the Colorado General Assembly not only because it most needs the help of the national bureau, but because here the broadest opportunity for successful field work is presented.

We would ask your earnest and personal assistance in procuring the establishment of this mining experimental station. It will require an appropriation by Congress, which ought to be a fund of at least $100,000 to establish and equip the station and $25,000 per year for maintenance and operation. The plant will naturally demand the services of skilled metallurgists, able to do efficient work and employed to give their whole time. And the station should not be limited to narrow bounds of experiment, but should be enabled to procure and test any process and every mechanical device that may save the metals.

And if the National Government, by means of such a limited investment, can substantially increase the saving of the precious and industrial metals, it will not only improve the condition of a great national industry but will accomplish a great conservation of the natural wealth of our country.

We would ask you to give every assistance within your power to procure the introduction and passage of a proper appropriation bill at the present session of Congress, and to prevail upon the National Mining Bureau to establish the station this year.

Very truly, yours,

THE SILVERTON COMMERCIAL CLUB,
By W. N. SEARCY, *President.*
WARREN C. PROSSER, *Secretary.*
B. B. ALLEN.
J. A. MCCUMMON.
JOSIAH WATSON.
A. W. HARRISON.

The nineteenth session of the General Assembly of Colorado again memorialized Congress upon this subject on February 25, 1913, as follows:

SENATE JOINT MEMORIAL NO. 3—MINING EXPERIMENT STATION.

[By Senator Joyce.]

To the President and Congress of the United States, Washington, D. C.:

We, your memorialists, the Nineteenth General Assembly of the State of Colorado, do respectfully represent:

That the Eighteenth General Assembly of the State of Colorado unanimously adopted senate joint memorial No. 46, respectfully requesting the establishment of a mining experiment station at Silverton, San Juan County, Colo.

That in pursuance of the request contained in said memorial, Hon. EDWARD T. TAYLOR, Congressman at large from the State of Colorado, introduced House bill No. 22081, asking for an appropriation to carry out the purposes thereof. That said House bill 22081, after mature and careful consideration by the House Committee on Mines and Mining, was favorably reported, and the same is now on the House Calendar with favorable recommendation.

Now, therefore, we, your memorialists of the Nineteenth General Assembly of the State of Colorado, hereby reaffirm said senate joint memorial No. 46 as adopted by the Eighteenth General Assembly, and respectfully and earnestly urge an early passage of said House bill No. 22081, in order that the aims and purposes thereof may be served as speedily as possible.

Approved February 25, 1913, 8.12 o'clock p. m.

The hearings before the Mines and Mining Committee upon my bill contain several statements and some data that I think are of sufficient importance to warrant insertion in the RECORD, as follows:

The CHAIRMAN. Mr. TAYLOR, we will hear from you on your bill, No. H. R. 11414.

STATEMENT OF HON. EDWARD T. TAYLOR, CONGRESSMAN AT LARGE FROM COLORADO.

Mr. TAYLOR. Mr. Chairman and gentlemen, I might preface my remarks by saying that the Legislature of Colorado last winter passed a joint resolution memorializing Congress to establish a metalliferous mining and metallurgical experiment station in the mining town of Silverton, in southwestern Colorado. I will say that Silverton is in the center of what is known as the San Juan country, and it is surrounded by a mining region and a broad expanse of 3,000 square miles of mineral territory that has produced a very large amount of ore and a great amount of wealth to this country; and they say that in the immediate vicinity of that mining town there is practically every known combination of gold, silver, lead, copper, zinc, iron, tungsten, and other mineral-bearing ores, and that the most of it is what is known as low-grade refractory ores—that is, ore which is difficult to treat. There are very large deposits and a great variety of it there, and the mining interests of the State have felt that there ought to be an experimental mining station placed there, in charge of skilled chemists and metallurgists, for the purpose of not only analyzing and testing those ores, but to devise, if possible new means and processes of treatment—means and methods of aiding the mining industry and saving from waste and conserving the metal resources of the country and making the very valuable mineral substances in this region available for the use and general welfare of the Nation.

With that object in view, the mining interests of the State have prepared, and many organizations in the State have passed, elaborate memorials. I am in receipt of several of them recently. They recite many forcible reasons for the enactment of this bill, and I will insert some of them in the record.

We favor the large appropriations which have made possible the beneficial results that have been secured by the agricultural experiment stations. Those stations have proven wonderfully efficient in solving many problems of the farming industry, and we believe equally good results may be achieved by a similar system in solving many of the problems of the mining industry; and while we join with you gentlemen from these coal-mining States and wish you Godspeed, and will go right along with you in all the commendable work that you are doing in the interest of the coal-mining industry, at the same time we feel that the welfare of this Nation is very much dependent upon and affected by the conservation and the economical production and treatment of the metals of our western country, and that the gold and silver, copper and lead, zinc and iron, vanadium and uranium, and other rare metals that we produce in the Rocky Mountain region are really the lifeblood of the business of this country and the basis of our prosperity, and that it is being neglected and has been neglected, and that mining at the present time is at a comparatively low ebb. There is no use of shutting our eyes to that fact. If the Government could evolve processes of handling low-grade ores—that is, ores running below $10 per ton—thousands of mines would be opened and the wealth of the world would be added to by many hundreds of millions of dollars. We have lost many thousands of miners from the State of Colorado in the last 10 or 15 years because the Smelting Trust and the railroads have very largely consumed the values in our low-grade ores and we have been unable to treat them in a way that would be profitable; and there are a large number of valuable substances we know that can not under present processes be handled at all, and the problem of the continued prosperity and rejuvenation, we might say of the mining industry depends upon the establishment of metallurgical experimental stations, or at least a great deal of scientific work being done along that line.

It may be said that these ores could be shipped to places and possibly to more central places than the town of Silverton. But we have considered all that matter in the State of Colorado, and our State is certainly up among the first, if not at the head, of the metal production, and our legislature, which speaks officially for Colorado, has asked for

the establisment of this experiment station at Silverton, not at the State school of mines at Golden.

The CHAIRMAN. Why is it they do not ask for it at the State school of mines?

Mr. TAYLOR. They feel that the ore has got to be handled in large quantities. There should be a ton of it handled at a time, and they figure that the shipment backward and forward of the ores would be an expense that would possibly eat up all the appropriation. It is true there is only one railroad down into that country, and it is a narrow-gauge railroad. But the mining men, who have most actively taken up this matter, feel that the ore had better be experimented with on the ground where it is produced rather than be shipped a long ways to the station.

It is a question of brains, rather than locality; it is a question of scientific knowledge, examination, and experiment. What we need is expert knowledge, rather than the question of locality. Theoretically, possibly, it does not make so much difference where the ore is treated, but practically we think it can be more intelligently and advantageously handled near where it is found in the state of nature. I am not a mining expert, and I do not pretend to present this matter as lucidly, possibly, as a chemist or metallurgist or mining engineer might do.

While one metalliferous experiment station will not be enough for the entire West, at the same time it would be a start in the right direction, and it would be a very great service to the mining industry. The West—and I may say that I speak for all of the 15 mining States—feel at the present time that we are left out in the cold. We are not being provided for. We have been working for 25 years to get a Bureau of Mines; in fact, we have been working for a Department of Mines.

We felt that the mining industry of this country was entitled to a Cabinet officer, and we have been working to that end for all these years, and we have finally succeeded in getting a Bureau of Mines. That is a very great step, and we have been congratulating ourselves over that. But the Bureau of Mines up to the present time has not given any perceptible, or, at least, any practical attention to the metalliferous mining. It is devoting itself almost entirely to coal mining. The bureau is doing splendid work for the coal-mining industry and we are not objecting to that; but we do feel that it is our turn to begin receiving attention and that we should be put in a position where we can derive some of the benefits of the appropriations that are made for this bureau. Of course, I do not say the bureau has done anything for us, but what I mean is that in the main it is devoting practically its attention, as the appropriations have been made largely for that purpose, if not entirely, to the coal-mining industry. We do not want to detract from that, not a particle; but we do feel that the metalliferous mining of all these Western States should be taken into consideration, and what they want now is some effective means whereby they can add to what private capital has already done in the way of investigating and experimenting with the large number of classes of valuable substances that are deposited in that country.

We want to find means of treating those refractory ores and getting them into merchantable condition. That will require experiment; it requires expenditure; it requires skilled, expert knowledge of the highest class, and that is the knowledge that we need; it is a question of brains and money rather than one of muscle or railroad facilities. We want experts to go into those camps themselves and examine the ores and examine the manner in which they are found in the ground and the topography of the country and ascertain on the ground the best manner of treating the ores found there. We feel that if you put the station away off in New York City or Denver, then the work becomes too theoretical, and that it may get into politics. That is too far off, and we would not have as practical men as we would if we had them right there among those miners and in the camps. We want somebody with practical sense to be on the ground. We are suspicious of theoretical work at long range, and we would rather have it right there where the ore is taken out of the earth and experimented with. Moreover, we are confident that if there are any ores different in any other part of the West, especially in any other part of Colorado, than what they have at Silverton, that those ores can be shipped to Silverton cheaper than all of the numerous kinds of ores at Silverton can be shipped to other places. In other words, that is the center, in our State, of these various kinds of ores and minerals that we want to have treated and processes devised to economically handle them. I am simply presenting to you Colorado's official idea of the matter. If we can not get it at Silverton, the State will be glad to have it at the State school of mines. If we could get an appropriation of a million dollars to build a great central experiment plant, such as we ought to have and the mining industry is entitled to, then it should be located at our school of mines. But we have no present hopes of being able to secure such a plant, and we are now merely asking for the creation of a local field experiment station at Silverton.

"DENVER, *May 22, 1911.*

"Hon. EDWARD T. TAYLOR,
"House of Representatives, Washington, D. C.

"MY DEAR MR. TAYLOR: Your favor of the 16th instant received, and I want to thank you very kindly for the compliment you have paid me, and I want to assure you that I will use all honorable means to promote, so far as it lies in my power to promote, the metalliferous mining in this State during my term in office.

"In my judgment mining is the greatest industry in this State, and there is no other industry that has been so badly neglected as this has been up to the present time. There has not been, so far as I know, one dollar expended by the Federal Government in this State in the way of erecting experimental plants, so that our mine owners and mining men may have some knowledge of what kind of reduction plants are most suitable and adapted to the treatment of the different characters of ore that are mined in certain mining districts in this State.

"Take, for instance, the Cripple Creek, Telluride, and Leadville districts, the problem has been practically solved as to the best methods for the treatment of ores, so that the values may be saved and the best results obtained. If you can secure an appropriation of $350,000 at the next session of Congress, so that two experimental plants can be erected in Colorado, say, one at Golden and one at Silverton, you will be doing the State a great benefit.

"The seventeenth general assembly made an appropriation of $75,000 to erect such a plant at the State school of mines, at Golden, and the eighteenth general assembly made an appropriation of $50,000 more to complete said plant. If you could, as stated before, secure an appropriation of $350,000, so that $200,000 could be added to this Golden plant and $150,000 be used for erecting a smaller plant at Silverton, whereby all the ores from the great San Juan mines could be tested, so that the different mine owners could erect on their properties such a plant as would be recommended by the men in charge of said experimental plants.

"To-day we have nothing but monuments, one after another, of mills strung from one end of the different gulches to the other end, which are absolutely worthless, all on account of the owners not knowing just what kind of a plant to erect that would save values. If you can secure this appropriation and place a first-class metallurgist in charge of said plants, you need not fear but what the Government will get anything but the best results from all moneys which shall be appropriated for the upbuilding of the mining industry. It is necessary, in my judgment, to erect two such experimental plants, as the ores in the San Juan districts vary more than they do in other districts. Take, for instance, the Red Mountain mining district, in Ouray County; their ores contain gold, silver, lead, zinc, copper, and iron; Ice Lake and South Mineral districts, the values are principally gold, silver, and lead; Sultan Mountain district, their values are gold, silver, lead, and copper; Bear Creek mining district, their values are mostly all gold; the Arasta Basin mining district, their values are gold, silver, lead, and zinc; Cunningham Gulch mining district, their values are gold, silver, lead, and copper; Minnie and Maggie Gulches, their values are mostly all gold; Eureka and Animas Forks mining districts, their values are gold, silver, lead, copper, and zinc; Boulder Mountain and Gladstone mining districts, their values are principally gold, copper, and zinc.

"All of the above-mentioned and several other districts are tributary to Silverton. There are four different railroads running into Silverton; all ores can be shipped to this experimental plant at very little cost to the owners. At Silverton they have cheap power and good water, and I am satisfied that the people in that district will secure a first-class location for erecting such a plant free of charge.

"For any further information in regard to the San Juan district, I would refer you to our mutual friend, Senator John T. Joyce, of Silverton. Senator Joyce introduced a resolution in the senate asking for an appropriation along the lines above mentioned, and he will forward you a copy of said resolution. I will do so myself, if I can find a copy of same.

"Very truly, yours,

"T. R. HENAHEN,
"State Commissioner of Mines."

[Silverton Standard, Silverton, Colo., Saturday, Nov. 18, 1911.]

"CONSERVATION AS APPLIED TO MINING AND IMPORTANCE OF FEDERAL INVESTIGATION ABLY EXPOUNDED IN BRILLIANT ADDRESS OF W. N. SEARCY BEFORE RECENT CHICAGO MEETING OF THE AMERICAN MINING CONGRESS.

"The following able address on the question of 'Federal investigation of ore-treatment problems,' delivered by Attorney W. N. Searcy, of this city, at the convention of the American Mining Congress recently held in Chicago, is attracting widespread attention in mining circles and is regarded by those interested in the general promotion of the great mining industry of the Nation as the most clear, logical, and forceful presentation of this most important question ever laid before the Congress for its consideration.

"As it deals with a question in which we are most vitally interested at this particular time, we take pleasure in publishing the address in full for the information and edification of our readers and urge them to carefully read and maturely consider the vital points it covers.

"Mr. Searcy spoke as follows:

"In the first place, it is rather embarrassing to me to undertake to discuss a question of this character which must naturally touch upon some of the technical phases of mining, when I myself am not actively engaged in the actual business of mining. I am interested in mining property. All that I have is invested in the mining country. I represent men who are engaged in mining, and therefore have been selected by some of my friends in Colorado to undertake to tell you a little about this subject. I will ask that you bear with my want of oratorical talent, for I hope that whatever may be lacking in oratory may be made up by the appeal which the plain facts concerning the mineral industry itself must make to your sound judgment.

"If the Federal Government takes hold of this proposition to solve the treatment of ore, it will deal only with general problems; it will undertake only the more intricate and difficult problems, and therefore it will be working not for any one section but for the people of the United States. I take it that this mining congress itself will not take up any sectional issues, and while in undertaking to discuss this subject I shall refer to some sections of the West, perhaps to some sections of Colorado, I wish you to understand, in fairness to this convention, that I refer to those localities only as illustrations, for Illinois and Michigan and Utah and Missouri are interested in this problem in the same way as is Colorado.

"Our president's address as delivered to you this morning goes quite fully into the foundation for asking Federal help in the solution of these questions. He has explained to you very fully the work which has been performed by the agricultural experiment department of the United States. He has shown you how valuable that work has been and the tremendous amount of good that has been accomplished. I will not repeat that part of the argument. What Mr. Dern has presented to you upon that subject should be enough.

"Now, in order to consider whether the Federal Government should undertake to help solve these problems of ore treatment it is necessary first to consider, to a limited extent, the importance of the industry itself. If you will take the 11 States situated west of the eastern Colorado line, you have the distinctively mountain States of our country. If you will add to them the Territory of Alaska, you have what may be called the metal mining section of our country. This is not because Missouri does not produce more zinc than some of those States, not because Michigan does not produce more copper than some of those States, but because in those Western States the mining industry is the basic or foundation industry. Mining in those States and Territories bears the same relation to general industry there that manufatcuring does to general industry in New England or cotton raising to the industry of the South. Furthermore, if it were not for the mining industry existing in large sections of those mountain States their progress would be very materially handicapped and their final development would be greatly limited. I desire to give you a local illustration: There is a section in Colorado known as the San Juan mining district. That territory is formed by the crossing of the great Continental or Rocky Mountain Divide by the San Juan Range of mountains, thus creating a large and very precipitous mountain country. For instance, in my little county there are probably 20 or 25 mountains rising to 13,000 feet elevation, and our engineers tell us

that if the entire county were leveled down it would all stand above the timber line. Silverton, our county seat, has an altitude of 9,000 feet—up so high that summer heat is unknown. Now, that territory itself covers practically 3,000 square miles of country—that is, the mineral section alone is the size of Delaware and Rhode Island combined—and it is rich in lead, copper, zinc, gold, silver, and other metals, but the important thing is that all of that territory would be vacant, all that territory would be idle, all that territory would be practically useless and unoccupied, were it not for the mining industry. That same condition exists in Utah, it exists in Idaho, it exists in all those Western States that I have mentioned, and if the mining industry is not to be protected and preserved we are going to leave a great portion of the western section of the United States practically unoccupied. We can not afford as citizens of the United States to neglect or overlook any possible measure or step which may make that portion of our country populous and prosperous. But that is not even the most important prosperity phase of this subject. While I have mentioned to you a mining district in southwestern Colorado as an illustration which covers 3,000 square miles of mountain territory I wish to state that south of that territory is a farming country which is fertile, well watered, capable of producing almost any product of the Temperate Zone. Now, that farming territory, including therewith the mining section, covers an area of 20,000 square miles and extends into the southwestern part of Utah, the northwestern corner of New Mexico, and it extends far eastward in Colorado. Now, that agricultural territory of 20,000 square miles is equivalent in size to Massachusetts and Connecticut and Delaware and New Jersey combined. It is capable of supporting hundreds of thousands of people. Yet that agricultural territory under present conditions would not know prosperity if it were not for the mining cities up in the mountains which make a market for the agricultural products. I desire to use this illustration to show you by a concrete example the importance to Colorado and to Utah and to Nevada and to Idaho and to every other State of preserving and conserving the interests of the mining industry itself.

"Now, it goes further than that. In the State of Colorado, and, I dare say, in Utah and other Western States, the mining industry forms the basis for the best market that the coal miners themselves know. We have a great deal of coal in that country, as you have here, but it takes the mining industry to stand in the place of your manufacturing and transportation industries of the East.

"Another idea that is worth considering. That western country that I have described, including Alaska, covers nearly one-half the entire area of the United States. Alaska alone is equivalent to five of the largest States you would be likely to name, excluding Texas. That big western section should not be brought into competition with the eastern agricultural sections, when by proper encouragement of the mining industry in that western metal-producing country it will provide its own market and prevent agriculture of the West from competing with and injuring agriculture in the East. Now, this is only a general consideration of the importance of the mining industry in that western section alone. The same considerations apply in a general way to the metal-mining industry in Illinois, in Missouri, in Wisconsin, and other States.

"The metal-mining industry has another phase more important than mere present prosperity for our generation. Something has been said about conservation. Now, I may not agree entirely with the views recently expressed concerning conservation, but I certainly do agree to some extent; and that is to say, the true conservation should be a conservation which saves for the people and not one which denies use to the people.

"This is preeminently the age of metals. It is the age of electricity. It is the age of invention. It is the age of speed. It is the age of machinery. Fifty years ago, if you had been sitting in this hall holding a convention and a neighboring building were being erected, you might have heard the blows of the carpenters' hand hammers. To-day a building is being erected there; and somewhere away off in another part of the city there is situated a tremendous plant, involving tons and hundreds of tons of iron and steel and copper in its construction. From that plant run electric wires, involving more tons of copper, out through the city, until they ramify every street and avenue in the metropolis. One of the wires it attached there on the side of the new building to some kind of an electric machine. The building itself is of steel. The machine that makes the noise is of steel, copper, and iron, and instead of the whack of the old-fashioned hammer you hear the vibrations of the machine hammer riveting beam upon beam and erecting a structure almost wholly composed of metal. Yet the giant steel frame you view from the window is merely an ordinary business building of this day. That building is only an illustration. We have passed by the old days of wood and stone. The cradle and the coffin are made of metal. The conveyances that we ride in along the street and the pleasure boat are made of metal. The man-of-war and the fortress resisting the guns must be made of steel.

"As our chairman told you in his very able address this morning, we are coming to the place where people will realize that mining in its broader phases and agriculture are but two equal supplemental divisions of the industry of our Nation, one as important as the other.

"The Government geological report for 1909 shows that in 1880 we used substantially $185,000,000 worth of metal produced from our storehouse. By the year 1900, 20 years later, that had increased to $511,000,000. In other words, after allowing for all reasonable change in the price of the commodity per pound, in 20 years we more than doubled the demand upon our storehouse for the use of metal therein contained; and in 1909 we had reached something like $750,000,000 annual production, proving that by 1920 we will again have doubled the demand upon the storehouse for the use of metal.

"Now, I do not believe it would be conservative or sound to say that we are rapidly approaching the place where metal can not be found, nor that we are immediately going to exhaust that storehouse. I do not believe that we have reached the place where any calamity views need be entertained; but I do believe we have reached the place where common sense and sound business policy should call upon the people of this Nation to use every reasonable endeavor to see that the metal extracted from the earth each year is put into form where it will be saved and used, and not wasted. That is the problem that is brought before you to-day. These Western States that I have mentioned and the Territory of Alaska produce substantially $250,000,000 worth of metal each year. This $250,000,000 worth, of course, includes silver and gold, and it is only fair to state that in certain sections of the country, like Cripple Creek, the miners have been able to effect a fairly successful saving of gold and silver contained in the ore, possibly 90 per cent—more probably an average of only 85 per cent—of the silver and gold contained in the ores bearing only those two products. But that is not the problem. The problem that arises in those mining sections is in treating what we call refractory or complex ores. The big veins cutting through the mountains contain lead and zinc and copper and iron and manganese and quartz, and perhaps half a dozen other metallic contents, combined in almost every conceivable form and proportion, and these big low-grade veins form the solid, permanent basis of the mining industry. Now, when you realize that a lead smelter can not treat zinc, but must burn it up, and that a zinc smelter can not successfully treat other metals, you will readily realize the difficult problem which is immediately presented to the man who is grinding that ore and sending it to the market. In this class of ore, known as refractory or complex ore, I believe it is safe to say that in the average low-grade mining district the saving effected in the course of milling does not exceed 70 per cent of the value of the contents. Seventy per cent saving necessarily means a 30 per cent loss or waste, because as a general rule the tailings from the mill go into streams or are scattered over the surface of the earth without being in any way conserved. Therefore the loss that is suffered is a permanent loss.

"It might be well to explain that in the low-grade mining districts of Colorado, Utah, and other States where the veins are known to occur, these low-grade ores in general carry values of from $4 to $20 per ton. Now, when you consider that these metallic contents are included along with quartz, or other materials constituting one-half or two-thirds of the total tonnage, and when you take into consideration the railroad freight that must be paid per ton and the rather high charge that must be imposed by any smelter that undertakes to treat ore containing so much silica, you will readily realize that the miners can not ship that crude low-grade ore to a smelter and have it successfully treated. Therefore the burden is imposed upon them of first separating out the silica or the quartz contents in connection with their ore. Next they must confront the problem of undertaking to separate zinc away from the lead, copper, and iron, and at the same time try to save the gold and silver value, so that when they market their product they may be able to send the lead and copper and iron to what is known as a lead smelter and the zinc contents of the ore to what is known as a zinc smelter. This presents a complex and difficult problem. I suppose there are a hundred different forms of mills or of machines or of contrivances that have been invented for the purpose of separating and treating these ores. Some are fairly successful in some branches of the industry, but no general solution of the problem has yet been presented. I believe it is safe to say, as I have told you, that the loss in this branch of the metal-mining industry will equal 30 per cent of the total product brought out of the ground.

"A further illustration of these losses may be found in the case of certain rare metals. For instance, in Boulder County, in Colorado, it was discovered a few years ago that minable quantities of tungsten existed. The miners there concluded that they would try to produce tungsten commercially. They found very substantial deposits of that metal. They proceeded to produce the metal, produce it commercially, and I understand they did so at a profit. But in producing the tungsten, as far as I have been able to learn, not less than 30 per cent produced from the ground is lost in the course of milling before the concentrates are shipped to the market.

"Another illustration of this same loss is in the venadium deposits also found in a southwestern county of the same State. Vanadium is used in hardening and toughtening certain varieties of steel and also for other purposes. It is a valuable metal, rather rare metal. Now, in the production of this vanadium which has been found in that county, it is reported that one company takes out that ore and ships it all the way across this country and across the ocean to Liverpool, in order to have it treated. The saving in Liverpool may be very good, but there is but little saving to the industries of our country in paying such freight, besides the treatment charge. Another company is undertaking to treat the vanadium on the ground by a process, as I understand, devised by their own metallurgists. It is stated concerning their own home treatment that the loss is at least one-third of the valuable metal; that they have found the saving only two-thirds.

"Another loss which is worth noticing in the metal-producing industry of the West is that of sulphur, arsenic, iron, manganese, and other similar materials, and chemicals of various kinds. These are disregarded because at the present time there is no profit in undertaking to save them. It is all right to talk of conservation, but no private citizen can afford to spend his own money and operate at a loss for the purpose of trying to conserve the natural resources; and it is only by the discovery of means which will enable him to conserve the natural resources while working at a profit that any miner will invest money in saving or producing a metal.

"Now, as a final effect of this loss in the treatment of the western metals, I believe it is fair to estimate that the $250,000,000 worth of metal marketed by these Western States and Alaska represent also an actual loss of metal which is not marketed of at least $50,000,000 per year in the lead, copper, zinc, gold, and silver alone, besides all the possible by-products. Then, when you consider the further loss, say 10 or 15 per cent, in the treatment of the simple gold and silver ores, and when you consider the further loss that is probably encountered in such States as Missouri and Wisconsin and Illinois in the treatment of any zinc or lead ore which happens to be in the leastwise complex, I believe it is safe to say that there stands here a problem of loss to our Nation of at least $100,000,000 per year of metal valuable in our industries and which some day will be indispensable to our industries. This is the problem that this congress, as I understand, proposes to present to the Federal Government; and it would certainly seem to be worth while for the Federal Government to interest itself in the solution of that problem.

"Now we have reached the point, in trying to discuss this question, of considering what it is proposed to ask the Federal Government to do. I believe there has been more misunderstanding, more misconception of this, not necessarily of the problem, but of its possible method of solution, than any other question that has come before this assembly. If you will stop and study the problem for a moment, you will readily realize that the problem is not one to be solved by the United States Government erecting a building like this, for instance, and setting up machinery there and shipping ore to that building to test it by that machinery. Why, if the Government had such a machine to-day, it would send it out to Colorado and Utah and mining would go right ahead. We would make other machines just like it. The trouble is that there is no such machine in existence for the mechanical saving of these metals. If there were, it would be patented by some private individual and he would make a million dollars a year out of it; or if he did not patent it, every mine in the States of Colorado, Washington, and Idaho would be using that one contrivance. Therefore, it is not a question of trying to procure the United States Government to erect a plant in Denver, nor in Salt Lake, nor in San Francisco, nor anywhere else. The problem is of such a nature that it is going to take years of work by the best metallurgists, by the best scientists, by the

best chemists, that our Government can afford to employ. I believe the final solution of this question will be a chemical or chemical and electrical solution and not a mere mechanical solution; but the work that is to be done must necessarily be done right down in the field where the problems exist.

"We need a department of mining of the United States, to be given money to commence on this work. An appropriation of at least $500,000 should be made for Mr. Holmes's department, so that he can commence upon the investigation of this problem in every mining district in the West. I do not mean by that each little isolated section, but each considerable section which appears to have problems peculiar to itself. In that way in your State of Utah you would be able to have a representative of the United States Government go in there in your district, analyzing your ore, watching the effect of each milling process that you are trying to put into effect, and he would finally, after a few months' study, be able to make a complete analytical report, not only upon your ore, but upon your processes and your saving and your problems. The same thing could be done down in the San Juan, or at Aspen, or up in Idaho, or in other mining sections. Then, after the local or field experiment-station work had progressed until some definite information had been obtained to be written down and compiled and printed as a general working basis, field experiment work would probably be undertaken. The local or field experiment stations are needed now; a general central plant may be needed later. The local stations should solve the problems, but if they show the necessity of a central plant, then you can locate your central plant at any point convenient for the mining sections; and then you will know for the first time what you actually want in that central plant or what could be devised for it.

"In the report of our president, in his address this morning (and which I believe will become as important as any public document which has been promulgated in our country for years), he has outlined to you very clearly the work undertaken and accomplished by the Agricultural Department. I believe it is safe to say that the agricultural experiment-station work of the United States has saved millions of dollars to the farmers. There is every reason to believe that if the work of the Federal Government is broadened out the same kind of work, or the same plan, can be instituted in the mining department, and just as great results will be accomplished; and there is some reason to hope that the results may be accomplished even more speedily. In the agricultural problems the question is generally a matter of long observation, of culture of plants, of watching the habits of insects, and of progress from year to year in undertaking to better the conditions of the industry. In other words, it is a culture or growth rather than a solution of a problem. While in the metal industry these problems are, in general, few in number and difficult of solution, yet they are in the nature of definite problems closely related to each other, and when the solution comes the remedy will be immediate and complete. I believe more is to be accomplished in the metal-mining industry by the Federal Government for the same amount of money expended than can be accomplished in the Agricultural Department. Now, if the Federal Government, by the investment of a few hundred thousand dollars in establishing these experimental stations, first in the districts that need them most and later in any district in any State where a substantial saving to the people may be effected, if the Federal Government by such limited investment can save one-tenth of what is now going to waste of those metals, is it not worth while? Ten million dollars saved by a few hundred thousand dollars investment should be a sound investment, whether for the Federal Government or any private industry. If the Federal Government can be so successful as to make a complete success in the solution of these problems we have here presented, which are only a part of the problems of the industry, then it will mean a saving to our Nation of at least $100,000,000 per year.

"Now, I believe that every patriotic citizen of this country views with approval the appropriation by our Congress of nearly $100,000,000 for the purpose of supporting the Army—that is, just so long as that Army is necessary; and I believe that every patriotic citizen likewise approves the appropriation of something like $125,000,000 by Congress for the support of the Navy so long as such a Navy is necessary. But I want to ask if it is not sound business, as well as sound government, to make a limited appropriation for the purpose of conserving and saving and producing the metals with which the armies must be equipped, with which the navies must be built, with which homes and cities and industries must be founded. The first effect of any such a move by the Government would, of course, be a profit to the metal-mining industry; but I have tried to show you that it is a foundation industry, a basic industry, in those Western States—in Illinois, in Missouri, in Michigan—wherever metal is produced, furnishing the market to the agriculturist, who stands by ready to supply the provisions, furnishing the market for the factories of the East that must supply hundreds of articles to every mining section of the western part of the Nation. There is something more about this. The Federal Government by undertaking such a campaign as this is not only bringing profit to the industry, it is not only improving the condition of every State which has the industry, it is conferring a direct and substantial benefit upon the whole people of America. Wherever an industry is enabled to produce at a less cost—or, what is the same thing in the operation of an industry, if it is enabled to save the entire product instead of losing one-third of it—then the natural, the inevitable result will be that the industry itself will be satisfied to take a less proportion, and the people at large will receive the final product of that industry for a less price. To-day your price of copper, your price of lead, your price of zinc, is fixed by the necessary charge on it in order to have it produced at a profit. If the United States Government can so far help the miners, those who are mining and treating this ore, that they can save the entire metallic content of the ore, more metal will be produced from year to year with the same work, and the people of the United States will receive a fair share of the benefits at a reduction in price; yet the industry itself making the reduction will not lose; it will receive enough to make it prosperous.

"As an illustration of the benefits to the whole people, I want to call attention to the tungsten production for one county in Colorado. Because it found it could produce that article commercially and profitably, it produces 80 per cent of the tungsten of the United States. That would appear to mean profit to that county alone, but it does not work that way. That county does receive profit, but the tungsten is used to double the durability and value of steel, a certain class of steel that is needed by the people; and now that it has become cheap enough, tungsten is used to make the filaments in the electric lamp, and in turn in every home throughout the land the amount of illumination through the electric lamp, for the same cost of power, for the same expense, is practically doubled through the use of the tungsten filament. The same effect is brought about by the successful mining of vanadium. Now, they have been able to reach a stage where they save two-thirds of the vanadium, and by using an exceedingly small proportion or fraction of 1 per cent of vanadium in steel it seems to double the value of certain high-speed tool machines by doubling the durability. In other words, the benefit comes back to the whole people.

"I do not wish to take more of your time; I believe that the members of this convention do not need to be persuaded to vote for a resolution asking Congress for a liberal appropriation for the purpose of enabling the metal miners of the United States to save that $100,000,000 that to-day is lost. That metal loss is practically a permanent loss. Now, we hear a great deal about conservation. The term is used every place it will apply, and sometimes where it will not apply. I want to tell you, however, that in comparing the conservation of timber and of metal there is something that is well worth considering. If the timber in a certain area of the country be destroyed or be used up, it is possible to reforest that entire area with better trees than grew there before in 60 to 70 years. In other words, while it is right to save the trees, yet if we do happen to use up the timber in a certain district the loss is not beyond remedy; it is not one from which we can not recover. But when we waste the fifty to one hundred millions per year of zinc, lead, copper, tungsten, iron, and gold and silver, the loss is practically irretrievable. It is a loss that can not be replaced; and it is not too much to say, when we are doubling the output of these metals every 20 years, that whether or not there is danger that we are going to run out of the metal, it certainly is sound common sense for our Federal Government to cut off that loss if there is any possible way to do it at any reasonable expenditure. As I started to tell you, I believe it would not be necessary to persuade any member of this convention to vote for such a resolution, but we ask you to do more than vote here. I believe it is the duty of the members of the American Mining Congress when they return to their homes to take up this question with their Congressmen and with the friends of their Congressmen, so that the great metal-mining industry, which to a great extent forms the basis of a successful coal-mining industry—so that this great metal-mining industry may be placed upon a sound and prosperous basis, where the product extracted from the earth will be saved for the benefit of our people and given to them instead of being wasted.

"Just one more suggestion on conservation. It may be right in trying to conserve timber to restrict the use of that timber, but in trying to conserve metals I believe that it is not the right method of conservation. If you extract the metals, such as copper, from the earth and put them in the form of bars, they are practically as indestructible above as they ever were below the ground. The right conservation of metal is not to prohibit the people from freely using metal or to try to impose leasing systems or restrictions upon the metal miners so that they can not mine the metals. The real conservation of metals is to see that the entire metallic content of the ore mined is saved and put into form where it is practically indestructible for all time.

"If the Federal Bureau of Mines shall lead the way in solving these important existing problems of the metal-mining industry, it will thereby increase the general prosperity of the mining States, promote the welfare of the principal industries throughout all the States, and effect a tremendous saving in the permanent wealth of our country."

STATEMENT OF HON. JOSEPH HOWELL, OF UTAH.

Mr. HOWELL. Mr. Chairman and gentlemen of the committee, H. R. 11853, which I have introduced, presents the same principle as that so ably discussed by Mr. TAYLOR. Salt Lake City is another suitor for a mining experiment station. This city is so situated in the heart of the great metalliferous mining region of the West and possesses other features of advantage for the location of such a station unequaled by any other place. But my chief purpose this morning, Mr. Chairman, is to urge an extension of the work of the Bureau of Mines, so as to include in the scope of its usefulness technologic investigations in metallurgy and a study of metalliferous mining. The mining States for many years have been knocking at the doors of Congress for the establishment of a department of mines, but not until they secured the cooperation of the coal-mining interest of the East were they enabled to make much headway. Finally, after a persistent effort, the Bureau of Mines was created. This was hailed with a great deal of satisfaction by those engaged in precious-metal mining as an evidence that the great mining industry was about to receive the fostering attention of the Government that it deserved as one of the great basic industries on which rests the welfare and prosperity of our people. There were those in the beginning that opposed the Department of Agriculture and sneered at the futility of the General Government's activities in this respect, but time has abundantly proven the wisdom of the farsighted statesmen who advocated the promotion of agriculture by the General Government.

The Department of Agriculture has grown to be indispensable to the country. Its beneficial work, like a candle set upon a hill, shines upon the whole country. In the light of what has been accomplished for agriculture, we can confidently look forward to like achievements in the field of mining—its twin sister. These two industries are the source of all that we require for the welfare of mankind. Why should not the mining industry receive the same encouragement at the hands of the General Government as agriculture? The Bureau of Mines in the inception of its mission has confined its efforts largely to the coal-mining industry, and has done most excellent and praiseworthy work in that field. The horrible catastrophes constantly happening in coal mines have stirred the whole people and caused a demand on the part of the Government to put forth every possible effort to avert a recurrence of these calamities in the future, and toward improving the conditions affecting the health and safety of the miners. But the time has come that the metalliferous miners demand some attention to their industry. Here is a field lying fallow for scientific research and investigation. The mining of precious metals in our country is in its infancy. Only the richest and most tractable ores have been made to yield their treasure. Millions of dollars of ore have been taken from mines and thrown aside, because no known process permitted their reduction at a profit. Other millions of tons of ore lie undisturbed in our mountain vaults for want of knowledge to profitably extract their values. Then there is the problem of controlling the poisonous fumes that issue from smelters and destroy all vegetable growth in the vicinity and provoke never-ending bitter legal controversies to burden our courts. Scientific and economic experimentation along these lines are entirely beyond the reach of private investigation. This can be properly and adequately undertaken only by the General Government. What a field for effort! How pregnant of possibilities for the enrichment of the Nation! What an aim for the conservationist in utilizing to the highest degree our unborn wealth!

The Durango Exchange, of the city of Durango, Colo., represents, substantially speaking, the entire business interests of

all southwestern Colorado. That organization recently passed a resolution upon this subject that I will take the liberty of inserting in the RECORD at this place, as follows:

Resolution by the Durango Exchange concerning the Silverton mining experiment station.

Resolved by the Durango Exchange, in regular meeting convened, That we do earnestly appeal to the honorable Secretary of the Interior and to the honorable Director of the National Bureau of Mines that the first mining experiment station to be established under the Federal law authorizing the establishment of such stations shall be placed at Silverton, Colo.; that we do request our United States Senators and Representatives in Congress to use their best efforts toward presenting and obtaining recognition of the claims of Silverton to such first station; that in support of this resolution we do respectfully represent that Silverton is most favorably situated in the center of the largest, most continuous, most compact, mineralized area of mining country in the West; that directly tributary to Silverton the numerous big mineral districts produce and furnish all of the metals and combinations of ores found in other parts of Colorado, as well as ores difficult of treatment and not found elsewhere; that new deposits, such as uranium, borax, tungsten, platinum, and others not yet identified, are being found in this district, to the great extension of the heretofore known mineral territory; that the actual, present, and serious problem of the mining industry is the loss of 40 per cent or more of the valuable metals contained in the ores, in treatment by existing methods, and that this problem exists in the actual field of mining and milling operations, and must be solved there, in practical operations on a big tonnage basis, and that experimental work, to be practical and efficient, needs to be in direct contact with the operating industry.

Silverton was the pioneer in asking for and working for the establishment of a local Federal mining experiment station, and because her citizens knew the actual needs of the mining industry they have worked long and incessantly for the establishment of Federal experiment stations.

Our Colorado Legislature in 1911, and again in 1913, by unanimous vote, indorsed and requested the establishment of the Federal mining experiment station at Silverton, Colo. (See Colorado Session Laws of 1911, p. 712, and of 1913, p. 645.)

Therefore, in fairness to Silverton, in accordance with the legally expressed desire of Colorado, and especially for the most efficient possible aid to the metal-mining industry, we urge that the first experiment station shall be granted to Silverton.

THE DURANGO EXCHANGE,
W. I. GIFFORD, *President.*

Attest:

R. M. MORRIS, *Secretary.*

President Wilson recently paid tribute to the work of the American Mining Congress and recognized the importance of the subjects covered by this bill and the general interest now being taken in mining development and safety work as follows:

PRESIDENT WILSON COMMENDS MINING CONGRESS.

The following letter from President Wilson to the members of the American Mining Congress was read at the annual convention of that body held in Phoenix, Ariz., December 7–11, 1914:

"To the members of the American Mining Congress:

"I regret exceedingly that, owing to the press of circumstances, it will be impossible for me to greet you in person at the seventeenth annual session of the American Mining Congress at Phoenix, Ariz.

"I am well aware of the important part played by your great organization in the creation of our Bureau of Mines and am sure that the good work of that bureau in attempting better to safeguard the lives of the 2,000,000 men employed in the hazardous mining and metallurgical industries will continue to redound to your credit, as well as to the credit of the bureau itself.

"It will always be a tribute to your foresight and energy that this new Federal organization in the short period of its existence, with the kindly cooperation of State and their agencies, has been able by persistent and intelligent effort to turn an isolated local movement for greater safety into a great national movement for 'safety first' and has already gone beyond the mining industry of the country. I venture to say that thousands of lives have been saved by that movement, and that many thousands more will be saved in the future.

"Gratifying as the results of this life-saving campaign may have been, however, there is still vigorous work for your congress to do. I am informed that during the last year more than 3,000 men were killed and 100,000 injured in the mining and metallurgical industries of the country. At the same time, those in authority tell me that, from their observation and experience, one-half of such deaths and three-fourths of such injuries may be regarded as easily preventable.

"I suggest this situation as an opportunity for further endeavor on your part to cut down this excessive toll of death and injury. I can assure you of the fullest cooperation of all the proper governmental agencies, also of my earnest desire for your active and continued assistance.

"There is one other problem connected with the mining industry in which the Federal Government is vitally interested, and that is proper conservation and proper use of the mineral resources of the Nation. I realize that you, too, are interested in this problem, and I wish merely to call it to your attention because of its fundamental importance to the present and future prosperity of the Nation. I am happy to say that the profligacy of the past in the use of these resources is not being continued on so large a scale. There is, however, great opportunity for further reform along these lines, and in this your organization can be of invaluable service.

"Sincerely, yours, WOODROW WILSON."

The last Democratic national platform, adopted at Baltimore in 1912, contained a plank upon this subject, as follows:

We rejoice in the inheritance of mineral resources unequaled in extent, variety, or value and in the development of a mining industry unequaled in its magnitude and importance. We honor the men who, in their hazardous toll underground, daily risk their lives in extracting and preparing for our use the products of the mine, so essential to the industries, the commerce, and the comfort of the people of this country. And we pledge ourselves to the extension of the work of the Bureau of Mines in every way appropriate for national legislation with a view of safeguarding the lives of miners, lessening the waste of essential resources, and promoting the economic development of mining, which, along with agriculture, must in the future even more than in the past serve as the very foundation of our national prosperity and welfare and our international commerce.

Hon. J. F. Callbreath, secretary of the American Mining Congress, in an article in the January, 1915, number of the Mining Congress Journal, presents his views upon this subject very forcibly, as follows:

METALLURGICAL RESEARCH AND MINE SAFETY STATIONS.

There was recently in the United States a scattering epidemic of the foot-and-mouth disease among cattle, resulting in a rigid quarantine being established by the Department of Agriculture and the destruction of several hundred animals.

Immediately the congressional machinery was started to reimburse the farmers for their losses, and to appropriate funds to stamp out the disease and prevent its recurrence. Members of Congress suggested bills providing for this aid to the agricultural industry.

In the bill making appropriations for the Department of Agriculture for the next fiscal year now before Congress the committee has authorized an appropriation of $2,500,000 to take care of this situation.

In one of the best-known metal-mining districts of the United States, in addition to the number of men killed by accident, in the year 1912 there were 720 deaths from miners' consumption out of about 7,200 employed, 10 per cent in one year. Ten years of such conditions wipes out an important mining camp. This almost unbelievable condition has apparently existed for many years, with the loss of hundreds and hundreds of men. It is also stated that at the present time from 30 to 60 per cent of the miners employed in mining operations in this district now have tuberculosis.

In spite of this condition—and we know that miners' consumption is an occupational disease caused by stone dust in the mines, and largely preventable—there is no great national agitation, and there has been no particular suggestion from Congress that an immediate appropriation should be granted to investigate the causes of this disgraceful condition and to obviate them.

In one instance you have the deaths of cattle through a highly contagious disease, the great National Government stepping in with $2,500,000 to pay for the ravages of this disease and to exterminate it, and in the other you have the slaughter of human beings with no particular remedy or aid being suggested.

The point to all this is that agriculture is the best known and best cared for industry in the entire United States, and that the mining industry, despite the fact that it is second in importance as a basic industry, is the worst understood and the least aided.

It is not that Congress intentionally discriminates against the mining industry; it is rather that every man connected with agriculture has been alive and energetic to any aid that the Federal Government might give to their industry, and, I regret to state, the unwillingness of the men in the mining industry to present their cause to Congress.

With the creation of the Federal Bureau of Mines some advance has been made, but the industry is still far behind agriculture in Federal recognition.

Now, here is your chance to help:

There is now pending in Congress a bill to establish in the larger developed mining regions of the country 15 movable mine safety stations for rescue cars, with a view to advancing more rapidly and in a more satisfactory manner the mine safety education and mine rescue work under the Bureau of Mines, and to establish 15 experiment stations in important metal-mining regions in public-land States, with a view to the advancement of the mining industry in those regions.

Deaths in the mines.—The Bureau of Mines finds that the progress it is making in the saving of life is extremely slow, and it is one of the purposes of this bill to expedite this humanitarian work. In the year 1913 in the mines and quarries of this country 3,651 men were killed, a death rate of 3.49 for each 1,000 employed.

No one likes to estimate the money value of a human life, but at times it becomes necessary to do this, especially in working out the economics of compensation acts. It is a reasonable estimate that during the past 10 years more than 30,000 men have been killed and more than 100,000 seriously injured in connection with the accidents in the mining industries of this country. It is impossible to estimate the number who have suffered from bad health conditions in many metal-mining, tunneling, quarrying, metallurgical, and other mineral-industry plants. It is impossible to estimate the number of men with health shattered through these conditions who have had to give up their work for years before their natural time or the number of dependents who have suffered thereby.

If it be assumed that each human life is valued at $3,000, it will be seen that the deaths alone in the mines have cost in the 10 years $90,000,000.

If each of the 100,000 seriously injured lost 20 days, at $3 per day, a reasonable assumption, this represents $6,000,000 lost from this cause.

Whatever may be the value put upon human life in arranging for a reasonable compensation, these losses of life and labor are national in their extent and character and fall ultimately upon the general public as representing the consumers of mineral products.

A comprehensive investigation of conditions affecting the health of workers is one of the urgent existing needs of the mining industry. Such investigation would affect the health condition of one and a half million men employed in these several phases of the industry, and no one familiar with conditions will for a moment question its importance. In conducting it the Bureau of Mines would have the active cooperation of the Public Health Service, which would study the different ways in which mine conditions affect the health of employees, while the Bureau of Mines would seek to ascertain the existence and the causes of bad health conditions and the methods of improving the same.

A large proportion of the men entering the mines in the United States each year come from the farms and villages of different European countries; they are unfamiliar with our language, our institutions, and our laws, and know little or nothing of mining.

A majority of the men now working in the coal mines of the United States to-day speak and read but little English. It is therefore difficult to reach these men through publications, even when the latter are prepared in the most simple and elementary manner.

The mine rescue cars.—The plan followed most successfully by the employees of the Bureau of Mines in reaching and interesting these men is through giving actual working demonstrations in mine rescue, first aid, and other safety measures and methods, and the giving of lectures illustrated with lantern-slide pictures which contrast the safe and the dangerous methods. Each of these pictures used has a short, one-line description under it in four or more different languages most common among the miners. In these lectures and demonstrations local interpreters are used at intervals as the need for them may appear.

Work of this kind develops a new interest in the safety work among the miners, and following the movements of each of the existing rescue cars this interest on the part of the miners is shown in their call for the publications which treat of the mine safety work.

So far as it has gone this educational work is assuredly developing safer and better mining, and the leaders among the miners express the belief that if carried forward on a larger scale and in a more thorough manner the work can not fail to develop also better citizenship among these miners.

The work of the States in carrying out their part of this general program in mine safety is being carried forward in a reasonably satisfactory manner. The States are already expending in their inspection and police supervision work more than the Federal Government is expending in all of its investigations in behalf of mine safety. Thus, for example, a single State—Pennsylvania—maintains a well-organized and efficient inspection force, which includes a chief and 50 district inspectors; it expends in the maintenance of the work $213,000 per annum, paying its district inspectors an average compensation of $3,000 each in addition to traveling expenses. All of the other coal-mining States maintain a system of inspection.

The proposed experiment stations.—There are located within the boundaries of the several public-land States large bodies of low-grade ores of different types for the efficient treatment of which there are no known methods. There are other large deposits that are being worked in accordance with methods that are highly wasteful of valuable mineral products. On the public lands in these States there are many mineral deposits concerning the value of which little is at present known. These and other associated problems, general in character, will be investigated by the several mining experiment stations to be established in such regions, and it is believed that the results of such investigations will be not only beneficial to the industry, but also to the general public.

Mining is usually regarded as an industry made up mainly of the operation of a few large, profitable properties, such as old Comstock mines in Nevada, the Treadwell mine in Alaska, or the Homestake mine in South Dakota. It is usually considered to be an industry controlled by a few parties, the owners of which large properties would gladly avail themselves of an opportunity to unload on the National Government the cost of conducting researches in which they are particularly interested. Therefore it is usually considered as an industry which should be allowed, and even required, to take care of itself. These assumptions are far from correct.

The facts of the situation are: These large, profitable properties are few in number; that so far as known their owners have never joined in a request for Government appropriations to aid the mining industry, nor have they been given any special consideration either in the establishment or in the plans of the Bureau of Mines. They have neither asked for assistance, nor have they endeavored to unload upon the Government any investigations of their own. On the contrary, at the request of the Bureau of Mines a number of them have expended considerable allotments of their own funds on investigations which promise to be useful not only to them, but to other less important mining developments in which they were in no way involved.

While the number of large mines in this country is small, there is a large number of small mines. The records show that in the country as a whole there are about 40,000 coal mines, metal mines, and quarries, and about 170,000 oil wells, operated to a smaller or larger extent in connection with the mining operations. In addition to these there is a large number of operating plants connected with the smelting and other metallurgical operations and various mineral industry operations in different parts of the country. Few seem to appreciate the importance of helping those who hold these small properties to find methods of operation by which they can be worked at a profit instead of being helplessly transferred to a few large corporations, who alone may have the funds for developing the processes that will make such operations possible.

What the Federal Government is doing for agriculture.—Congress is now appropriating as an aid to agricultural advancement nearly $28,000,000 per annum, while mining is receiving through the Bureau of Mines and the United States Geological Survey less than $2,000,000. The per capita contribution from the people of the United States for the advancement of agriculture amounts to 28 cents and for mining 2 cents.

The Silverton Commercial Club has during all of these years been patiently and diligently working for the passage of this bill, and great credit should be given to Hon. W. N. Searcy, judge of the district court of that judicial district, and to State Senator John T. Joyce, of Silverton, for their untiring efforts in this matter. They have written many articles and done a tremendous amount of work in appealing to nearly all mining men and associations in the United States for support in the enactment of this legislation; and I feel that their untiring efforts should be mentioned in the RECORD as an inspiration to others to perform years and years of loyal services, against almost unsurmountable obstacles, for the general welfare of our country.

The bill that I reported to the Sixty-second Congress was never reached for consideration and died upon the calendar. On the first day of this Sixty-third Congress, April 7, 1913, I reintroduced the bill again as H. R. 1646, and after further hearings and amendments I reintroduced it again on December 20, 1913, as H. R. 11098. A number of other Members from the Western States have during the past two or three years introduced bills for the same purpose, and this present bill may now be termed a composite committee bill representing all those various measures.

The report upon this bill, as well as the bill itself, now applies not only to metalliferous mining but to coal mining and to mine rescue stations, which are so much needed for the protection of life, especially in coal-mining operations. So that while this measure was originally started as a metalliferous mining-experiment station bill for Silverton, Colo., it has been vastly broadened and extended. It is now a great national measure providing for safety, efficiency, and conservation in all mining operations throughout the United States and Alaska. The bill in its present form is as follows:

An act to provide for the establishment and maintenance of mining experiment and mine safety stations for making investigations and disseminating information among employees in mining, quarrying, metallurgical, and other mineral industries, and for other purposes.

Be it enacted, etc., That the Secretary of the Interior is hereby authorized and directed to establish and maintain in the several important mining regions of the United States and the Territory of Alaska, as Congress may appropriate for the necessary employees and other expenses, under the Bureau of Mines and in accordance with the provisions of the act establishing said bureau, 10 mining experiment stations and 15 mine safety stations, movable or stationary, including those already established, the province and duty of which shall be to make investigations and disseminate information with a view to improving conditions in the mining, quarrying, metallurgical, and other mineral industries, safeguarding life among employees, preventing unnecessary waste of resources, and otherwise contributing to the advancement of these industries: *Provided*, That not more than three mining experiment stations and mine safety stations hereinabove authorized shall be established in any one fiscal year under the appropriations made therefor.

SEC. 2. That the Secretary of the Interior is hereby authorized to accept lands, buildings, or other contributions from the several States offering to cooperate in carrying out the purposes of this act.

Passed the House of Representatives February 1, 1915.

Attest:

SOUTH TRIMBLE, *Clerk*.

The bill now has two main purposes: First, to establish 10 metalliferous mining experiment stations in important metal-mining regions in the public-land States, and one in Alaska, with a view to the developing of the mining industry of those regions in a great many different ways, but especially in the ascertainment of processes for the treatment of the unlimited quantity of low-grade, complex, and refractory ores, and of educating the people in the way of the economical and practical handling of those ores and the saving of their values and preventing the enormous waste of the valuable metals that has heretofore occurred. The second purpose of the bill is the establishment throughout the various coal-mining regions, as well as the metalliferous-mining regions of the country, 15 movable mine safety stations, for rescue cars, with a view of advancing more rapidly and in a more satisfactory manner the mine-safety education and mine rescue work under the supervision of the Bureau of Mines. The report upon this bill contains a large amount of valuable information that I feel should be preserved in the RECORD, and I will take the liberty of inserting the greater portion thereof as follows:

This legislation has been prepared with considerable care. It is not based upon the plans or wishes of any one person or organization, but it has been drawn up as a result of a series of conferences among the miners, mine operators, mine surgeons, and engineers from different parts of the country, careful consideration having been given to the needs of the industry and of the country along the lines indicated.

CONDITIONS SHOWING THE NEED FOR THIS LEGISLATION.

(1) That the mining industry of the country, and especially the metal-mining industries in our public-land States, are not keeping pace with the normal development of the country is clearly shown by the following data:

In the population of the public-land States west of the Mississippi and Missouri Rivers there was an increase from 14,800,000 in 1900 to 19,600,000 in 1910, an increase of 32 per cent.

The agricultural crops of the public-land States had a valuation in 1900 of $921,000,000, and a valuation in 1910 of $1,950,000,000, an increase of 112 per cent.

During similar periods the average annual valuation of all the mineral products in the public-land States increased from $287,000,000 during the period 1901 to 1905 to an average annual valuation of $358,000,000 during the period from 1906 to 1910, an increase of a little less than 25 per cent; whereas the production of the precious metals in the public-land States decreased from an annual average valuation of $136,000,000 during the earlier period (1901–1905) to an average annual valuation of $127,000,000 during the latter period (1906–1910), a decrease of nearly 7 per cent.

No better illustration could be given of the contrast in the treatment of these two great national industries than the fact that in spite of this lagging behind of the mining industry during this 10-year period, the National Government expended for the reclamation of agricultural lands in these public-land States not only all of the moneys received from the sale of public lands for agricultural purposes, but also nearly $7,000,000 received from the sale of mineral lands.

The reduction in the number of men employed in the different metal-mining industries in the public-land States tells even more clearly than do the figures of production the falling behind of the mining industry. Unfortunately, the figures for the number of the men employed are not available for a majority of the public-land States.

Taking a single one of these States as an example, attention may be called to the fact that the average number of men employed in the metal mining and metallurgical industries in the State of Colorado for the four-year period 1900 to 1903, inclusive, was 36,189; during the period from 1904 to 1907 this annual loss was reduced to 34,364; and during the four-year period from 1908 to 1911, inclusive, the number of employees was further reduced to 22,560.

(2) Among the causes of this lagging behind of mine development are the following: (a) The exhaustion now under way of the more easily discovered and richer ore deposits and the fact that other rich ore deposits are not now being discovered to such an extent as to replace those now being worked as they become exhausted; (b) the absence of known methods through the use of which many existing low-grade ore deposits can be profitably worked; (c) the wasteful methods now followed in many of the mining and metallurgical operations, which, while in many cases they still bring temporary profits to mine operators, are reducing the national wealth in a manner which can be remedied only by the discovery and use of more efficient methods of treatment.

(3) Of a number of our important mineral resources we have for both the present and future needs of the country but one inadequate

supply. The utilization of certain of these important resources, as in the case of coal, oil, and natural gas, destroys them. Common prudence demands that through the necessary researches the Nation should learn how to use this one supply of its mineral resources more wisely and more efficiently or with less waste or loss than is now the case.

(4) The loss of life in the different branches of the mining industry is a discredit to the Nation. It calls for more extended inquiries and researches on the part of the Federal Government and a proper dissemination of the results obtained; it calls for more stringent police supervision or inspection by the States, and for more determined cooperative effort on the part of both the miners and mine owners in the way of making and enforcing safety regulations.

The National Government should do its full duty in this matter without further delay.

MINING, LIKE AGRICULTURE, WILL BE BENEFITED BY THE LARGER CONTRIBUTIONS FROM THE FEDERAL GOVERNMENT.

Congress is now appropriating as an aid to agricultural advancement nearly $28,000,000 per annum. These funds are being expended and the work authorized is being carried forward through a well-organized department with a Cabinet head and with nearly 14,000 employees.

That these large expenditures have resulted in still larger benefits to the country there can be no doubt; and one of the evidences of benefits is to be seen in the large increases in the aggregate value of the farm products of the country, which had an estimated value of less than $5,000,000,000 in the year 1898 and nearly $9,000,000,000 in the year 1912.

The conditions underlying agricultural progress differ as to many details from those associated with mining, but the broad general principles of progress are the same; and the favorable response to the national aid for agriculture is itself an evidence of the result which can be depended upon if similar aid is extended to mining. Furthermore, the less extended actual experience growing out of the more limited expenditures through the Geological Survey and the Bureau of Mines on behalf of the mining industry furnishes specific evidence of the larger benefits which may be expected to result from larger expenditures in similar directions. Thus, under the Bureau of Mines, through a small expenditure, the saving in national wealth through stopping the waste of natural gas in a single season has aggregated more than $10,000,000, which is several times the total cost of the maintenance of the Bureau of Mines from its beginning.

The benefits which may be expected from more liberal aid to the mining industry will come (1) through the lessening of the unnecessary waste in the mining and treatment of the various mineral products; (2) through increased efficiency in mining operations by the improvement of health and safety conditions; (3) through the development of more efficient and cheaper methods in the treatment of low-grade ore deposits, which are either not now worked at all or are worked only in their richer parts or pockets. These benefits may come about either through the discovery of new methods in connection with the researches by the bureau itself, or through its activity in stimulating researches by private parties.

THE COUNTRY'S RELATION TO ITS TWO GREAT FOUNDATION INDUSTRIES.

A brief statement of facts will indicate in a general way what the National Government is doing to aid development of each of its two great basic industries, and what in turn these two industries are contributing yearly to our national wealth and progress. While the figures are not fully comparable in all respects, they will be found to be essentially correct.

AGRICULTURE AND MINING, THE NATION'S TWO GREAT FOUNDATION INDUSTRIES—WHAT THEY ARE DOING FOR THE NATION AND WHAT THE NATIONAL GOVERNMENT IS DOING FOR EACH OF THESE INDUSTRIES.

What these industries do for the Nation:

	Agriculture, including forestry.	Mining and mineral industries.[1]
Number of employees	13,000,000	2,300,000
Yearly value of products	$10,500,000,000	$4,600,000,000
What each worker in these industries contributes to the national wealth yearly	$800	$2,000
What each industry contributes to the freight tonnage of the country yearly .....per cent..	22	60

[1] The scope here includes mining, metallurgical, and other mineral industries, as does the work of the Bureau of Mines.

What the National Government is doing for each of these industries:

Yearly appropriations.	Agriculture.	Mining.
For education:		
From direct appropriation	$2,500,000	Nothing.
From land grants	1,030,000	.....
From Smith-Lever Act for demonstration educational work	[1] 480,000	.....
For 52 experiment stations, one in each State and Territory	1,550,000	Nothing.
For general researches and other work to aid agriculture and mining	22,410,000	[2] $1,967,000
Total	27,970,000	[2] 1,967,000
Per capita contribution from the people of the United States for the advancement of these industries	$0.28	$0.02
Of this contribution the per capita expenditure for safeguarding the lives of 2,300,000 employees in the mining industry is about one-half of 1 cent per annum	.....	.005

[1] $480,000 for 1915; increasing to $4,580,000 for 1925 and each year thereafter.

[2] Of this amount less than $500,000 is expended under the Bureau of Mines in behalf of improvement of safety and health conditions among the 2,300,000 employees in the mining industry; the remainder (about $1,300,000) is expended for geology, topography, water powers, and other problems having to do with the commercial side of mining and other industries, under the Geological Survey; and $135,000 is expended under the Bureau of Mines for the commercial testing of the coal and oil used by the Government.

Nothing can show the national neglect of the mining industry more clearly than does the above tabular statement, in spite of the hazards of that industry and the other conditions which should appeal to the humanitarian as well as to the commercial instincts of the people. But another fact that tells the story with equal emphasis is that during the past 10 years, in addition to the large sums paid out of the National Treasury for the benefit of agriculture and the payment toward the reclamation of agricultural lands in the Western States of all funds arising from the sale of public lands in those States, even the proceeds of the sale of the Nation's mineral resources in like manner have gone not to aid mining, but to the reclamation of additional agricultural lands.

WHY THE MINING INDUSTRY HAS RECEIVED RELATIVELY SO LITTLE NATIONAL AID.

Agriculture is much the larger of the two industries; it embraces a larger number of persons, more widely distributed, and each acting as an independent agent. Its products, supplying the country with food and clothing, bring this industry even closer to the lives of the people than is the mining industry, which supplies them with the fuel which cooks their food, heats and lights their houses (built largely of mineral products), operates and supplies a large share of the materials and all the machinery of their factories, conducts and operates largely their facilities for transportation and communication, and supplies more than 60 per cent of the total freight tonnage of the country.

But, more than the above, there must be some special reasons why the mining industry has received relatively so little aid from the National Government, and these are to be found, no doubt, in certain misapprehensions concerning the industry. Mining is usually regarded as an industry made up mainly of the operation of a few large, profitable properties, such as the old Comstock mines in Nevada, the Treadwell mine in Alaska, or the Homestake mine in South Dakota. It is usually considered to be an industry controlled by a few parties, the owners of which large properties would gladly avail themselves of an opportunity to unload on the National Government the cost of conducting researches in which they are particularly interested. Therefore it is usually considered as an industry which should be allowed, and even required, to take care of itself. These assumptions are far from correct.

The facts of the situation are: (1) These large, profitable properties are few in number; that, so far as known, their owners have never joined in a request for Government appropriation to aid the mining industry, nor have they been given any special consideration either in the establishment or in the plans of the Bureau of Mines. They have neither asked for assistance nor have they endeavored to unload upon the Government any investigations of their own. On the contrary, at the request of the Bureau of Mines, a number of them have expended considerable allotments of their own funds on investigations which promise to be useful not only to them, but to other less important mining developments in which they were in no way interested.

(2) While the number of large mines in this country is small, there is a large number of small mines. The records show that in the country as a whole there are about 40,000 coal mines, metal mines, and quarries and about 170,000 oil wells, operated to a smaller or larger extent in connection with the mining operations. In addition to these there is a large number of operating plants connected with the smelting and other metallurgical operations and various mineral industry operations in different parts of the country. Few seem to appreciate the importance of helping those who hold these small properties to find methods of operation by which they can be worked at a profit instead of being helplessly transferred to a few large corporations who alone may have the funds for developing the processes that will make such operations possible.

(3) The most urgent appeal for larger national aid to the mining industry comes from and on behalf of the 2,300,000 employees of the different branches of the industry, who are asking the aid of the Government in the development of safer and more healthful working conditions. This humanitarian appeal should be given precedence over calls for appropriations to advance commercial gains. It comes from employees working under hazardous conditions, and a majority of whom are unfamiliar with our language, our laws, or our institutions, who have not yet realized the good will of any Government. They have been led to believe that the Government of the United States is interested in their welfare and was planning to aid in bringing about safer and healthier conditions in the mining industries of this country; but they are becoming discouraged as to the realization of such plans.

(4) Another important need to be met through these larger contributions to the aid of the mining industry is on behalf of the consumers or users of the mineral products distributed throughout every section of the country. These mineral products are coming to be more and more indispensable for use in the domestic life of the people as a basis of our manufactures, a basis of transportation facilities, and in supplying the products to be transported. Under normal conditions, as our mines become deeper and our mineral resources depleted, the per capita cost of mineral products is increasing, and one important purpose of the larger investigations authorized in the pending legislation will be that of finding out how this cost may be kept down to a minimum.

The increasing per capita consumption of mineral products is illustrated by the facts as to coal. The per capita consumption of coal in 1870 was less than 1 ton; it increased to 2½ tons in 1890, and to nearly 6 tons for the year 1913.

SOME SPECIAL REASONS WHY MINING SHOULD RECEIVE LARGER NATIONAL AID.

(1) In agriculture, with ordinary care of our soils, the country may be continuously supplied with annual crops. In dealing with the mining industry the fact should be kept in mind that the country has but one supply of mineral resources; that this one supply must meet the future as well as the present needs of the Nation; and that a century's experience points clearly to the fact that our needs for the more important of these resources, such as mineral fuels, precious metals, potash and phosphate deposits, will increase much more rapidly than will our population.

(2) While certain of our mineral resources, as in the case of metals, are destroyed rather slowly in use, other essential resources, such as coal, oil, and natural gas, are consumed or destroyed beyond recovery in use.

(3) In the utilization of certain of our mineral resources, such as the natural fuels, zinc, and some other of our metals, there are large losses or wastes which are believed to be unnecessary; and it is a wise duty of the National Government that it should aid in the prevention of such wastes.

(4) And more important than all the above in their appeals for the larger aid of the Federal Government are the hazards of the mining industry; the accidents which yearly result in such large losses of

life, and the bad health conditions in many mines and metallurgical plants which affect adversely the vitality of employees. None of these conditions are met with in agriculture, but they are in a peculiar way characteristic of the mining industries; and these conditions alone more than justify this additional call upon the Federal Treasury.

PROPOSED MINING EXPERIMENT STATIONS.

The bill authorizes and directs the Secretary of the Interior "to establish and maintain in the several important mining regions of the United States and the Territory of Alaska 10 mining experiment stations." It is expected that these stations will be mainly in the public-land States. The exact location and the question of their being removed from time to time from one point to another is wisely left to the discretion of the Secretary of the Interior in order that the work of the several stations may be carried on at such places and in such manner as will best facilitate the metal mining resources of the country.

There are located within the boundaries of the several public-land States large bodies of low-grade ores of different types for the efficient treatment of which there are no known methods. There are other large deposits that are being worked in accordance with methods that are highly wasteful of valuable mineral products. On the public lands in these States there are many mineral deposits concerning the value of which little is at present known. These and other associated problems, general in character, will be investigated by the several mining experiment stations to be established in such regions; and it is believed that the results of such investigations will be not only beneficial to the industry but also to the general public.

RELATIONS OF THE WORK OF THE MINING EXPERIMENT STATIONS TO THE WORK UNDER THE GENERAL APPROPRIATIONS OF THE BUREAU OF MINES.

It has been suggested that the work authorized for the several mining experiment stations to be established under this legislation might be carried on under the general appropriations for the Bureau of Mines. If these appropriations were sufficiently ample and stable, an arrangement of the kind suggested might be possible under the existing organic act of the Bureau of Mines, in the same way that the Department of Agriculture a few years ago might have established a series of agricultural experiments in each of the several States. But Congress at that time decided—and no doubt wisely—that with a view to giving such work a more stable basis and a more ample support it were better by formal act to establish agricultural experiment stations in each of the States and Territories, for each of which an appropriation of $30,000 per annum has been authorized.

The Committee on Mines and Mining, after a careful consideration of this question, has decided that it will be unnecessary to establish so large a number of stations for the work in mining as was done in the case of agriculture, but, nevertheless, that there should be at least 10 such stations established and maintained through an appropriation of $25,000 for each such station, in order that the local interests of the more important metal mining regions in the public-land States might receive ample and continuous consideration.

COOPERATION OF THE STATES IN THIS WORK.

Section 2 of the pending bill authorizes the Secretary of the Interior "to accept lands, buildings, or other contributions from the several States offering to cooperate in carrying out the purposes of this act." It is considered wiser that the act should not make the cooperation of any State a condition of this appropriation, nor was such condition imposed upon the States in the making of the appropriation for agricultural experiment stations It is practically certain, however, that in mining, as in agriculture, the interested States will cooperate, and will cooperate liberally, with the National Government in carrying forward this important work.

In support of the agricultural colleges in the several States the appropriations by the States themselves are now many times larger than those by the Federal Government; and in the maintenance of the agricultural experiment stations established by the National Government in each of the States and Territories the appropriations by the States and Territories for 1912 were $1,250,000 as against an appropriation of $1,545,000 from the National Treasury.

It is believed that under the bill as reported the Secretary of the Interior will be able to locate the 10 mining experiment stations and the headquarters of the 15 mine safety stations, or rescue cars, at such points as will best serve the needs of the industry and the country, and that in doing this he will be able to secure the liberal cooperation of the several mining States in the maintenance of these stations.

The following letter from the Secretary of the Interior throws light on several phases of this legislation, though it relates especially to the proposal for the establishment of the 10 mining experiment stations:

DEPARTMENT OF THE INTERIOR,
Washington, January 15, 1914.

Hon. M. D. FOSTER,
Chairman Committee on Mines and Mining,
House of Representatives.

MY DEAR DR. FOSTER: Replying to your letter of December 2, which asks for an expression of opinion concerning H. R. 1646, a bill to establish a mining experiment station in the State of Colorado and for other purposes:

There is also before me a number of similar bills for the establishment of mining experiment stations in other Western States, some of which have already received the approval of this department.

Instead of proceeding with the consideration of the special bill now submitted (H. R. 1646), I beg to report that the general policy and purpose of these several bills, viz, the establishment of experiment stations in public-land States looking to the safer and more efficient development of the mining industry in these States meets with my hearty approval and commendation.

I would suggest, however, instead of submitting to Congress a number of separate bills for the establishment of individual stations in specified localities, the adoption of the following general policy:

That there be prepared a single bill which would authorize the establishment in the public-land States and in the Territory of Alaska, on a basis in a general way similar to that indicated in the bill under consideration, of 10 mining experiment stations, these to be located at such points in these States and in the Territory of Alaska as would best facilitate the efforts of the Government in behalf of the proper development of the resources on the public lands and the less wasteful development of the mining industry in these public-land States.

There are more than 20 public-land States and the Territory of Alaska in which the mineral resources, and especially the metalliferous resources, are sufficient to constitute an important factor in our future national development. My reason for recommending this much smaller number of mining experiment stations (10 in all) is that in the development of the mining industry we do not have to contend with the varying climatic conditions found in the many different States, and it does not, therefore, seem to me necessary to establish mining experiment stations in each of these States, as has been done in the case of agricultural experiment stations. Nevertheless, we do have marked differences not only in the nature of the mineral resources but also in the conditions under which they must be developed; and the distances between mineral districts in the western half of the United States are so great that I think this number of stations, properly distributed throughout this great region, will be necessary for the proper economic prosecution of the work.

My reason for recommending that the exact location of each of these stations be left for determination at a subsequent date by the Secretary of the Interior is that this arrangement will make possible such distribution of the stations as will not only be most suitable to the proper development of resources but will also make each station better supplement the work of each other station in carrying out the general purposes of this legislation.

In recommending the establishment of these stations in the public-land States, without, at this time, recommending the establishment of such stations in other parts of the country, the department is perhaps influenced by the fact that in these public-land States the Government is itself greatly interested in the proper development of the mineral resources in these lands; and owing to the large area of public land in these States which is nontaxable, these States are less able financially to provide for such investigations than would otherwise be the case.

For a number of years Congress has been appropriating annually for the maintenance of experiment stations in behalf of agriculture in the several States an aggregate sum of nearly $1,500,000. In addition to this, in the public-land States the Federal Government has expended during the past 12 years $77,150,180 in the reclamation work of making available additional agricultural lands; and of this sum more than $8,000,000 has come from the proceeds of the sale of mineral lands in the public-land States.

I mention these expenditures with no feeling other than that of approval; but in passing, I may call attention to the fact that the mining industry in this country does not appear to have had a square deal in the way of public recognition and aid. And in speaking of the mining industry, we need not especially concern ourselves about the profits of the few large mining companies. There are the many thousand small mine owners and prospectors struggling with difficult problems, there are the safety and welfare of the 2,000,000 employees in the various mining and mineral industries, and there are the other great national problems of waste in these industries, all of which should have our serious concern, and should have also the benefit of extended national inquiry and scientific investigation.

It would seem, therefore, that the annual appropriation necessary for the maintenance in the public-land States and in Alaska of these 10 mining experiment stations is not only a reasonable proposition but that it represents only a small part of what the Federal Government should do for the safer and more efficient development of the mining industries of this country.

Very truly, yours,

FRANKLIN K. LANE.

THE NEEDED ENLARGEMENT OF THE MINE RESCUE-CAR WORK, THROUGH THE ESTABLISHMENT AND MAINTENANCE OF 15 MINE SAFETY STATIONS.

The continuance of large mine disasters and the increase of mine fatalities during the year 1913 as compared with the preceding year have brought from the country a demand for greater effort by miners and mine owners in carrying out reform measures for a more exacting inspection and police supervision by the States, and for such a reorganization and enlargement of the facilities of the National Government as will carry forward its investigations more rapidly and result in a better safeguarding of the lives of miners and an improvement in the health conditions which prevail in many of the mining, metallurgical, and other mineral industries.

PLAN PROPOSED IS RESULT OF A SERIES OF CONFERENCES.

This reorganization and enlargement of urgently needed reform measures is the net result of a series of conferences among representatives of the miners, mine operators, and State mine inspectors. At these conferences there was a careful consideration and discussion of the many phases of a greater mine safety problem as related to the work of each of these agencies. It was the general opinion that the failure of the National Government to press various investigations to a conclusion was retarding the mine safety movement.

The committee has carefully considered the situation and is of the opinion that the plan proposed in this bill for the enlargement of the equipment and operations of the Bureau of Mines is a necessary feature of any general plan to bring about more rapid progress in the prevention of mine accidents and in the improvement of health conditions in the mining and metallurgical industries. In any general movement for greater mine safety the Federal Government must bear its share. This plan does not represent the conclusion of any one person, but is rather the consensus of opinion of persons familiar with the situation, and it is believed by the committee to be urgently called for at this time.

MINE SAFETY WORK OF THE NATIONAL GOVERNMENT AND ITS RELATION TO THAT OF THE STATES, MINE OPERATORS, AND MINERS.

The following plan of cooperation in mine safety work in this country has been discussed at these several recent conferences and has met with general acceptance as being in accord with existing law and custom. It is believed that this plan can and should be made more effective in the immediate future through the greater activity and hearty cooperation of the interested parties. The plan is as follows:

"1. That the National Government shall conduct on a larger scale the necessary general inquiries and investigations, and that it shall promptly disseminate the information obtained among the miners, mine owners, and mine inspectors, in such manner as will prove most effective in bringing about the needed reforms in preventing mine accidents and in improving health conditions.

"2. That each of the several mining States shall enact the needed improvements in legislation, and shall make ample provision for the proper inspection of the mines and the proper enforcement of the mining laws and regulations within their borders.

"3. That the mine owners or mine operators shall install and maintain improvements which give reasonable promise of greater safety and better health conditions as rapidly and as completely as the practicability of such improvements may be demonstrated by inquiries and investigations which the Bureau of Mines is conducting.

"4. That the miners and mine operators shall cooperate both in making and in enforcing such rules and regulations as their own experience

and as the investigations and inquiries in this and other countries show will aid in carrying out the purposes mentioned, especially such as will best safeguard the lives of the men who work underground."

THE WORK OF THE NATIONAL GOVERNMENT IS FURTHEST BEHIND.

Of the work of these four agencies in behalf of mine safety, that of the Bureau of Mines is most backward. It should, however, be in the lead. The State mine inspectors, mine operators, and miners have of late, through their growing interest in the safety movement, presented to the Bureau of Mines a larger and larger number of inquiries or appeals for information upon which to base their own activities. Such information is being sought for use as a basis for improved legislation in the States, or for a more rigid inspection of mines, or as a basis for better rules and regulations to be drawn up by the miners and mine owners. Improvements along all of these lines are being delayed because of the inability of the bureau to push a variety of its investigations to completion, and thereby supply the information needed.

Therefore the claim frequently set forth of late by the miners, mine owners, and inspectors, that the entire mine safety movement is being held back by the lagging of the bureau's investigations, is unfortunately a true and reasonable claim.

THE MINE SAFETY WORK OF THE STATES, MINERS, AND MINE OPERATORS.

The work of the States in carrying out their part of this general program in mine safety is being carried forward in a reasonably satisfactory manner. The States are already expending in their inspection and police-supervision work more than the Federal Government is expending in all of its investigations in behalf of mine safety. Thus, for example, a single State, Pennsylvania, maintains a well-organized and efficient inspection force which includes a chief and 50 district inspectors; it expends in the maintenance of this work $213,000 per annum, paying its district inspectors an average compensation of $3,000 each in addition to traveling expenses. All of the other coal-mining States maintain a system of inspection.

Many of the mine operators have inaugurated a system of operations in which the question of safety is considered of first importance. Something more than 170 mining companies (out of a total of some 3,000 large coal-mining companies and 12,000 smaller coal-mining companies) have individually, or through the association of two or more companies, established 76 mine rescue stations at which there have been installed some 1,200 sets of artificial breathing apparatus besides the auxiliary equipment for first-aid and fire-fighting work. There are also 12 mine rescue cars now operated by individual mining companies about their own local properties. The Bureau of Mines is endeavoring to stimulate such activity by private companies.

The miners are also taking up the work of safety and are appointing safety committees for the more active promotion of the movement; especially is this true in regions which have been visited by the Government mine rescue cars.

The representatives of the States, the mine operators, and the miners are all cooperating with the Bureau of Mines in this safety work, and this cooperation should, from year to year, become a more and more important factor in the progress of the safety movement. But the movement is yet in its infancy, and has reached but a few of the 2,300,000 employees in the industry.

WORK OF THE NATIONAL GOVERNMENT FOR MINE SAFETY AND WHY IT SHOULD COOPERATE IN THIS WORK.

The question as to whether the National Government should contribute to the advancement of its basic industries was settled affirmatively long ago. Congress is now appropriating for the advancement of agriculture, the more important of the two great basic industries, nearly $30,000,000 per annum, and its program of good work includes educational and experimental or research features and general inquiries.

More recently, and on a smaller scale, Congress has inaugurated a series of inquiries and researches looking to the advancement of the other of its two great basic industries—mining. When it is remembered that in mining we deal with serious occupational hazards and with resources of which we have but the one supply, and that this one supply is not only limited but is consumed or destroyed in use, it will be seen that there are special reasons why the mining industry should be treated with a liberality at least equal to that applied to agriculture.

The work of the National Government for mine safety consists mainly in general inquiries and investigations applicable to the conditions in all the States and in which all States are interested. It seems reasonable that this general work should be done by the National Government for the following reasons:

1. It is unreasonable to expect any one State to bear the cost of this work, which is equally useful to all of the other mining States, and in which all the people in all the other States are directly or indirectly interested.

2. If such work were done by each of the several States, the result would be a serious duplication of cost and effort and with varying results. If it were done by the private mine operators there would be still greater duplication and still greater variation in the results, and both the public and the miners would be suspicious of the results obtained.

3. By whatever agency the work may be done, the consumer of coal and other mineral products, representing the citizenship of the entire country, will bear the cost.

It will therefore seem proper that this general work should be conducted by the National Government, under such conditions as will command maximum public confidence and represent minimum duplication of labor and costs.

Furthermore, it is easier for the Federal Government than for the individual States or private companies to obtain information embodying the results of similar inquiries and investigations both in the United States and in the different foreign countries where mining operations are carried on.

EXISTING MINE RESCUE CARS AND STATIONS.

During the past few years the Bureau of Mines has been maintaining and operating during portions of each year six mine rescue stations and eight mine rescue cars, all of these being considered largely as an agency for the dissemination of information among the miners and those in charge of the management of mines and for the training of miners in mine rescue and first-aid methods. This has been primarily an educational work, though in connection with it a large amount of valuable data on mine conditions has been collected.

In order to carry forward this cooperative work in a proper manner it will be necessary to reorganize and to enlarge the work of the mine rescue cars or movable stations to a considerable extent.

EXISTING MINE RESCUE STATIONS.

The six stations maintained and operated by the Bureau of Mines during the last few years have been located at the following points:

Pittsburgh, Pa., occupying War Department buildings assigned temporarily for the use of the Bureau of Mines.

Knoxville, Tenn., occupying rooms in the Federal building. This station will be transferred to Jellico, Tenn., in the heart of the coal fields.

Birmingham, Ala., occupying a building erected by the Bureau of Mines on a site donated to the Government for this purpose.

Urbana, Ill., occupying rooms supplied by the State University.

McAlester, Okla., occupying temporarily a building constructed by the local miners and mine operators of the district, cooperating.

Seattle, Wash., occupying a building on the State University grounds that was erected for the Philippine exhibit at the Seattle Exposition.

Each of these stations has been in charge of a foreman miner, whose special business it was to give training and instruction in mine rescue and first-aid work to such miners as came to the station for such training. When there are no miners applying for training at the station, the foreman miner in charge is authorized to visit the near-by mines and give instruction at the mines themselves, taking with him the equipment—usually one-half dozen helmet outfits and material for first-aid instruction kept at the station for training purposes. In case of a mine disaster in any of the coal fields near a station the foreman miner takes his rescue equipment to such mines and, with the aid of men trained by him in the immediate vicinity, renders such service as he can in connection with the rescue of the injured or imprisoned miners.

RELATIVE EFFECTIVENESS AND COST OF MINE-SAFETY CARS AND FIXED STATIONS.

The average yearly cost of maintaining the existing fixed mine rescue stations has been about $3,200 per station. The average yearly cost of operating a mine rescue car under the existing inadequate system has been about $7,000 per car.

In relative effectiveness—that is, as a means of disseminating information and awakening interest and cooperation among the miners in the mine-safety movement—the advantage is greatly in favor of the rescue car, for the reason that the work is carried on at the mines, where all the miners and mine officials can see it in progress and cooperate in the movement and where the miners who are willing to take special rescue and first-aid training can do so without loss of time from their mining work or incurring expenses of travel and board elsewhere.

For this reason it would be well to discontinue the operation of such fixed mine rescue stations as are not located in the center of a thickly settled mining population and have their work carried on by rescue cars or movable stations. It is, however, considered advisable to maintain certain fixed stations which are so located, such, for example, as those at Birmingham, Ala., and McAlester, Okla., and the two new stations at Jellico, Tenn., and Norton, Va. These five fixed stations, already provided with buildings, can each be operated within its restricted sphere without being considered a part of the pending legislation.

EXISTING RESCUE-CAR WORK.

The mine rescue cars are distributed as follows:

Car No. 1, anthracite coal field, Pennsylvania, headquarters at Wilkes-Barre, Pa.

Car No. 2, Colorado-New Mexico coal fields, headquarters at Denver, Colo.

Car No. 3, Indiana-Kentucky coal fields, headquarters at Evansville, Ind.

Car No. 4, Kansas-Missouri-Oklahoma coal fields, headquarters at Pittsburg, Kans.

Car No. 5, Montana-Washington coal fields, headquarters at Billings, Mont.

Car No. 6, Wyoming-Utah coal fields, headquarters at Rock Springs, Wyo.

Car No. 7, West Virginia-Virginia-east Kentucky coal fields, headquarters at Huntington, W. Va.

Car No. 8, Lake Superior iron and copper districts, headquarters at Ironwood, Mich.

One car (No. 8) is devoted to work in the metal-mining fields.

The cars are out-of-date wooden Pullman coaches, purchased from and refitted by the Pullman Co. to meet the special needs of the Bureau of Mines work, after they had been removed from the regular service because of age and wear. In refitting these cars for the mine rescue work of the bureau one-half of each car is arranged with small rooms containing office headquarters, certain equipment, and spaces for heating, cooking, eating, and for sleeping berths. In the other one-half of the car the lower Pullman berths have been removed and the entire space is taken up with mine rescue and first-aid equipment. The upper berths have been retained, and are used as additional sleeping places for the men connected with the work, and especially for the extra men who, in the absence of other accommodations, may be housed on these cars in times of mine disasters.

The average cost of the seven existing cars—which have no steel underframe—including their refitting, has been about $1,750 per car, this representing mainly the cost of refitting the cars; but the cost of repairs has been heavy, ranging from $500 to more than $1,000 per car per year, in order to keep them in a reasonably safe condition for travel on the road. Railway officials now advise, as being necessary to safety, that all these cars be overhauled and that steel underframes be substituted for the existing weakened and aged wooden underframes.

The average cost of the inadequate equipment on these cars has been about $2,380 for each car.

PERSONNEL, EQUIPMENT, AND OPERATION OF EXISTING RESCUE CARS.

The personnel of the rescue cars in operation during the past few years has been, on each car, two miners, one to give training and demonstrations in the use of breathing apparatus and other life-saving equipment, and the other to train miners in first-aid methods, and a cook-janitor to take care of the car and its equipment and to supply the meals for the miners and himself.

The equipment of each rescue car has comprised 8 to 12 sets of artificial breathing apparatus, together with the supplies used in the mine rescue training and demonstrations and the first-aid training and demonstrations, extra supplies of oxygen and other materials used in the demonstration work and in actual mine rescue work at mine disasters, a limited quantity of fire-fighting apparatus, and sets of ordinary tools to be used in case of repairs on the car or in repairs rendered necessary in portions of the mine.

The operations of each rescue car may be considered as divided between the work in connection with mine disasters and ordinary preventive educational work.

PREVENTIVE EDUCATIONAL WORK OF EXISTING RESCUE CARS.

Under normal conditions each car is expected to be traveling from one mine or group of mines to another in a given coal field. The car stops at a given mine or group of mines for a week or ten days. During this time the two miners give a number of general demonstrations of mine rescue and first-aid methods; and in addition to this they train from five to ten men at each mine or group of mines in rescue methods and usually a larger number of men, often two or three times as many, in first-aid operations.

Whenever it has been possible, as has been the case at occasional intervals, that a mining engineer could accompany the car, in addition to the demonstration work mentioned above, the mining engineer has given a number of public addresses to the miners and the managers of mines, illustrated with lantern-slide pictures, with inscriptions under each picture in different languages, showing in contrast the more dangerous and the safer methods of mining. In the work as it is proposed to enlarge it there will be a mining engineer with the car all the time; and in addition to the lectures and demonstrations he will make examinations into the mining conditions and advise the mine officials on the ground as to possible improvements. The mine surgeon will do the same as to mine sanitation and other health conditions.

WORK OF EXISTING CARS AT MINE DISASTERS.

While the rescue work of the cars is unquestionably important, the committee believes that the preventive educational work carried on by these cars is of still greater importance as a means of helping to prevent mine disasters. The aim of the educational work is to supply miners, mine foremen, fire bosses, and other mine employees with information concerning the latest safety methods and appliances, and to interest them and to secure their cooperation in the general movement for mine safety and better mining conditions.

When a mine disaster occurs in any coal field the rescue car nearest the mine disaster is carried to the scene of the disaster as quickly as possible by the first passing train or by a special locomotive. When it arrives, the two miners with the car, subject to the authority of the State officials, enter at once upon the rescue work at the mine, and they call into service to cooperate with them such additional miners in the vicinity as they may have already trained in rescue methods. In case of a large mine explosion, the two nearest mine rescue cars may be ordered to the scene of the disaster. Generally they are met there by two or more of the mining engineers of the bureau experienced in rescue work and whose business it is to examine into the nature and extent of the mine disaster, as soon as possible after the disaster occurs.

CONTRAST BETWEEN THE OLD AND PRESENT MINE RESCUE METHODS.

Under the system now being practiced in this and other countries, the pioneer work in entering the mine, while still perhaps full of wreckage and poisonous gases, is being done by men of a specially organized force wearing, as may be necessary, artificial breathing apparatus, and carrying with them as precautionary measures safety lamps and small animals (usually birds), which are used for detecting the poisonous carbon monoxide, known as "white damp" by the miners. As rapidly as the ventilation of the mine can be restored, these trained men with artificial breathing apparatus are followed by experienced miners who, while taking every precaution, do not need to wear artificial breathing apparatus.

In connection with the organized system of rescue work along these lines during the past few years, some 80 men have been rescued from the mines by the trained men of the bureau, and some 500 miners have been rescued by other parties, many of these other parties having been trained in rescue methods by the men connected with the bureau.

This well-organized rescue work is in marked contrast with the older rescue methods in force a few years ago. This is illustrated by the experience at a Wyoming mine disaster in 1909 at which 40 miners lost their lives in an unorganized effort to rescue 20 miners caught in a mine explosion a few hours before.

THE NEEDED EXPANSION OF THE MINE SAFETY-CAR WORK.

Each of the seven rescue cars operated in the coal fields during the past three years has been kept in operation during an average of five to six months each year, the full time that the cars could be operated with the funds available. Furthermore, it has not been possible to keep on each mine rescue car either a mining engineer or a surgeon, and for this reason not only has the work of the car been restricted in time but also restricted in effectiveness.

The experience during the past few years has shown that several of these cars were at the time of their purchase already too badly worn to permit of their being used for extended journeys, and in the case of several cars the cost of the repairs has already exceeded the original cost, so that even the present work can not be continued without the overhauling and repair of the cars now in the service.

Moreover, as regards several of the cars, although the railway companies have been willing to handle them on slow trains they have not considered it safe to handle these same cars on fast express trains, although, of course, speed is highly desirable in time of serious mine disasters.

Railway officials have therefore recommended that all of the existing rescue cars, except car No. 8 (which was so treated at the time of its original purchase), should have steel underframes substituted for the wooden underframes which these old cars now have, and should be subjected to a thorough overhauling and repairing before being placed in service. They also recommended that in the purchase of new cars in connection with the proposed extension of this work, all of these new cars should have steel underframes. These changes are regarded as being necessary, not only for the safety of the cars themselves and the men traveling with them, but also to prevent the wrecking of the trains to which these cars are attached.

The enlargement of the work should take place along the following lines:

(1) Each of the eight existing mine rescue cars should be thoroughly repaired, and as a part of such repairs each of the seven cars now having old wooden underframes should be given a steel underframe.

(2) The equipment for each of the existing cars should be thoroughly overhauled and repaired and increased in quantity, so that in addition to the ordinary equipment required for the training and demonstration work there would be certain new equipment kept in the best possible condition for the hazardous work attending mine disasters. Among other items of equipment there should be special facilities for hoisting (a few men at a time), fire fighting, etc., for use when the ordinary equipment of the mine may be destroyed or so badly damaged as to be temporarily out of commission.

(3) There should be added to each car a mining engineer, a mine surgeon, and a stenographic clerk. (The duties of and need for each of these is stated below.)

(4) The total number of cars should be increased from 8 now in hand (7 in the coal fields and 1 in the metal-mining regions) to 15, through the purchase of 7 additional cars. Thirteen of these cars should be operated in the coal fields and two in the metal-mining regions.

(5) Each of these cars should be operated for a period of 11 months. The thirteenth car would be operated as a relief car for the other 12 in the coal fields, replacing 1 of the 12 cars during each succeeding month. Under such a system, in the coal fields, 12 cars with full crews would in this way be actually in full operation for the entire year. The 2 cars assigned to the metal-mine regions should each be operated for 11 months.

(6) There should be a headquarters organization located at some central point, probably at the Pittsburgh laboratories, under the general direction of which all of the cars could be operated. Here the necessary researches could be conducted, looking to the improvement of rescue equipment, together with the repairs of such equipment; and such other work could be done as would contribute to the efficiency of the entire work connected with such central organization. There would be a chief surgeon and a chief mining engineer who, in addition to guiding the work of the several mining engineers and surgeons on all of the mine rescue cars, would follow up their work by suggestions and cooperation in the organization of local first-aid teams at the different mines, and encouraging the reading of miners' circulars and other publications sent out by the bureau. Engineers connected with this central organization should also visit each mine a few weeks or months subsequent to the visit of the mine rescue car, with a view to seeing that the new interest in safety measures, occasioned by the work of the rescue car, is kept alive.

DUTIES OF THESE ADDITIONAL MEN, AND WHY NECESSARY.

The mining engineer will have charge of the car operations. He will arrange for and will join in giving the public demonstrations and illustrated addresses to be attended by all of the miners of the particular region where the car may stop. He will make a careful examination of each mine as to its safety conditions and will suggest possible improvements in equipment and methods. He will submit to the Bureau of Mines reports of all operations of the car, and more especially as to safety conditions and possible improvements at each mine or group of mines. His recommendations will be taken up with the mine owners, with a view to securing their adoption. The services of an experienced mining engineer in charge of the work of each of these cars is of evident importance. Indeed, it may be regarded as essential to success.

The mine surgeon or sanitary engineer will make a medical examination of all the miners who may apply for training. This requires skill and experience. No miner should be accepted for rescue training who is not physically sound. The surgeon will himself superintend the training in first aid to the injured. Many physicians have protested against the former practice of the Bureau of Mines of having this training done by miners.

The mine surgeon will also make a careful examination into the health conditions in and about the mines, and will submit recommendations in behalf of such improvements to the mine management. This he will do on a basis of cooperation between the Bureau of Mines and the Public Health Service. He will give general illustrated lectures to the miners and other mine employees on possible improvements in health conditions. He will submit reports to the Bureau of Mines in connection with all operations relating to the examination and training of the miners and the examination of and possible improvements in the health conditions in and about the mines. At mine disasters the surgeon will aid in reviving the rescued miners, a work in which extended experience and skill is needed.

The stenographic clerk will assist the mining engineer and the mine surgeon in recording their examinations and inquiries and in the preparation of their reports to the Bureau of Mines and to the mine management. Inasmuch as the mining engineer, the mine surgeon, and the two miners will generally be absent from the car during the time of making their examinations and doing their training work, the stenographic clerk will at such times be in charge of the car, explaining its operations to visiting miners and mine operators, and will look after the instruments and other equipment kept on board the car. This work of the stenographic clerk would greatly increase the efficiency of all the other men on the car, and would give the bureau such records of the work and of mining conditions as would not be otherwise obtainable.

Of the two miners, the foreman miner will carry out the training in connection with the mine rescue work and the first-aid miner that in the first-aid work, both under the supervision of the mine surgeon. In time of mine disasters both these miners will be expected to take part in organizing and leading the rescue work in the mines.

DO RESULTS ALREADY OBTAINED WARRANT THIS EXPANSION OF THE WORK?

This question may be answered in the affirmative without hesitation if the entire situation is considered. Some evidence of past improvement is shown by the accompanying statistical data, although the improvement is neither decisive nor regular. However, in the examination of these data the following facts should be understood:

(1) That the safety investigations of the Government since their inauguration in 1908 have been limited almost entirely to a study of mine explosions (which cause less than one-fifth of our total coal-mine fatalities); and in these explosion investigations the bureau's experimental coal mine—in which its most important experiments are to be conducted—was not ready for satisfactory work until 1913. Meanwhile the requests for funds with which to study, investigate, and develop preventive measures in connection with other and even more important causes of mine accidents have unfortunately had little response.

(2) Every year our mining operations enlarge, the number of men working in individual mines increases, and our coal mines become deeper and naturally more hazardous from increasing gas, falls of roof, machinery, and other conditions associated with greater depths and pressures. Therefore, unless suitable safety improvements are devised and utilized, the death rate in our mines will increase even faster than our mineral production.

The tabular statement given below will indicate some of the important facts relative to the loss of life in the coal mines of the country during the past 12 years. Taking the average death rates for the six years, 1902–1907, inclusive, prior to the inauguration of the Government's investigations of mine explosions, and comparing these with the

averages for the six years 1908–1913, inclusive, since the inauguration of these investigations, it brings out the following facts:

Average number of men killed in the coal mines of the United States per 1,000 employed:
1902 to 1907, average for five years 3.71
1908 to 1913, average for five years 3.73
Number of men killed in the coal mines of the United States per 1,000,000 short tons of coal mined:
1902 to 1907, average for five years 5.88
1908 to 1913, average for five years 5.38
Production of coal in the United States, in short tons, per fatal accident:
1902 to 1907, average for five years ..... tons... 172,000
1908 to 1913, average for five years ..... do... 188,000

Production, number of men employed, and number of men killed in and about the coal mines in the United States in the calendar years 1902 to 1913.[1]

Year.	Production (short tons).[2]	Number employed.[2]	Number killed.			Production per death (short tons).
			Total.	Per 1,000 employed.	Per 1,000,000 short tons mined.	
1902	296,687,066	510,437	1,895	3.71	6.39	156,563
1903	345,200,166	547,431	1,752	3.20	5.08	197,317
1904	339,164,812	573,373	2,004	3.50	5.91	169,244
1905	386,379,243	615,628	2,232	3.63	5.78	173,109
1906	407,835,003	631,085	2,116	3.35	5.19	192,710
1907	461,406,023	655,418	3,197	4.88	6.93	144,325
1908	404,932,764	672,794	2,449	3.64	6.05	165,346
1909	460,761,427	666,523	2,668	4.00	5.79	172,699
1910	501,506,378	725,030	2,840	3.92	5.66	176,618
1911	496,221,168	728,348	2,719	3.73	5.48	182,501
1912	534,466,580	722,662	2,360	3.27	4.41	226,469
1913	[3] 570,000,000	[3] 728,355	[4] 2,785	3.82	4.88	204,688

[1] The figures for production and number of men employed are from Mineral Resources of the United States, U. S. Geol. Survey, except for the number of men employed in 1911, which were compiled by the Bureau of Mines.
[2] These figures represent the production and the number of men employed in those States in which records of fatal accidents are in existence. The figures are directly comparable with the number of men killed as given in the fifth column and are those on which the mortality rates are based. It will be noted that the portion of the industry not represented in the rates from 1902 to 1909 is small and that since 1909 the entire industry is represented.
[3] Estimated. Subject to revision.
[4] Does not include December fatalities in Kentucky.

Average number killed per 1,000 employed in the coal mines of the principal coal-producing countries for the 10-year period 1901 to 1910.

	India.	Belgium.	Austria.	Great Britain.	France.	New South Wales.	Germany.	Japan.	United States.

Average number killed per 1,000,000 short tons of coal mined in the principal coal-producing countries for the 10-year period, 1901 to 1910.

	New South Wales.	Great Britain.	Austria.	Belgium.	United States.	Germany.	France.	India.	Japan.
Average, 1901–1910	3.70	4.40	5.05	5.56	5.83	7.55	7.79	9.00	22.71

Safety work by the Bureau of Mines in metal mining in the United States has been limited to the past two years (1912 and 1913). The year 1911 is the latest for which metal mine accident data are available for other countries. The data for this one year will serve to indicate the relatively high death rate in the metal mines of the United States and other countries.

Country.	1911		Country.	1911

(3) Among the more specific safety improvements that are being developed and are now being introduced in coal mining under the lead of the Bureau of Mines are: (a) A new type of quick-flame, low-temperature explosive much safer than black powder for use in gaseous and dusty mines. There are now 116 different explosives of this new type manufactured by 18 different companies, and there is already in use (1913) more than 25,000,000 pounds of these explosives annually; (b) new types of miners' electric safety lamps and safety electric motors for use in gaseous mines. These and other improvements now underway in connection with safety measures, rescue and first-aid methods, and the general educational work inaugurated in connection with the mine rescue cars and stations during the past three years have won the cooperation of the miners and the mine operators, and the conditions are now favorable to the far larger cooperation of the miners and operators with the Bureau of Mines in its proposed larger work.

Many large mine operators have already put in force safety precautions to such an extent that the death rate in their own mines has been largely reduced, and in this work they have the cooperation of the miners and mine inspectors.

It should be remembered, also, in this connection that the mine rescue car work has as yet reached only a small percentage of even the coal miners of the United States. But there is much evidence going to show that the miners and other mine employees who have attended the illustrated lectures and demonstrations given in connection with the work of the rescue cars have exhibited a much greater interest in the mine safety work of the bureau, have called for its publications in increasing numbers, and in other ways have shown a willingness to cooperate with the bureau and with the inspectors and mine operators in putting safety appliances and methods into practice.

The condition which, more than any other, is retarding progress in this great safety movement is the failure of the National Government to make adequate provision for the more rapid extension of its research and educational work. Miners and mine operators agree in commending the thoroughness and effectiveness of the work of the Bureau of Mines as far as it has been able to go, and in expressing their willingness to accept and act upon its advice and recommendations, but they complain of the long delays and of serious limitations in this work; and the lack of conclusions and of specific recommendations as regards many possible improvements in safety and health conditions is seriously holding back such improvements in all parts of the country.

PROGRESS OF THE WORK UNDER THE PRESENT AS COMPARED WITH THE PROPOSED LARGER OPERATIONS.

A careful estimate shows that at the rate of progress under existing conditions between 12 and 15 years would be required for a single visit of one of the existing rescue cars to each important coal mine or group of mines in the United States. If the enlargement of the work now proposed is carried out in full, a rescue car with its demonstrational and other educational work would visit each important mine or group of mines in the United States once in four years' time, and during this time the training work of these cars would be so extended that from 10 to 30 miners would be trained in rescue and first-aid operations at each important mine or group of mines in the country.

WHY THIS EDUCATIONAL WORK CAN NOT BE CARRIED ON BY PUBLICATIONS ALONE.

A large proportion of the men entering the mines in the United States each year come from the farms and villages of different European countries; they are unfamiliar with our language, our institutions, and our laws, and know little or nothing of mining.

A majority of the men now working in the coal mines of the United States to-day speak and read but little English. It is therefore difficult to reach these men through publications, even when the latter are prepared in the most simple and elementary manner.

The plan followed most successfully by the employees of the Bureau of Mines in reaching and interesting these men is through giving actual working demonstrations in mine rescue, first aid, and other safety measures and methods, and the giving of lectures illustrated with lantern-slide pictures, which contrast the safe and the dangerous methods. Each of these pictures used has a short, one-line description under it in four or more different languages most common among the miners. In these lectures and demonstrations local interpreters are used at intervals, as the need for them may appear.

THIS DEMONSTRATION WORK AWAKENS NEW INTEREST AMONG MINERS, AND IS GOOD WELFARE WORK.

Work of this kind develops a new interest in the safety work among the miners, and following the movements of each of the existing rescue cars this interest on the part of the miners is shown in their call for the publications which treat of the mine-safety work.

So far as it has gone, this educational work is assuredly developing safer and better mining, and the leaders among the miners express the belief that if carried forward on a larger scale and in a more thorough manner, the work can not fail to develop also better citizenship among these miners.

Certainly many miners in different parts of the country have expressed a growing interest in and friendly feelings toward the National Government, as they come to see the evidences that the National Government is interested in their welfare. On the other hand, the great majority of the miners have not yet seen evidences of any public interest in their welfare, and no one need feel surprised at their lack of interest in government. Their chief idea of government—brought with them to this country—is that of suppression or oppression. In the enlargement of the mine-safety work now proposed the National Government certainly has its best opportunity to show to more than 2,000,000 of its citizens that it does have a real and an active humanitarian interest in promoting their welfare; and it can thereby gain their good will.

All this demonstrational and other educational work is of a pioneer character. If the mining conditions of the country can be improved and mining made safer and more attractive, men will stay with the mining industry in this country as they have been doing in other countries, and there would be less need of training a new army of miners each year. It will therefore be real economy to push the work more rapidly now.

There is every reason to believe that such educational work carried forward by the National Government under such methods as to win the confidence and cooperation of the miner will make for real progress in this industry in the same way that the national appropriations for educational work in agriculture have led to improvements and real progress in that industry which are building up a greater public welfare.

COST OF THE PROPOSED ENLARGEMENT OF THE SAFETY-CAR WORK.

The cost of overhauling the eight existing mine rescue cars, of providing seven additional mine rescue cars with their full equipment, and of operating all of these cars throughout the entire year on the basis described above is shown in the tabular statement given below.

Of the eight existing cars, seven will need to be provided with steel underframes to be substituted in each car for the worn-out wooden underframes which they now have, for reasons previously stated. This substitution of the steel underframes, together with the other needed

repairs, will make the overhauling of seven of the existing cars cost about $3,000 per car. One of the eight cars already has a steel underframe, and its overhauling will be inexpensive. The estimates obtained covering the purchase of these additional cars indicate an average cost of about $5,500 per car.

Nearly all of the existing cars when originally constructed as new cars were valued at from $20,000 to $30,000 per car. They were purchased by the Bureau of Mines at from $1,500 to $2,500 each after they had been abandoned for ordinary usage by the Pullman Co.

The cost of repairing cars already in use, of purchasing new cars, and of equipping and operating the cars in accordance with the plan set forth is given in the following statement:

Cost of the cars:		
Repairs of 7 of the 8 existing cars, at $3,000 (providing each with safer steel underframes)	$21,000	
Purchase of 7 additional cars, at $5,500	38,500	
		$59,500
Cost of equipment:		
New additional equipment for 8 existing cars (estimated for in sundry civil bill, $30,000; if not incorporated in sundry civil bill, should be incorporated in this estimate), equipment for 7 new cars, at $4,500		31,500
Total cost of cars and equipment		91,000
Cost of operating 1 car:		
Services—		
1 mining engineer	$3,000	
1 first-aid surgeon	2,700	
1 foreman miner	1,800	
1 first-aid miner	1 680	
1 stenographic clerk	1,000	
1 cook and janitor	720	
		10,900
Maintenance—		
Travel of men when absent from car	1,200	
Subsistence of 6 men, at $1 per day on the car, 335 days	2,010	
Repairs to the car and equipment	1,200	
Supplies used in training	4,440	
Special extra material and labor at mine disasters	600	
		9,450
		20,350
Cost of operating in the field 15 cars, at $20,350 each		305,250
Cost of headquarters, organization, and work necessary to successful operation in the field of the 15 mine rescue of mine-safety cars (see par. 6, p. 16):		
1 mining engineer in charge	$4,500	
1 mining engineer in charge of rescue organization work following the car operations	4,000	
1 chief surgeon	4 000	
1 engineer in charge of rescue equipment and methods	3,000	
1 engineer in charge of publications for supplementing rescue and first-aid demonstrations	3,000	
2 special assistants, at $2,400	4,800	
2 mechanicians for rescue equipment, at $1,800	3,600	
2 assistant mechanicians for rescue equipment, at $1,500	3,000	
2 safety commissioners for special organization work among the miners, at $3,300	6,600	
Special expert services for improvements in rescue equipment and methods	6,000	
3 stenographers and typewriters at $1,500	4,500	
2 stenographers and typewriters, at $1,200	2,400	
Travel expenses and subsistence	10,000	
Shop equipment and supplies for rescue equipment, repairs, and improvements	10,310	
		69,750
Total yearly cost of the mine-safety work		375,000
Amount now expended for operation on the existing incomplete and inefficient basis of 8 existing rescue cars during current year (9 months) under the appropriations for mine-accident investigations		70,150

As will be seen from the above tabular statement, the total investment in additional cars and equipment and in the necessary repairs of existing cars and the equipment proposed for these larger operations aggregates $91,000. This is not to be considered an additional appropriation, for the reason that these expenses might be covered in the following manner: It is likely that between two and three months would elapse following the passage of the appropriation act before all the additional cars and equipment and personnel of the various cars could be secured, and therefore that disbursements for operation might be conveniently delayed until three months following the passage of the appropriation act. By this date a three-month portion of the proposed appropriation of $375,000 for the mine rescue work will be saved sufficient to cover the amount of the necessary investment in cars and equipment, and after that date the entire machinery of the enlarged operations would be operated continuously during the remaining nine months.

THE URGENT NEED OF ADDITIONAL MINE-SAFETY INVESTIGATIONS.

The amount to be expended for the operation of the eight existing rescue cars operated on their smaller scale, during seven to eight months of the current year, is estimated to be $70,150. This amount may therefore be deducted from the existing appropriation of $347,000 for mine accidents, but in the opinion of the committee it should be allowed to remain as a part of that appropriation to be expended on long-delayed urgent investigations in relation to other mine safety improvements, which for lack of funds the bureau has not yet been able to take up. These investigations are as follows:

(1) Necessary extension of experimental mine work.—Recent mine explosions render necessary during the fiscal year 1915 an increase in the allotment for the explosion tests in the experimental mine of $15,000 more than the allotment for this work during the current year. The results of the current year's experiments are highly encouraging as to the possible use of stone dust and dry clay as preventive of coal-dust explosions; but they also indicate the need of extending the dimensions of the mine to a considerable extent.

(2) Accidents from falls of roof.—One of these is the falls of roof in mining, which causes from one-third to one-half the total loss of life charged against the mining operations in this country. This is an investigation requiring thoroughly trained technical knowledge. The loss of life from this cause during the last five years in coal mines alone has been more than 6,000 and the seriously injured 18,000 to 20,000.

The situation is not to be remedied by the claim that this class of accidents is due to carelessness. There is often a reasonable ignorance on the part of both the miners and the mine foreman concerning the nature of the roof rock and its behavior under different conditions of moisture and pressure. A thorough investigation of the problems, using both the practical experience of the miner and the technical knowledge of the engineer, can not fail to be helpful.

It has been urged that in this country we should follow the practice of Great Britain, in which country the proportionate loss of life from this cause during the past five years was less than one-half that in the United States. But the adoption of the British timbering practice in all our American coal mines would add $50,000,000 to $75,000,000 yearly to the cost of coal in this country, to be paid by the consumers of coal in all the States.

It is estimated that an investigation during the next few years, costing about $40,000 per annum, would probably find other and far cheaper methods of accomplishing the same result.

(3) Accidents from mine equipment.—The loss of life from mining, haulage, and hoisting machinery, failure of signals, etc., in the coal mines of the United States during the past five years was 2,100 men; and more than 6,000 men were seriously injured. There is serious need of investigation in this subject, which as yet the bureau has not been able to undertake. It is estimated that such an investigation would cost $35,000 per annum.

(4) Accidents (other than explosions) from electricity.—From this cause there have been many deaths and many serious nonfatal accidents in the mines of the country during the past five years. An investigation of this subject has thus far been beyond the means of the bureau, but it should be taken up without further delay. Such an investigation continued during the next few years is estimated to cost about $20,000 per annum.

(5) Accidents (other than explosions) from explosives in mines.—During the past five years about 700 men have been killed and fully 2,000 have been seriously injured from this cause in our coal mines alone. In addition to accidents of this type, a large number of miners have suffered from the poisonous effects of the fumes or gases given off in metal mines and tunnels, where the ventilation is poor. Investigation into this subject to cost $20,000 during the fiscal year 1915 has been estimated for in the sundry civil bill.

(6) Improvements of health conditions in the metal-mining, metallurgical, and other mineral industries.—A comprehensive investigation of conditions affecting the health of workers is one of the urgent existing needs of the mining industry. Such investigation would affect the health condition of one and a half million men employed in these several phases of the industry, and no one familiar with conditions will for a moment question its importance. In conducting it the Bureau of Mines would have the active cooperation of the Public Health Service, which would study the different ways in which mine conditions affect the health of employees, while the Bureau of Mines would seek to ascertain the existence and the causes of bad health conditions and the methods of improving the same. A careful estimate indicates that the cost of the part of this work to be carried on by the Bureau of Mines would be $50,000 a year for the next few years.

The investigations to which attention has been called in the above statements, although possibly the most urgent, are by no means the only ones that should be made by the Government in any systematic and comprehensive attempt to increase safety, improve health conditions, and bring about a more efficient development in the various mineral industries.

SLOW PROGRESS IN THE PAST GOVERNMENT MINE-SAFETY INVESTIGATIONS.

During the past two years, and especially during the past year, many complaints have come from both miners and mine operators of the slowness with which mine-safety results were being obtained through the Bureau of Mines. Both operators and mine owners have shown a desire to inaugurate new improvements looking to greater safety and along any lines in which they could receive definite and satisfactory recommendations or advice; and within the bureau itself every effort has been made to press these inquiries and investigations more rapidly with a view to obtaining these results with less delay, but progress has been unfortunately slow.

In connection with the investigation of mine explosions, owing to the limited funds at the disposal of the bureau it has required three years to open up the experimental mine near Pittsburgh and get the same in proper shape for experimental researches. With more adequate facilities this could have been done within a single year. As another example, three years have been required for certain researches looking toward the development of miners' electric safety head lamps, all of which, with larger facilities, might have been done within a single year. We have found it difficult to give to the miners especially a satisfactory explanation of these delays.

THE ECONOMICS OF MINE ACCIDENTS AND HEALTH CONDITIONS.

No one likes to estimate the money value of a human life, but at times it becomes necessary to do this, especially in working out the economics of compensation acts. It is a reasonable estimate that during the past 10 years more than 30,000 men have been killed and more than 100,000 seriously injured in connection with the accidents in the mining industries of this country. It is impossible to estimate the number who have suffered from bad health conditions in many metal mining, tunneling, quarrying, metallurgical, and other mineral industry plants. It is impossible to estimate the number of men with health shattered through these conditions who have had to give up their work years before their natural time or the number of dependents who have suffered thereby.

If it be assumed that each human life is valued at $3,000, it will be seen that the deaths alone in the mines have cost in the 10 years $90,000,000.

If each of the 100,000 seriously injured lost 20 days at $3 per day, a reasonable assumption, this represents $6,000,000 lost from this cause.

As to the metal mines, metallurgical plants, and quarrying operations, unfortunately there are few reliable data regarding health conditions in the United States; yet there are sufficient isolated figures concerning certain districts to indicate that the death rate from occupational diseases is even greater than the accident rate.

Whatever may be the value put upon a human life in arranging for a reasonable compensation, these losses of life and labor are national

in their extent and character and fall ultimately upon the general public as representing the consumers of mineral products. Whatever the theoretical bases of value of these losses, the true cost falls directly upon the injured and upon the consumer. Also, whatever additional expenditures may become necessary on the part of the operators of mines and metallurgical and other mineral industry plants to reduce this loss of life and labor must ultimately be a charge upon the general public as representing the consumers of mineral products.

It is important, therefore, not only from the humanitarian standpoint, but also from the standpoint of economics, that everything possible should be done to reduce the loss of life and labor in the mining industry both through prevention of accidents and through the improvement of health conditions. It is also a matter of decided importance to the general public from both the standpoints that these improvements should be brought about at a minimum cost and in a minimum time. Real economy involves speedy accomplishment as well as efficiency in the improvements to be made.

It is important, therefore, from both the humanitarian and economic standpoints, that the investigations by the National Government, with a view to better safeguarding the lives of the men connected with the more hazardous branches of the mining industry, should be conducted as thoroughly and as rapidly as the work can be done effectively, in order that the improvements may be inaugurated without delay and to the fullest possible extent.

It is equally important that after the inquiries and investigations have been conducted and reasonable conclusions formed, the information should be disseminated promptly and effectively among the miners and those who manage the mines.

The committee unanimously recommends the passage of the bill.

Antitrust Bill.

SPEECH

OF

HON. WILLIAM M. CALDER,

OF NEW YORK,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, May 26, 1914.

The House in Committee of the Whole House on the state of the Union had under consideration the bill (H. R. 15657) to supplement existing laws against unlawful restraints and monopolies, and for other purposes.

Mr. CALDER. Mr. Chairman, in recording my opposition to the measure now before the House, H. R. 15657, known as the Clayton antitrust bill, I wish to speak particularly in behalf of the business man of small means, whose opportunities will, I believe, be greatly injured if it should become a law. I shall call attention to one or two features of the bill which, in my judgment, will have a disastrous effect not only upon the small business man but upon the large business man as well.

Recently I was advised not to attempt to give my views on this subject because of the fact that a Representative from the city of New York expressing opposition to this measure would actually aid in its passage. I do not consider that, even if true, a sufficient reason why the business interests of New York should remain unrepresented on the floor of this House. They are entitled to the same consideration and the same voice as the business interests of any other section of the country. They include the small business man as well as the large one, the laboring man as well as the employer. They can not be ignored in the preparation or passage of any legislation which affects business.

I have carefully examined the Clayton bill and wish to here and now record my objections to it. The Hepburn Act and the amendments thereto have already given the Interstate Commerce Commission great latitude in its control over the common carriers of the country. The Sherman Antitrust Act has given the courts a great deal of power over the general business of the country. This bill now extends that power radically and in many respects, it seems to me, far beyond what the country really needs.

In a speech delivered on the Mann railroad bill in the Sixty-first Congress I called attention to the general disposition throughout the country toward cooperation in business. This has been demonstrated in the organization of labor unions. These organizations have, in my judgment, done more to uphold the wages of the workingman of the country than any other thing, and while labor organization affects the wages in the respective trades in different parts of the country, nevertheless it is in labor, as in everything else, the survival of the fittest. While the labor organizations preserve a minimum wage. they can not compel the employer to keep the inefficient man.

I am an employer myself. I have found it profitable to employ none but union men. But, like every other employer, I seek to get the very best men I can. The well-paid and efficient man is much cheaper in the end than the poorer or the lower paid man. So the good mechanic has steady employment and in many cases higher wages than the ordinary or poorer mechanic. So it is in business. The man who succeeds is the man who works the hardest, who perseveres, who has more ingenuity, and who is a better manager of his affairs than the less successful man. The legislation under consideration seeks to hamper, it seems to me, the business man of smaller means and smaller opportunities. We may talk of equal opportunities and the fact that everybody should have the chance to earn a living. I agree with all of that. But, after all, the great majority of the people depend upon the skill, the ingenuity, and the courage of the business man, through whose ambition and energy business opportunities are created, and upon whom those who lack these qualities must depend for their livelihood.

Take the young man who has made a struggle from his youth to accumulate a small amount of money. He has saved from $500 to $1,000 and is ambitious to start business for himself. With laws on the statute books like the measure under consideration it requires courage, indeed, for him to risk the loss of his little capital in an effort to establish himself. He has not only the permanent and going business of his wealthy neighbor to compete with, but he has a law that forbids him to meet competition when it is necessary in order for him to get his share of the business of the community in which he proposes to establish himself.

Let us cite a case or two. A farmer in Pennsylvania living across the Delaware, whose market place is Trenton, or a farmer in northern New Jersey who lives across the Hudson from New York City comes to the market place with his auto truck or farm wagon loaded with produce. He arrives in the morning before the other farmers come in. He is the first on the ground. He disposes of his goods at a fair rate of profit. Later in the morning his competitors arrive. He has sold about half his stock and the other farmers are underselling him. He is compelled, if he wishes to dispose of the balance of his stock, to sell out for less money than he obtained from his earlier customers. It would seem if he did this that under section 2 of this bill he could be found guilty of discrimination in price between purchasers. Would he be able to say as an offset that he sold a different grade, quantity, or quality? It may be maintained by some that such sales were not made to defraud and do not come within the provisions of this bill. But will he not have to go to court if anyone attempts to prove he is guilty of fraud, and is he not, in fact, laying himself liable to blackmail?

Let us cite the case of the small manufacturer or merchant in the city of New York or any other city who is making the struggle for a beginning. He sells his goods to people in a neighboring State. He finds that his competitor is selling almost the same goods at a lower price. He has disposed of some of his merchandise at a living profit. He must keep the rest on his shelves or in his factory and go into bankruptcy unless he is willing to meet the market. If he meets that market price, he, too, may be considered guilty under the terms of section 2 of this act and liable to suffer a fine of $5,000 and a year in prison. I could cite numerous other instances. Take the business man who at the end of the season finds that he has a surplus stock on hand. If, in an effort to dispose of the stock, he sells at a lower price than that at which he has been disposing of his goods, is he not, under the terms of this act, guilty of discrimination in price and punishable by a fine of $5,000 and imprisonment for one year?

I am opposed to this provision whether applying to the large or small business man. But if it is going to hurt anyone it will hurt the small business man. The big one will be able, by manipulation of his grades, qualities, and quantities, to overcome the law, but the farmer, merchant, or manufacturer doing a moderate business will have to have a lawyer at his elbow to advise with him in every transaction that he undertakes. He will violate the law nearly every day in his life, and by this very act you will make nearly every business man in the United States a criminal.

The whole question of competition is the survival of the fittest. I am going to get my share of the business even if I have to take my competitor's business to do so. Every one of us wishes our neighbor to do well, and it is to the interest of the community to have everyone happy and prosperous, but if it is necessary for me to secure my competitor's business in order to succeed I am going to take it if I can get it, and no power on earth and no laws on the statute books are going to stop me, though I may technically violate the law in doing so.

What is the attitude of the community toward this legislation? Recently I inquired of people in New York City relative to this subject, and if the committee will bear with me I will read some of the letters I have received from business men, merchants, and manufacturers of my city. Most of these men are Democrats; they are eminent citizens; they supported

President Wilson and the Democratic Party in the election of 1912. Some are Republicans. Without exception they are insistent that the Democratic Party, in its present effort to legislate, is trying to discourage the business of the country.

I represent in part the great city of New York, and I want to make as strong as I possibly can my indorsement of the statement made by my colleague [Mr. METZ] a few moments ago. He is the only Democrat of the 31 Democrats from that State in this House who has stood up in his place to denounce this legislation.

I have been home for a few days and have had occasion to meet many men—many of our business men, and men in the ordinary walks of life—and I have not met a single one who believes this legislation would be other than disastrous to the great and small business interests of New York State. Resolutions have been passed by our manufacturers' and business men's association, our merchants' association, our chamber of commerce, and I am going to read just a few extracts from some of them.

Mr. SLOAN. Will the gentleman yield for a question?

Mr. CALDER. I will.

Mr. SLOAN. The gentleman commented upon the speech of his colleague [Mr. METZ], a Democrat from New York.

Mr. CALDER. Yes.

Mr. SLOAN. Is there a disagreement between him and his Democratic colleagues in thought or in expression?

Mr. CALDER. I have not conferred with all of my Democratic colleagues from New York City, but as to those who have talked with me privately, in the main I find they agree with the attitude of my other colleague [Mr. METZ], but for some reason are afraid to express their views.

Mr. SLOAN. Then that agreement is in thought and the disagreement is in expression?

Mr. CALDER. Yes.

Now, Mr. Chairman, from the March number of the Manufacturers' and Business Men's Pamphlet I read the following:

THE MARCH SESSION, 1914, LITTLE MEN IN THE SADDLE.

Little men are in the saddle. That is the great trouble with this country to-day. It takes big men for big things, and there are not many big men in the world. Little men abound on all sides. They are all right when they stick to little things, but when they undertake to handle the big ones, they go to pieces.

It is incredible that the people of this country can not understand the situation. In every other country, great corporations have been organized and, by their tremendous capital, power, and influence are reaching out for the commerce of the world.

If the business men of this country were left alone, they would enter into competition with all the world for supremacy in trade and commerce.

Heretofore our industries have been supplying the home market. Now, they are reaching out to the markets of the world. Do the people understand what this means in expanding industries, developing mineral resources and opening the way for the maintenance of the American scale of wages at the highest figure in the world?

Some day the people will understand this situation and will turn and rend the demagogues who are doing all the mischief. Some day the plain, common people will realize that a demagogue never filled a pay envelope "and never will!"—Leslie's Weekly.

"As the soil is improved by sowing it with different seeds, so is the mind."

ACTION OF THE NEW YORK CHAMBER OF COMMERCE.

I am going to read some extracts from resolutions adopted by the Chamber of Commerce of the State of New York on March 3, 1914.

In President Wilson's message on the new freedom he stated that—

Constructive legislation when successful is always the embodiment of convincing experience and of the mature public opinion which finally springs out of that experience.

And further says:

What we are purposing to do, therefore, is, happily, not to hamper or interfere with business as enlightened business men prefer to do it or in any sense to put it under the ban. * * * And, fortunately no measures of sweeping or novel change are necessary; * * * what we have to do can be done in a new spirit, in thoughtful moderation and without revolution of any untoward kind.

Until recently the declarations of party leaders, Government officials, and publicists as to industrial conditions needing correction in the interest of the public welfare have been confined to business organizations seeming to have at least the potentiality of operating in restraint of trade, enjoying undue privilege or imposing unfair conditions.

Now, for the first time, the idea is suggested that all business, of whatsoever nature, conducted under corporate form shall be brought under the most exhaustive and complete scrutiny of its most intimate and personal affairs by a commission which has practically no other powers than those of investigation.

It is indeed a serious matter when the framers of legislation, being the elected representatives of the people in Congress, should seem to indicate that in their minds all those conducting industrial enterprise are less honest, less fair, and less public spirited than those who are drawn into public life to frame and administer the laws.

If business men of the country do not generally resent and protest against such implications, they will be considered to have tacitly admitted them.

There are three fundamental types of law affecting industrial life—legislative law, moral law, and economic law.

None of these types of law is immutable. On the contrary, all are changing.

Legislative law is enacted, amended, repealed, and reenacted.

Moral law, at least in its aspect as the expression of the conscience of the people, changes with the advancement of civilization and the influence of ethical and religious culture.

Economic law, the product of economic forces, springing from we know not where, is the most inevitable, as it is the most irresistible, of all law.

Let us not forget that statutory law, if incompatible with or too inflexible to be coordinated with the changing elements of economic force, or if administered contrary to or in ignorance thereof, will either be overborne by economic law and necessity or else will tend to restrain, if not to destroy, industrial progress.

A survey of the history of the remarkable industrial and business development of this country indicates that its achievements have been in the main due to the initiative, energy, enterprise, and bold courage of an immense number of individuals breathing and operating in the free air of untrammeled opportunity, in which alone true genius can work and survive.

The spirit of unrest has been said to largely spring not alone from unequaled conditions of life but from what has been called the unequal distribution of wealth.

Undoubtedly what has been meant is the unequal acquisition of wealth, but there will always be unequal acquisition of wealth as long as there is unequal distribution of brains, industry, and thrift, and those are qualities of mind and character which no statutory laws can regulate or control, but the beneficent exercise of which unwise law can greatly restrict and discourage.

Men having those qualities have ever been able to see and grasp opportunities, and men using them conscientiously have ever secured recognition among their fellows.

To shackle the genius of this country, to limit individual freedom and initiative within the confines of parental government direction other than the well-defined limits now understood and recognized as inconsistent with moral law, modern ethics, and the public welfare, would be to set brakes upon the splendid spirit of our people by which all our achievements have been inspired, if not, indeed, to break down the march of progress, and to force us to the rear in that international contest for the world's business, by which alone this country can continue to grow and reach the fruition of which there has heretofore been such ample promise.

Industry has not as yet fully adjusted itself to our changed tariff policy, and we are about to make great changes in our financial methods. Important fluctuations in our international balance of trade might add serious burdens to the new banking and currency system.

Your committee has been unable to ascertain from what business organizations or industrial sources there has emanated any important demand for legislation as outlined, and has not yet been able to find any expression of responsible or organized business opinion that legislation of such character would be timely, appropriate, or beneficial to the business interests or the people of this country.

With this consciousness abroad in the land, your committee believes that what business men generally desire, what industry most needs, is the certainty of a period of rest for the peaceful readjustment of all enterprise that is inconsistent with the accepted principles of law and ethics, and for the energetic advancement of all individual endeavor free of any sense of repression, secure in a sense of liberty of action, and guarded from the danger that the disclosure of personal prerogatives and private achievements would entail.

I have here a letter from the president of a bank in New York City. And I might add, Mr. Chairman, that when this bill was reported I sent a copy of it to every bank president in the city of New York and to every important business man that I knew in order to obtain an expression of opinion from them. Here is a letter from a gentleman who voted for Woodrow Wilson for President in 1912 and supported the Democratic ticket. Listen to what he says:

HARRIMAN NATIONAL BANK,
FIFTH AVENUE AND FORTY-FOURTH STREET,
New York, May 18, 1914.

Hon. WILLIAM M. CALDER, M. C.,
House of Representatives, Washington, D. C.

MY DEAR SIR: I have your letter of May 15, inclosing copy of the so-called Clayton antitrust bill, and as you ask for my views on the subject, I give them condensed and to the point.

The Democratic Party, in my opinion, has done very well; but it is suicidal to consider further legislation at this time. The country is now prepared, through the promise of big crops and increased freight rates, to go ahead with good business; but if this continual legislative nagging is to be in order you can take my prediction that you will see the greatest upheaval at the election next November that has been seen in a great many years.

There is no more necessity for all this antitrust legislation than there is for a reregulation of the moon and stars. The country is getting heartly sick of politics. It is a thorn in the flesh and has caused capital to withdraw from many channels, necessitating the laying off of labor, and timidity by all capitalists toward embarking in new business and directions.

If you could but realize how I, as president of a bank in the retail-business center of the largest city in the country, have been called upon by our customers and depositors to explain the reason for the falling off in trade, you would appreciate the feeling I have in writing you as I do. My answers have invariably been that it is politics alone that is causing the disturbance, and it is to our representatives they must turn for the results.

Very truly, yours,
J. W. HARRIMAN,
President.

Mr. FLOYD of Arkansas. Is any name signed to that letter?

Mr. CALDER. Yes; Joseph W. Harriman, president of the Harriman National Bank, Fifth Avenue and Forty-fourth Street, New York City.

Permit me to call the attention of the committee to a number of newspaper editorials from some of the papers of the city of New York. I have several from the New York Times, one of the leading dailies in New York City. It was an earnest supporter of President Wilson and the Democratic Party in 1912.

The editorial of February 13 of this year in relation to antitrust bills says:

THE ANTITRUST BILLS.

NEW YORK, *Friday, February 13, 1914.*

Undoubtedly, it is well to exhibit more joy over the one sinner who repents than over the ninety and nine who never went wrong. But is it worth while in attempting to bring the hundredth man to repentance to raise such a turmoil, uproar, and disturbance that the other 99 can neither sleep nights nor work daytimes? That is the question presented by the five antitrust bills, called, seemingly without warrant, the administration bills. President Wilson, in his talk with the members of the Senate Committee on Interstate and Foreign Commerce on Wednesday, said that 90 per cent of the business of the country needed no governmental attention; legislation was needed only to prevent particular abuses by a minority of the business community. The question that confronts Congress and the administration, and in a very serious way confronts the country, is whether this legislation shall be wise and sound, adequate only for the proper protection of the public, or whether it shall be radical and destructive, looking beyond the welfare of the people to the political profit of demagogues and agitators.

The 90 per cent of the business interests of the country who, according to the President's statement, are in no need of correction are not opposed to any sane and necessary enactments for the restraint of the other 10 per cent, supposedly made up of transgressors. Sane and necessary legislation is not disturbing. But the holding up of all the business of the country, now after long trials hopefully awaiting the return of prosperous conditions, while ignorant and incompetent legislators fumble with projects of law that are the fruits of their own ignorance and incompetence would be a needless calamity and one which the country should not be called upon to bear. Men of experience in business, men who are not malefactors, have given Congress the benefit of their advice; others stand ready to give it. There was much wise counsel given in the addresses made at the chamber of commerce convention yesterday. If Congress goes wrong with these projects, if it adheres to the misshapen measures it has produced in committee, it can not plead lack of light in excuse. The true cause will be its own blindness. And in that case the greatest sinners of all will not be the President's 10 per cent of business men, but the Congressmen and Senators. The people will have been betrayed in the two Houses of their own Congress. But the President's perceptions are clear, his words indicate that, and his influence over Congress is great.

In the New York Sun, in its issue of April 13, in the financial review, attention is called to the great crops in the West and the excellent condition of business abroad, and that the only hope for the future is the indication of the election of a Republican Congress next fall, clearly outlined in the recent congressional election held in the seventh New Jersey district.

In an article in the Brooklyn Eagle, under date of May 14, this paper, which rendered valuable service in behalf of Mr. Wilson in the campaign of 1912, has an article entitled "Drive in the knife to the hilt."

So as to provide against any scarcity of issues when the next House of Representatives is chosen, the leaders, under the caucus-bound program, will insist that the Covington antitrust bill, the Clayton antitrust bill, and the Rayburn bill for Federal regulation of railroad stocks and bonds be passed in the order named, or at least voted upon and sent over to the Senate.

The right not to alter but to add to this list is, of course, held in reserve lest it be not long enough. If neither the width of a church nor the depth of a well will suffice, let there be more to come, much as we have had already. Take every possible advantage of the strength of the patient. Meanwhile it is not improper to remark that the new schedules are operating satisfactorily—for other countries. Symptoms of recovery from that "shock" are scarce.

Talk of conspiracy has come to an end. No longer is it alleged that factory doors are closing wholly and solely for the purpose of discrediting revision downward. Goods of foreign manufacture are coming here in larger quantities. Goods of domestic manufacture are going out in smaller quantities. In six months we have imported $13,000,000 more and exported $37,000,000 less than for the corresponding period of last year. Hence the shock, aggravated by the substitution of a deficit for a Treasury surplus.

There is optimism as to the effects of the second capital operation—the reformation of the currency. But there was also optimism as to revision downward. That was to be followed, as it were, on the spot, by a decrease in the cost of living. There is no sign of it. Prices are not lower than they were six months ago, but the wherewithal to pay them has contracted. How currency reform will affect conditions is not known. It awaits the test of actual operation.

There is a demand for more, and it is real. There is a demand for antitrust legislation, and its voice is stentorian. It comes from the Congressman who is anxious to make a record to which he can "point with pride." He will not point to the imports or to the exports, nor will he call attention to the Treasury deficit or to the increased and increasing number of the unemployed. Principally, he will confine himself to the rapacity of the rich and the oppression of the poor.

And why shouldn't he? Bait of that sort has been swallowed before, plus hook, line, and sinker.

This editorial is indicative of the attitude of the people of New York City on the legislation under consideration, and in my judgment ought to have the effect of causing at least the Representatives from the great city of New York to stop and take account of stock before passing a measure which the people from that community feel confident would do them great injury.

The attention of the business men of the country has been called to section 9 of this bill, prohibiting a man being a director in more than one bank or trust company, eliminating, however, towns and cities under 100,000 and banks whose capital and surplus and undivided profits aggregate more than $2,500,000. It seems to me this is the grossest kind of discrimination. The Judiciary Committee has sought in this provision not to offend the bankers in the smaller towns and cities of the Nation, and they seem to create the impression that it is possible for the bankers in the larger communities to be corrupt and dishonest with their depositors and stockholders and the people in the communitiy generally as against the officials of the banks in the smaller cities and where the resources of the banks are less than $2,500,000. I maintain, Mr. Chairman, that in the smaller towns the officials of the banks are of no higher standing than those in the larger banks in the great cities. I make the statement here, Mr. Chairman, that the bankers of the city of New York, with very few exceptions, are the very best men in our city and have the very best knowledge of the banking business, and the best informed and most valuable are directors of more than one bank.

I have a letter here from the president of the National City Bank of Brooklyn, advising me that if the provision relating to interlocking directorates becomes a law he will lose the services of the three most valuable men on his board. I have also a letter from the president of the First National Bank of Brooklyn citing the same objection. I have also a letter from the president of the Montauk Bank, of Brooklyn, Mr. Henry H. Randall, which is exceedingly interesting. Mr. Randall is a director in several banks on Long Island. He is one of the most conservative bankers in all the city. The president of the Importers & Traders' National Bank, of New York, also makes the same complaint. This is one of the great commercial institutions of the city; and this bank will lose as the result of this legislation five of her best directors, men upon whom it has depended in its great business transactions during the many years of its existence.

Mr. Chairman, I can not agree that the establishment of a police power over the legitimate business of the country will be of lasting value to the people. Would it not be better to have this measure thoroughly digested by the country and then come back next winter and discuss the matter with much more intelligence than we are able to do at this time? I have quoted from several of the great business concerns of the metropolis and I have read you letters from some of our leading bankers. These gentlemen are more interested in the business development of the country than anyone else. I do not believe there is a Member of this House who has had personal contact with large business matters that has the slightest idea that this legislation is going to help in any degree to better conditions. A Democratic Member of Congress from the State of New Jersey only yesterday informed me that the antitrust bills passed in that State just before President Wilson retired from the office of governor—the measures famed throughout the country as the "seven sisters bills"—have never been enforced in the slightest degree, and if enforced would drive out of the State a large portion of the business transacted there. We have been conducting a waiting policy in the matter of our dealing with the Republic of Mexico. Would it not be better, in a matter of such far-reaching importance, to hesitate before placing on the books a measure to which there has been so much objection?

Administration Critics—Wise and Otherwise.

EXTENSION OF REMARKS

OF

HON. JOHN R. CONNELLY,

OF KANSAS,

IN THE HOUSE OF REPRESENTATIVES,

Monday, March 1, 1915.

Mr. CONNELLY of Kansas. Mr. Speaker, from the first day that Mr. Wilson took his seat in the White House to this hour he has been bitterly assailed as to every move that he has made by the bitter partisans of the House and the country. Every now and then men who are blinded by a bitter partisan spirit proceed to come forward and spill their spleen on the President and his efforts to serve the great common masses of the people. There must always be conceded in a Government like ours the right to men who hold views at variance with the party in power to express a criticism of a policy and a party, and useful criticism is always to be courted rather than to be discouraged. But the bitterness of the criticism of President Wilson as to not only one of his policies but in each and every move that he makes and every stand that he takes shows how anxious some partisans and partisan newspapers are to serve the great interests that have for a half century fattened from the necessity of the great common people and which are willing to share the spoils with certain of these special newspapers. It is pleasant

to note that some of the real big men of the Nation, men who do not agree with many of the policies of the Democratic Party, have recently risen above the pettiness of partisanism and have not only merely refrained from this class of criticism, but have not felt that they were sacrificing their standing before the American people when they give liberal praise to some of the policies of the President. Not the least good that can come from the example of such men is the showing of the pettiness of the carping critic who fears that to give approval of one thing done by one who is affiliated with another party could safely be accorded for fear that in some way it might jeopardize his own little personal success. The little, narrow partisan in this great country of ours certainly can reflect no credit upon the intelligence of the people who sends him here. A prominent editor out my way some years ago made a very apt remark when he said that politicians were like automobiles in that the cheaper they are the more noise they make.

I like the fellow who really believes things. I would not give much for the fellow who does not have political convictions and political opinions. Some of the best men that I know are men who do not view many questions the same way that I do, and therefore they do not always come to the same conclusions as I do. This does not necessarily mean that they are always wrong and I am always right, nor does it prove conclusively that they are always right and I am always wrong. The fact, however, that they can appreciate that I may in some instances be right shows that they have been touched with the greater spirit of Americanism, a spirit that even these carping partisans will at no great time in the future adopt, for they will soon have discovered that the intelligence of their constituency has advanced to that place where it will rebel against the pettiness of puerile and unjust criticism.

Possibly the greatest criticism that has been leveled at this administration is the criticism of the tariff bill that it has passed. It is perfectly legitimate to bring any indictment that is true against this or any other bill, provided the indictment is made to point out a weakness of the bill, for, like all legislation, it is only the work of human minds and human hands; and that here and there may be found some schedules that will not bring exactly the results that the men may honestly expect them to bring is no special evidence of criminal incompetence on the part of those who framed the bill. I do not altogether agree with the expressed opinions of some of my Democratic colleagues who say that to change a certain schedule, even though for reasons unforeseen it has not produced the results that it was expected to produce, is in some way a confession of weakness. I believe the people of this country are coming to realize more each year that there is entirely too much party bigotry in all parties, and that they will approve of that spirit that will dare to break a precedent even in an effort to know and do the right.

Those who want to be fair—and they constitute a great per cent of those who do not profit by unfairness—will concede that some of the predictions made on both sides of this Chamber by members of both parties have not come true and will not come true. Some of the Republican Members have been kind enough to point out some of the mistaken prophecies made by the Democrats at the time of the making of the tariff bill, and I may therefore be pardoned if I presume to remind of some prophecies that were made by Republicans at that time that have not come true.

I recall that some of the Members from agricultural sections of the country, elected here as Republicans, went out of their way to predict great calamities that would come to the farmer under this tariff law. They said that wheat and cattle and corn and eggs and meats of all kinds would be greatly reduced in price because of it. They especially bemoaned the fellow who was engaged in the production of wool and sugar; he, according to the dire and awful prophecies of these gentlemen, was especially to be made an object of their solicitude. Of course they were mistaken. The farmer was never more prosperous in the history of the country than he is to-day. He is prosperous, but not more so than he deserves to be. He has in the long years of the past seldom reaped a just reward for the work that he has done and the sacrifices that he has made, but he has kept on his steady struggle for better things and better conditions, and now he is rewarded in some ways by being the beneficiary of some of the conditions that exist. I am not so narrow as to be ready to harshly criticize the fellow who represents an urban population for introducing resolutions here looking to the paying of an embargo on the foodstuffs that the farmer has to sell, provided that he is content to stop when he has made all the political capital that it will bring him; but when he attempts to press that resolution he will be met not only by the man who represents an agricultural people, but many of those who do not represent such a people will see the injustice and refuse to be a party to such a move. If the farmer has tread the wine press of adversity during the long years when his labor yielded no adequate return, he must not be legislated out of the first fair wind that has blown his way for many a day. But, lest I stray from the question I started to discuss, I will return to the unjust and unfair critic who has the last few weeks been working his jaw overtime and giving his brains a vacation. The protective tariff, after being tried for 30 years as a reviver of agricultural interests, was only a moderate success, if we are to view it in the light of history as we find it stored away in the musty volumes of the CONGRESSIONAL RECORD. In looking over the history of this House and the legislative body at the other end of the Capitol Building I find that on the 17th of March, 1890, the Hon. Daniel W. Voorhees, a distinguished and able Senator from the State of Indiana, introduced a resolution in that honorable body that would give some idea of the conditions of agricultural interests of the country at that time, which was 30 years after the Republican Party had started to make these people prosperous through the agency of a protective tariff, and no other party had during that long tenure of office been able to muster a force sufficient to displace a Republican tariff law from the statute books of the country. The following is the resolution above spoken of:

Whereas the deep and widespread depression and decay of the agricultural interests of the American people, the enormous and appalling amount of mortgage indebtedness on agricultural lands, the total failure of home markets to furnish remunerative prices for farm products, the palpable scarcity and insufficiency of money in circulation in the hands of the people with which to transact the business of the country and effect exchanges of property and labor at fair rates, are circumstances of the most overwhelming importance to the safety and the well-being of the Government: Therefore be it

Resolved, That it is the highest duty of Congress in the present crisis to lay aside all discussion and consideration of mere party issues and to give prompt and immediate attention to the preparation and adoption of such measures as are required for the relief of the farmers and other taxed and underpaid laborers of the United States.

I wish that every farmer as he comes in from his day's labor now and counts up that every bushel of wheat that he has in the granary is worth a dollar and fifty cents, every cow in the corral is worth from $50 to $80, every hog in the pen is worth from 7 to 9 cents per pound, every horse in the barn is worth fine and fancy prices, and every pound of butter that his wife makes and every egg that she gathers from her poultry yard are all eagerly sought for at remunerative prices—I wish that he, before he believes all that these severe critics have to say about the Underwood tariff law, would stop and read the above resolution that was introduced and discussed by as able a man as ever graced the Halls of that historic body at the other end of the Capitol, 30 years after the Republican Party started in to make the farmer prosperous by a protective tariff, and the Republican Party had written every line of tariff legislation that had been placed upon the statutes of the country for that long period of time. It is worthy of notice how the critics of the present tariff law have shifted their batteries from one position to another. They started out to show that the bill would drive producers here to the wall; in this they soon discovered that they were weak; then they worried for a while about the balance of trade being against us; recently the balance of trade has veered so much in our favor that they have now shifted and say that the bill does not produce revenue. It must be conceded that so long as the conditions are such as to prevent a free flow of commerce from nation to nation that any claim, either for or against the merits of a revenue bill, looking to its revenue-producing accomplishments, must be but little more than a guess, and all fair people will concede that no tariff bill framed to meet a normal trade condition could be either safely praised or fairly condemned at such a period of abnormal conditions. It is only fair, as it appears to us, to say that the new tariff bill up until the time of the breaking out of hostilities in Europe was even a greater revenue producer than its framers claimed it to be.

I know that the great body of the people of the country are not in sympathy with the severe criticism that has been accorded President Wilson from certain quarters regarding his Mexican policies. The people are intelligent, and they are in the main fair. They realize that to blaze out the way is one thing and to stand back and find fault after the lines have been run is quite another thing. The troublous times in the war-cursed country of Mexico is a matter that is deplored by every right-thinking man, regardless of what may be his political alignment. We, who are blessed with only a limited insight into conditions there, can now see where some little details could possibly have been improved upon, but we have the very great advantage of being able to look back on what has been done, rather than having to take the place of those in command

and look forward to what was to do. The one thing that saves us from losing faith in the future greatness of our country, when we hear the carping of petty and pittiless critics at this time, is the assurance that the great body of men and women, those who form the real bulwark of the country's greatness, those who work in the field and factory, those who work in the mills and mines, are not sharing in the bitterness of this petty criticism, but are, on the other hand, treading the higher grounds, where true patriotism has a higher ambition than to circumscribe itself with the desire for political advantage and a hope for partisan gain.

Mr. Speaker, I want now to refer to another criticism that has in the main been advanced with a different spirit and with a different purpose. I mean the criticism that has been made regarding the failure of the President and this Congress to place embargoes on munitions of war that are being sold to the belligerent nations, some of whom are so situated as to take advantage of the shipment of these arms and ammunition and some that are not. I know full well the hold that ancestry has upon all of us, and I approach the comment on this criticism with a good deal of charity for the position taken by those who have urged that this embargo be placed. In many instances it has been represented in the press of the country that these sales of arms and ammunition only profit the manufacturers of these commodities, while they violate the spirit of neutrality. Much has been said in an offhand way about such matters that have had a tendency to prejudice a great many well-meaning people as regards to this matter without giving much enlightenment.

Of course it is one thing to be free from responsibility and offer criticism, and quite another to have the responsibility resting upon you of upholding the Constitution and along with it those treaties and traditional customs that have become a part of the fundamental law of the land through a long term of usage. There are two very distinct sides to the laying of embargoes upon arms and ammunition that I hope I will be able to point out without being accused of entering into any long and labored discussion of the relative merits. On the one hand it is urged that the laying of these embargoes would have a tendency to terminate the deplorable conflict in Europe, and with that perspective I have no criticism against those who have urged it. I feel that even exceptional measures would be justified if for a certainty this object might be accomplished. On the other hand it has been almost the unbroken usage of centuries to allow the sale of these munitions by neutral nations to belligerents, and it is urged by those who justify the usage that another course would compel every country during the long intervals of peace to manufacture and keep on hand great stores of military supplies, which become obsolete with the passing of years; and thus every nation, in order to be ready for some emergency that might never come, yet because of the unreliability of human knowledge of what is to come in the future lives of nations, would be impelled to lay such a Federal tax burden upon the people in time of peace as to become almost unbearable. In order to escape this great military burden in times of peace it has been almost the uninterrupted usage of the past that neutral nations shall sell to any nations that may come and ask for them any munitions of war that they may have to sell. This being by long usage generally recognized as a part of the law of nations, it is not difficult to see why the President should hesitate to act in violation of this rule at a time when such a violation might involve us in serious complications with these other nations.

At this time, when the countries in actual conflict comprise not only a majority of the population of the earth but more than half of the land area of the earth, I plead with my countrymen that it is not a time to ask the President and Congress to establish new rules and violate customs of long usage in dealing as a neutral nation with the nations of the earth that are engaged in this unhappy conflict. Whatever may be our difference of opinion as to the value of the policies of different parties as now constituted and organized, whatever may be our choice as regards the best industrial policies that should be pursued in our own country, let us be charitable enough to concede that when danger knocks at the gate of our beloved country and threatens us with international complications we shall be a united people, ready, if need be, at all times to defend our flag with the last drop of patriotic blood that the Nation holds; but fully determined that if such a calamity shall come, it will come in spite of our best efforts to avoid it, rather than because we have abrogated rules of long international usage in order to provoke and invite it.

When we get far enough away from the present war that is devastating Europe we will, in my humble opinion, be more able to appreciate its magnitude than we are to-day. All the wars of Cæsar, Alexander, Napoleon, and Frederick the Great will then appeal to us as only skirmish lines in the great tragedy of world's wars. Its cost in men and money will stagger humanity and give future generations a new sum to compute in the crime of conflicts. It has driven more than 2,000 German ships of commerce alone from the sea, and a thousand more of English trade vessels have been diverted from the peaceful pursuits of carrying commerce to supply colliers and carriers for the needs of her navy. It has made every shipowner in every neutral nation hesitate to set sail with his ships of commerce over a sea that is bedecked with frowning battleships, cruel submarines, and hidden mines. Is it any wonder that in the first five months of this great war the international trade of the world diminished over $15,000,000,000, and has not only effected the commercial, industrial, and financial conditions of our own fair land, but other neutral nations no less than our own?

Finally, Mr. Speaker, may I indulge the hope that in the discussion of these criticisms and conditions I have not failed to exercise that charity for the opinions of others that should always characterize our discussion in a free country like ours. My purpose during the time that I may be honored with a seat in this honorable body, whether that time be brief or otherwise, I hope will always be to view every question with as wide a vision as I may be capable of and with as bounding a charity for the honest opinions of others as may be seemly and proper.

If these few remarks shall in any way help to clear the vision of those who honestly seek to know the right, if they shall increase the caution with which we as a people approach conclusions, if they shall add to the charity of those who have a common cause in the welfare of the great common people of the country, if they shall help to distinguish the bitter rantings of partisans from the pleadings of patriots, I shall be content.

Rural Credits.

EXTENSION OF REMARKS
OF
HON. HORACE W. VAUGHAN,
OF TEXAS,

IN THE HOUSE OF REPRESENTATIVES,

Saturday, February 27, 1915.

Mr. VAUGHAN. Mr. Speaker, under the privilege granted me to extend my remarks on the subject of rural credits, I wish to say that I regret exceedingly that while everybody is declaring in favor of legislation providing a rural-credit system, we have been unable to agree upon the kind of legislation or the kind of rural-credit system we should have. I do not berate this Congress for this failure, for I realize that this subject is comparatively new and the people have not yet had sufficient information upon it for public opinion to form in favor of any particular legislation upon it. I do not find any mention of the subject in the last Republican platform, and while the Democratic platform says it is "of equal importance with the question of currency reform," it merely recommends "that an investigation of agricultural credit societies in foreign countries be made, so that it may be ascertained whether a system of rural credits may be devised suitable to conditions in the United States." Such investigation has been made and much information on the subject has been obtained, but it has not yet become sufficiently generally known for public opinion to form in favor of any specific legislation. Though this is true, I can not but regret that this Congress has not availed itself of the opportunity to take the lead in the matter, to work out a proper system without waiting to be driven by public opinion after it is formed in favor of some specific legislation. This Congress has created two rural credit investigating bodies; they have reported bills differing widely, but agreeing in that each of them establishes a land-mortgage credit system; but neither of them makes, nor has any bill that has been introduced made, any provision for a cooperative agricultural credit system to enable the farmers to organize cooperative societies in their respective communities whereby, through the combined strength and credit of all, each member may be able to obtain such credit for productive purposes as he is entitled to at a fair rate of interest; none of the bills makes any provision for personal credit. They provide means whereby money may be obtained when needed by the man who has land he can mortgage. That man can now obtain money at the banks and from other sources. Of course, he now has to pay too high interest, and a proper system of making loans secured by land mortgages at a low rate of interest would doubtless help many owning a little land to get money

at fair interest, and enable many to acquire homes who otherwise are at the mercy of the money lenders, and I am for any safe proposition which will give our people money at 5 per cent, yet no land-mortgage system, however perfect it may be, will supply the needs of American farmers.

Farming must be made profitable to the man who actually tills the soil; it must be made more profitable for the tenant ever to be able to become a home owner. To bring about this condition it is necessary to provide ample credit facilities for the actual tillers of the soil. The farmer, the land-owning farmer as well as the tenant farmer, should have a credit system adapted to his business. The farmer needs an entirely different credit system from that which is required by commercial and industrial interests.

Providing the means whereby the land-owning farmers may borrow from the Government money not exceeding half the value of their mortgageable land by mortgaging it as security, though it will accomplish a great deal of good and enable many to save their homes from foreclosure, many to acquire homes, and many to escape the clutches of the money sharks, does not provide a credit system for the business of farming.

I favor making provision for lending on land security. I shall not vote against it because it does not provide a rural-credit system, but I am also in favor of a credit system that will answer the needs of the man who has no land to mortgage, as well as the man who has; a system under which the farmer may cooperate with his neighbors, form credit societies, and on the strength of the industry, character, and credit of all each may be able to finance himself.

I wish to call attention here to a letter from Mr. R. C. Milliken, a native Texan, who has devoted a great deal of time and study to the question and taken a great interest in advancing rural-credit legislation along the right line. He contends, and I agree with him, that the most effective way to accomplish this is for Congress to give the farmers themselves, through their own selected expert representatives, a hearing at which they may present bills and have the opportunity to show their merits before some committee or commission acting under authority of Congress during vacation. I hope one or the other of the resolutions providing for taking this action will be given consideration and agreed to.

Mr. Milliken's letter follows:

WASHINGTON, D. C., *February 25, 1915.*

Hon. HORACE W. VAUGHAN,
Washington, D. C.

MY DEAR SIR: I beg leave to direct attention to the pressing need for immediate passage of the Sheppard and Candler-Doolittle-Helgesen resolutions for the creation of a commission to hold hearings during vacation on such personal rural-credit bills as may be presented by experts having sufficient authoritative backing from farmers or leaders of farmers' organizations.

Personal or short-time rural-credit societies are not untried experiments, for nearly every country in Europe has them, and they have proven most beneficial to the agricultural classes of those countries. The need of such societies is well stated in the report I hand herewith from J. R. Cahill on Agricultural Credit and Cooperation in Germany, Senate Document No. 17, page 17.

You are aware of the fact that I drafted a bill on this subject more than a year ago, which the chairman of the Senate Banking and Currency Committee had printed for the use of his committee. The publishers and editors of the largest farm papers petitioned the chairmen of the Banking and Currency Committees for special hearings on my bill, and asked that I be employed to represent the farming interests at such hearings. The signers of that petition represent papers with an aggregate circulation in excess of 3,500,000 and a capital of several million dollars. I hand herewith a copy of that petition.

The Farmers' Union of Virginia circulated petitions asking Congress to grant the requests of that farm press petition, several thousand Virginia farmers signing them. I hand you a copy of that also.

All those petitions invoke the same principle invoked in the four resolutions I call your attention to, namely, a judicial investigation of bills on this subject by experts selected by the interested parties. The present banking institutions of this country do not meet the requirements of our farmers, but there is so much ignorance on the subject that the farmers had best meet the bankers in open court than in the secret lobby. The farmer has everything to gain and nothing to lose by an open investigation of this question, and that is the only way he can ever obtain his rights in this matter.

Let me call your attention to the fact that the method of investigation proposed by those resolutions has received the indorsement of the legislative committee of the National Grange, with accredited representatives of the largest body of organized farmers in the country, and many prominent members of the farmers' union have indorsed this method.

There is such a rush of business in the House at this time that I fear nothing can be accomplished at this session. There is but one way by which our farmers can secure this legislation, and that is for the weekly press to take it up and everlastingly keep it up until Congress meets next December. The first step is to secure a proper investigation of it. Therefore if the weekly press were to begin, week in and week out from now till then, and insist on the adoption of the Sheppard and Doolittle-Candler-Helgesen resolutions, Congress would be forced to grant their requests. We would have land-mortgage legislation now if we had had the right kind of investigations. Congress created two rural-credit investigating bodies two years ago. Each has a land-mortgage bill, and because they are at loggerheads the farmers can get nothing. Three years ago I made an argument before the first rural-credit investigating committee, and I predicted then that the farmers would never secure anything unless Congress appointed a committee of experts. I hand you herewith that report.

Let me repeat, the weekly press can secure this investigation for the American farmer; and what a victory it would be for them. Let them begin at once treating those resolutions editorially. Let them ask their Members of Congress what objections they have to them. Let them ask their readers to demand the adoption of those resolutions. Those resolutions are the same, and they only ask for an appropriation of $9,000. Why, I have personally spent more than that to advance this cause, not to mention the time I have devoted to it.

I have not the slightest question of the patriotism of the weekly press to take this in hand if it is properly brought to their attention, and I am gratified to know of your willingness to cooperate in the matter, because you know that this question of personal rural credit is the most important one for the people of this country to-day.

Again thanking you for your efforts in this matter, and with every assurance of my high regard for your abilities and patriotism, believe me,

Sincerely yours, R. C. MILLIKEN.

VIRGINIA FARMERS' PETITION.

To the Congress of the United States:

We, the undersigned farmer citizens of the United States, pray that the requests contained in the farm press petition asking for a special committee to investigate the personal rural-credit bill drafted by Mr. R. C. Milliken be appointed and employment of its author to appear and prove up its merits. The system of personal rural credit is not an untried experiment, for nearly every country in Europe has enjoyed the benefits of the same for years. So the only thing for us to do is to adapt the principles underlying the success of those systems to meet the conditions in this country.

There have been four rural-credit investigating bodies established by Congress during the past two years, and as not one of them has reported a bill for personal farm credit, are we not justified in concluding that the fault may lie in the investigating machinery? We believe the function of a congressional committee to investigate a purely scientific question like credit is judicial rather than legislative, and, being judicial, its machinery should comport with that of other judicial bodies, which provide that the interested parties may appear by expert representatives and establish the justice of their contentions.

Therefore we earnestly pray that Congress at the present session grant the requests of that farm-press petition, so that the investigation may be held during vacation and a report made at the next session, and thus enable the country to have this legislation from the Sixty-third Congress.

Name and post-office address of petitioners.

Name.	Town.	State.	Rural route.
.....	.....	.....	.....
.....	.....	.....	.....
.....	.....	.....	.....

NOTE.—Several thousand Virginia farmers signed these petitions, which were presented to Congress.

FARM PRESS PETITION.

(This petition was signed in duplicate and addressed to the chairmen, respectively, of the Senate and House Banking and Currency Committees.)

DEAR SIR: We, the undersigned representatives of the rural press, would respectfully call your attention to the necessity for rural personal credit legislation. We are earnestly of the opinion that farm mortgages alone will not meet the needs of rural finance, no matter how good the land-mortgage system may be. Of the two, personal credit is needed the more.

No personal credit bill is even pending so far as we know, to say nothing of being pressed for passage. None of the commissions or committees has drafted a bill on this subject, and the only one to which our attention has been directed is the one drafted by Mr. R. C. Milliken, which has been printed for the use of the Senate Banking and Currency Committee.

We feel that the country needs more light on this subject, and we believe that if a committee of your body, or perhaps a joint committee of both bodies, were appointed to conduct hearings on the bill drawn by Mr. Milliken and a monetary expert who is thoroughly familiar with its provisions and the objects to be obtained through it were employed to aid the committee in proving it up it would be conducive of good results, especially so if all the interests affected by it were also permitted to appear before the committee by experts who oppose it. This would be in the nature of a trial by court, where the parties at interest are presented by counsel of their own selection; and experience has never shown a better method of establishing the truth.

We would respectfully ask, therefore, that you use your good offices for the appointment of such committee and employment of Mr. Milliken to aid it in establishing the merits of that bill. We might suggest that it might be well for the chairman of the committee to notify the presidents of the American Bankers' Association, the State Banking Commissioners' Association, the State Insurance Commissioners' Association, and the Association of Life Insurance Presidents of their privilege to appear before the committee, either in person or by such monetary expert, actuary, or other representative as they may select, who would be accorded the same rights and privileges as accorded by the committee to the monetary expert for the proponent.

Respectfully, yours,

HERBERT QUICK,
Editor Farm and Fireside, Springfield, Ohio.
WILMER ATKINSON,
Proprietor Farm Journal, Philadelphia, Pa.
ARTHUR CAPPER,
Proprietor Capper Publications, Topeka, Kans.
ALSON SECOR,
Editor Successful Farming, Des Moines, Iowa.
J. E. JONES,
President United States Press Service, Washington, D. C.

NOTE.—The signers of this petition represented farm papers with more than 3,500,000 circulation and several millions of capital.

EXCERPTS FROM THE ARGUMENT OF R. C. MILLIKEN AT THE HEARINGS BEFORE THE COMMITTEE ON AGRICULTURE, HOUSE OF REPRESENTATIVES, ON SENATE JOINT RESOLUTION 75, FOR THE CREATION OF A COMMISSION TO GO ABROAD AND STUDY RURAL CREDIT, DELIVERED MAY 29, 1912.

Mr. MILLIKEN. Our consuls can't make such an investigation as is necessary for the guidance of Congress, as they are not monetary experts. A lawyer must know something about his case before he begins to bring out his evidence before the jury. * * * An attorney can not properly present his case on its merits to the jury through his witnesses unless he has previously studied and assimilated the evidence himself. He can't pot luck and succeed. Therefore if you send over there men who are not monetary experts it will be a waste of money. It would be better to have a commission composed of philosophers of credit. They certainly should know enough about monetary science to be able to tell when they were investigating an unsound system and to discuss the subject intelligently with foreign monetary experts.

* * * * * * *

It is well recognized that we have the weakest banking system in the world; yet if foreign consuls in this country should write critical analyses of it for their own people and they should be published, as would be the case, don't anybody know they would have to leave this country? They would be charged with meddling with political conditions here.

Members of Congress have quite enough to do without spending years of their time studying monetary science, and I mean studying and not merely reading such literature on the subject as now exists. There is no more reason to expect a Member of Congress to be a monetary expert than to expect him to be an astronomical expert. The questions asked and statements made here to-day by members of this committee, some of them bankers of long experience, demonstrate clearly to my mind the necessity for the appointment of a commission of experts to investigate this important subject. Congress should have a critical analysis of those systems over there (Europe) before attempting to legislate. European parliaments, in appointing commissions to investigate and report on scientific subjects, invariably select experts, and that is the reason the reports of their commissions carry such weight and become so useful in formulating legislation.

NOTE.—The committee recommended the cooperation with President Taft in the use of our consuls, and nothing was done. Later we sent to Europe a commission composed of nonexperts, and no legislation has resulted from that effort and expenditure of public funds.

EXCERPT FROM THE REPORT OF J. H. CAHILL ON PERSONAL OR SHORT-TIME AGRICULTURAL CREDIT AND COOPERATION IN GERMANY, SENATE DOCUMENT NO. 17, PAGE 17.

For the provision of this form of credit in adequate amount and on suitable conditions as to interest and repayment, farmers, especially medium and small farmers, require a different credit organization from that which has been evolved for merchants and manufacturers; and for certain obvious reasons. The outstanding feature of the agricultural industry is the length of period of production. Within limits the manufacturer can hasten at will the process of production and repeat his products, or the trader can restock his store several times within the year; for the farmer the time of beginning and the time of finishing production are fixed by nature. Although the duration of the period of production may be shortened to some extent, artificial hastening processes are not applicable in most cases and lack the effectiveness of the machine in industry. In certain important branches of agriculture the period of production may extend over several years. Thus, a foal requires three or four years, and a calf two or three years before becoming utilizable or marketable. And the returns of agricultural production are more uncertain than those of commerce and industry owing to incidents of harvest, risk of disease, perishability of produce, and other causes. Another peculiarity—making due allowance for depressions and for numerous seasonable trades outside agriculture—is the irregularity of monetary returns from year to year or their tendency to fall in certain months or periods in each year. Unless his farming is mixed the farmer obtains his main receipts in autumn when he sells his crops. Under these circumstances a banking system which aims at a rapid turnover of funds and grants credits of three and four months, with one or two renewals for like periods, is of little advantage.

NOTE.—Under the Raiffeisen system of Germany alone is done the vast amount of $5,000,000,000 of business yearly, and the German farmers obtain that credit at from 3 to 5 per cent.

The Shipping Bill.

EXTENSION OF REMARKS

OF

HON. GEORGE A. NEELEY,

OF KANSAS,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, February 16, 1915.

Mr. NEELEY of Kansas. Mr. Speaker, an extraordinary situation obtains to-day. A situation without parallel in the history of the world.

We are at peace with all the world, yet our commerce is practically destroyed and industry threatened by the greatest war in history. We are to-day the only first-class civilized power in all the world at peace both at home and abroad, and none of this trouble is of our making.

The past 50 years have been the very pride of the world's existence. Never before within the span of a human life has there been so much to make for the peace, prosperity, and happiness of mankind, with the result that luxuries have become necessities, and necessities have so multiplied that every corner of the universe has been called upon to contribute its share to the comfort of the human family.

Mr. Speaker, it is a sad commentary on American industry and enterprise that, although we have grown to be the largest and most powerful Nation in the world, our shipping interests have not kept pace with our trade expansion, resulting in a very large share of our foreign commerce being carried in foreign bottoms.

When the present European war began the nations engaged in our carrying trade immediately withdrew their available vessels for their own purposes, leaving us with our bins and warehouses filled to overflowing with domestic products, paralyzing our foreign commerce, interfering with the transmission of the mails, and leaving us practically ostracized from the great consuming portion of the world. It became necessary that something be immediately done to relieve this situation, and the pending bill is the answer of the Democratic Party. Its enactment will meet the emergency. It will mark the beginning of an active campaign for commercial supremacy on the high seas and will in time make us independent of Europe and her broils; will make the Stars and Stripes known in every port on the globe, to the great glory of the American people.

The first section of the pending act provides:

That with the approval of the President the Secretary of the Navy is hereby authorized to establish one or more United States Navy mail lines, by employing such vessels of the Navy as in his discretion are available, without impairment to the paramount duties of the Navy, and as are necessary and appropriate for the purpose of establishing and maintaining regular communication between the east or west coast, or both coasts, of the United States and either or both coasts of South America and between the United States and the countries of Europe. The vessels so employed shall carry United States mail, passengers, and freight under such regulations and at such rate or rates as the Secretary of the Navy may prescribe. * * *

THE COMPANY ORGANIZED.

Sections 2, 3, and 4 provide for manning the above-mentioned Government vessels by enlistment and by transfer from the regular service, and then section 5 provides:

That the United States, acting through the shipping board hereinafter created, may subscribe to the capital stock of a corporation of the District of Columbia. Said corporation shall have for its object the purchase, construction, equipment, maintenance, and operation of merchant vessels to meet the requirements of the foreign commerce of the United States, or to charter vessels for such purposes, and to make charters or leases of any vessel or vessels owned by such corporation to any other corporation, organized under the laws of a State, a majority of the stock being owned by citizens of the United States, firm or individual, citizen or citizens of the United States, to be used for such purposes, and shall have power to carry out said objects and purposes: *Provided*, That the terms and conditions of such charter parties shall first be approved by the shipping board, the initial capital stock of which corporation shall not be over $10,000,000, of the par value of $100 per share: *And provided further*, That said corporation shall make no charter or lease of any vessel to any corporation, firm, or individual for a longer period than 12 months, and said corporation shall specify in the charter or lease the rates, charges, and fares to be observed by such corporation, firm, or individual chartering or leasing any such vessel or vessels as a maximum to be charged during the life of such charter or lease, and there shall be contained in said charter or lease a provision terminating the same whenever the charterer or the lessee shall violate any of its provisions.

POWERS OF SHIPPING BOARD.

The proposed act confers certain powers necessary to the life of the corporation, such as the power to sue and be sued, to require security from its employees, to collect the full amount of the subscription at the time it is made, authorizes the shipping board to vote the stock of the Government, requires the officers and trustees of the corporation to be citizens of the United States and subjects them to removal by a majority vote of the stockholders, exempts the corporation and its stock from taxation so long as the Government owns a majority of the stock, provides that the Government shall retain control as long as it owns any of the stock, and retains to Congress the right to alter, amend, or repeal the act.

Section 6 provides that the Government shall subscribe for 51 per cent of the capital stock at par, the balance to be offered to the public at not less than par, but reserves to the United States the right to own all the stock not subscribed for by the public.

SHALL NOT VIOLATE NEUTRALITY.

The bill also authorizes the shipping board to purchase or construct suitable vessels, using the proceeds from the sale of thirty million Panama Canal bonds for this purpose, providing that no purchases shall be made during the pending European war in such manner as to affect neutrality, the shipping board to deliver to the United States the gold bonds of the corporation, bearing interest at 4 per cent, for the amount of the advancement made by the Government.

The act further provides:

That the Secretary of the Treasury and the Secretary of Commerce, and three additional members, two of whom shall be of practical experience in the management and operation of steamships in the foreign trade, are hereby constituted a board to be known as the shipping board, with full power, subject to the approval of the President, to vote the stock of the United States in said corporation, either as a body or by one or more of its members duly authorized by a majority, and to do all things necessary, whether specifically enumerated or not, to carry out the purposes of this act and protect the interests of the United States, said three additional members to be appointed by the President, by and with the advice and consent of the Senate.

KEEP CONGRESS ADVISED.

Further provision is made for the acquisition of boats by transfer of naval auxiliaries suitable for commercial purposes; the transfer of vessels belonging to the Panama Railroad Co.; provides for a report to Congress at the beginning of each regular session; appropriates $10,000,000 additional to carry out the terms of the act, and then provides:

That two years from and after the conclusion of the present European war, that fact to be determined by the President, the corporation and the shipping board shall turn over and transfer all vessels purchased or constructed under the provisions of this act to the Navy Department, and the Secretary of the Navy shall have the right, with the approval of the President, to lease or charter any of such vessels not needed for naval or military purposes to any firm, individual, or corporation for use as merchant vessels.

THE POSTAL SYSTEM.

Some oppose this measure because they say there is no precedent for its enactment, and that it is the beginning of Government ownership. Let us see. With the multiplication of Colonies along the Atlantic coast some means of communication became necessary. At first they sent letters and packages from plantation and from hand to hand until, in 1672, Francis Lovelace, the then governor of New York, conceived a plan for the transmission and delivery of inland domestic mail, and on May 22, 1695, the governor of Maryland issued a proclamation establishing a post route "betwixt the river of Potomock in Maryland and Philadelphia in Pennsylvania," and on February 7, 1691, William and Mary granted a monopoly of the postal business of the Colonies to one Thomas Neale, Esq.

It will thus be seen that the postal business began as a private institution under the protection of the Crown nearly a hundred years before the Revolution; but the varying rates, the indifferent service, the opportunity for profit, and the demands of the times were such that in 1707 the Crown purchased the Neale patent and thenceforth until the Revolution the Postal System was a Crown institution.

When our Government was organized the fathers made provision for this favored institution in the Constitution, and it has now grown until it is perhaps the largest department of the Federal Government and the greatest business concern in the world.

THE BANKING SYSTEM.

The history of banking in this country is very similar to that of mail carrying. Beginning with a trust reposed in some person of great probity in the community, it was gradually extended to partnerships and later to corporations until it has finally reached the place where this great Government has complete supervision and control for the benefit of the whole people. The growth of the Republic and the extent of our commerce and business became such that it was necessary that a uniform system be devised sufficiently broad and comprehensive to care for every class and condition of enterprise, and the people naturally turned to this great Government to mark out the way. It has done so by taking complete charge, and stands to-day the final arbiter between the different elements that make up our business population.

THE PANAMA CANAL.

When private enterprise had become exhausted and completely discouraged with failures and there was no other place to go the same Republican Party that now attempts to block this splendid piece of constructive legislation turned to the agency that has never yet made a capital failure, and the Panama Canal became Government surveyed and Government financed. To-day under the splendid leadership of the party that proposes to establish this line of ships in aid of American commerce the Panama Canal is Government built, Government owned, and Government operated, and the Government still lives.

But this is not all. The producers of this country are going to have a Government farm-loan system Government managed for the benefit of the whole people, and when this is done they will then take up some other Government agency to better their condition.

TELEGRAPH AND TELEPHONES.

We may as well recognize the situation as it is. The time is rapidly coming when we will have Government ownership of the telegraph and telephone. The rumble of this demand is distinctly audible, and our party may as well take a stand with the people now as to have the people take a stand against it later.

If the owners of these conveniences complain they should be answered that they and they alone are responsible for this condition. Inefficient and in many instances grossly indifferent service, excessive wire toll, and telephone rates, together with a "public be damned" policy, on the one hand, and the splendid example of the Postal Department, despite the political jugglery of our predecessors, on the other, have promoted dissatisfaction and distrust that will result in placing this necessary public agency at the command of the people in every nook and cranny of this Republic to which the blessings of the Postal System have been extended.

And this is right. The only excuse for the existence of a government is that it serves the people who brought it into existence, or who permit it to exist. Governments were not designed simply to provide pleasant berths for a few favored ones, and neither were these great public agencies created for the sole purpose of piling up enormous fortunes for their owners. Whenever the time comes that the ends of human happiness are better served by dedicating them to the public service, the time has then arrived when the Government should take charge of and administer them for the benefit of the whole people.

THE IMMIGRATION VETO.

Some gentlemen find reason to criticize the President because of his action in vetoing the immigration bill upon which his party had not spoken nationally, because he at the same time urges the enactment of this legislation, but the premise is not the same. I see nothing inconsistent in the President's action, although I disagreed with him in the immigration matter and voted to pass the bill over his veto. My reason for so voting was that the immigration question had been an issue in my district, and I had pledged my constituents to support a measure embodying the principles of this measure. By their act in electing me to Congress they had instructed me to support those principles, and good faith demanded that I obey the instruction.

The facts of the case are simply these: The immigration question has been a live issue in this country for many years; in fact, practically ever since the Government was organized. There was a time when we had a political party known as the American Party, the campaign slogan of which was "America for Americans," and the chief plank in its platform demanded that immigration be greatly restricted, indeed if not absolutely prohibited.

The last session of the Sixty-second Congress saw a bitter fight over this matter in which an ineffectual attempt was made to pass a bill embodying substantially the provisions of the Burnett bill over President Taft's veto, yet with all this history and agitation the Democratic Party in its national convention declined to commit its candidates on the question and left them free to act as they saw fit. But here the situation is entirely different.

At the time of the last Democratic national convention no one even dreamed that such a situation as now exists would ever occur. The whole world was at peace when, like a mighty holocaust, comes the roar of arms, and England, France, Germany, Russia, Belgium, Austria, Turkey, Servia, and Japan are in a mighty death struggle. The Democratic national convention is not in session. It will not reconvene for over a year, and good faith with the great party whose chief he is, good faith with the American people over whose destinies he presides, and a due regard for his obligation "to faithfully execute the office as President of the United States" demands that President Wilson proceed in emergencies without waiting for the party to act.

Suppose, Mr. Speaker, that it were true that the Democratic Party could not act in emergencies until they had been submitted to the national convention; and suppose that some European nation should commit a series of overt acts designed to humiliate us, or should invade our shores with hostile armies, while we sat idly by like a bunch of nincompoops waiting for the next national convention to meet and determine what we should do. Not a single Member of this House would acknowledge allegience to a party so lacking in patriotism and leadership, and the American people would see to it that its name became only a memory.

The Splendid Record of Gen. Crozier.

EXTENSION OF REMARKS

OF

HON. WILLIAM E. HUMPHREY,

OF WASHINGTON,

IN THE HOUSE OF REPRESENTATIVES,

Monday, March 1, 1915.

Mr. HUMPHREY of Washington. Mr. Speaker, in the CONGRESSIONAL RECORD of February 15, 1915, there are recorded the extended remarks of the gentleman from Illinois [Mr. TAVENNER], which are apparently intended as an argument in favor of Government manufacture of war material as opposed to its

purchase by the Government from private manufacturers. The argument is supported by statements of excessive prices which have been paid by the Government for articles of private manufacture as compared with the cost of similar articles made in the Government's own factories. With the gentleman's ideas on this subject nobody can find any fault. He gives his views and his conclusions, and he has a right to them whether others agree with him or not. But in support of his views he uses a method of which the same can not be said. He alleges that the Government has been outrageously overcharged for years by what he calls a ring of private manufacturers; he declares that these overcharges have been permitted by officers of the Army and Navy, among whom he particularly mentions Gen. Crozier, Chief of Ordnance of the Army, through motives which, without directly stating it, he, by unmistakable inference, characterizes as corrupt.

The support of the charges against Gen. Crozier consists of certain differences between public and private costs, particularly of artillery ammunition and small-arms ammunition, some of which the gentleman mentions individually and many of which are published in tables which are incorporated in his remarks. Now, the first thing to be noted about this information which forms the basis of the gentleman's charges is that it has all been voluntarily offered and brought to the attention of the Congress by Gen. Crozier himself or by officers of his department acting for him. I do not find a single instance among the gentleman's statements where the ground upon which he stands is not thus gratuitously furnished by the man against whom he makes the charges. Gen. Crozier has furnished this information in his annual reports and in his hearings before committees of Congress. He has in these called attention to the economies in manufacture which have been effected by his department, and he has progressively, from year to year, submitted evidence of his success in reversing the common statement that private manufacturers could manufacture all the Government's material for it cheaper than could the Government itself, and secure their own profits besides. When questioned, as would be natural and inevitable as to the policy, in view of these Government savings, of patronizing private manufacturers, he has many times given his views upon the subject, to the effect that he thinks it desirable that the Government should manufacture part of each class of material which it uses, which is not also a commercial article; and he has given his reasons for his views. One of the latest occasions was at his hearing before the Military Committee of this House, when he stated as follows:

Mr. MCKELLAR. Do you not think you ought to manufacture all of your powder under these circumstances?

Gen. CROZIER. I do not think so, Mr. MCKELLAR. I only gave one reason to the chairman when he asked me a moment ago why I thought we should get some from private manufacturers.

Now, I will give you two others reasons. One of the two is that I think it is a good plan for our Government factory at Frankford Arsenal to be up against the private manufacturers, both in the matter of price and quality; that is in order to stimulate Frankford Arsenal. We have never won out at the contests for accuracy that we have annually. We have been pretty near the top a number of times, and the differences have been very small, indeed; but we have never come out ahead. I am not ashamed of our showing. I think possibly these private manufacturers have had to put a little more money in what they furnish than they would have put in it if they made it in large quantities as we do. They put more care into the making of it. Now, we furnish pretty good ammunition and plenty good enough, and it is among the best manufactured in the country. But we need that stimulus of private manufacture to keep the quality up. The quality is all the time trying, in the most curious way, to run down. The cartridge metal gets poor, the bullets are not concentric; the jacket metal is troublesome, and the loading is not accurately done if you do not watch it like a hawk all the time. I think that stimulus is very worth while.

Now, the third reason is this: Of course, I come before you every year here and make a great claim for economy of manufacture. If you have not made any comparisons, you do not know anything about it except what I tell you; and nobody can verify it without a great deal of trouble and expense. You can not go into our factories, unless you employ experts, and really tell whether the manufacture is economical or not, unless you have got something to compare it with. That is the case with reference to the small arms, the rifles themselves. The Government makes all of its rifles. I claim great economy for them. They cost us $14.40 apiece. I do not believe we could get that rifle from private manufacturers for less than $25, although I can not prove it.

Now, I can prove it with reference to this ammunition; and I think it is worth while for the country to know whether its manufactures are carried on economically; and there is no other way than the comparison of the cost price of the article.

But the gentleman from Illinois [Mr. TAVENNER] has not been dependent upon this hearing alone for information as to Gen. Crozier's reasons for his views. They were brought directly to his attention in correspondence between himself and Gen. Crozier, as I find in a letter to him from Gen. Crozier, dated September 18, 1913, which is found on page 526 of the hearings before the Appropriations Committee of this House upon the sundry civil bill for the fiscal year 1915. In this letter Gen. Crozier says:

I have never been in favor of the Government doing all of its manufacturing. I think it desirable for the officers conducting a manufacturing establishment to have the stimulus of rivalry with private plants, and I think it advantageous to have others than Government officers stimulated to an effort to improve the quality of the material. I also think it worth while to have an opportunity for comparison of costs, so that it may be known beyond doubt whether or not Government manufacture is economically carried on. It addition, there is great advantage of having in existence private plants capable of aiding in doing the increased amount of work which is necessary upon emergency.

Gen. Crozier has often, in his hearings, also said that under the influence of the lower costs demonstrated by the arsenals the prices of private manufacturers have come down, and he has illustrated these statements by examples. A conspicuous example is the price of powder, which has been brought down within recent years from a price of about 70 cents per pound to a price of about 53 cents per pound; the arsenal cost, including all overhead charges, being now about 40 cents per pound. This process has been partly one of voluntary reduction in price by the manufacturers and partly one of compulsory reduction, imposed by Congress in prescribing limitations of price. Both are undoubtedly based upon the demonstration which has been made at the Picatinny Arsenal of the cost at which it is possible to manufacture powder. Another conspicuous example of reduction of purchase price is the first article which the gentleman from Illinois [Mr. TAVENNER] mentions in support of his charges.

The gentleman states, and truly enough, since he gets his information from Gen. Crozier, that in 1913 the War Department purchased 7,000 4.7-inch common shrapnel from what he calls "the ammunition ring," paying $25.26 each, while at the same time the arsenal cost for manufacturing this article was $15.45. It now appears from Gen. Crozier's hearing before the Committee on Appropriations this year, page 177, Table II, that the price of this 4.7-inch common shrapnel has been cut down to $19.21, including cost of inspection, while the cost of their manufacture at the arsenals is $17.93, including all overhead charges. Gen. Crozier has oftentimes explained in his hearings that when a manufacture is in a new stage the prices of private manufacture are apt to be abnormally high, due to lack of knowledge of what the real costs are going to be, and has claimed that one of the most useful results of Government manufacture is the frequent demonstration to private manufacturers that the articles can be manufactured for less cost, and that the Government has a means of checking their prices.

Gen. Crozier's hearings also show the extent to which he has, in pursuance of the policy of having the Government manufacture at least a part of all the noncommercial articles which it uses, inaugurated the manufacture at the arsenals of things which had theretofore been produced only by private manufacturers, accompanied in almost every case by a material reduction both in the cost of Government manufacture and in the price paid when procured from private manufacturers. As examples he mentions automatic pistols, telescopic sights, forgings for cannon, machine guns, and armor-piercing projectiles. In other cases he has secured appropriations from Congress and has considerably enlarged the capacity of the arsenals for the manufacture of certain classes of material; for instance, he has greatly enlarged the capacity of the Rock Island Arsenal for the manufacture of field artillery guns, limbers, and caissons, and has similarly enlarged the capacity of the Frankford Arsenal for the manufacture of field artillery ammunition. One may or may not agree with Gen. Crozier in his view that the Government should patronize private manufacturers for a part of its war material; but he could not possibly have been more open in the expression of his view, nor more specific in his statement of his reasons for holding it, neither of which is subject to honest misconception. Congress itself has at different times been found upon both sides of the question. At present it is strongly favoring Government manufacture whenever possible; but a few years ago its attitude was just the other way, and there was a strong tendency to encourage patronage of private manufacturers for everything which they were fitted to produce.

The gentleman from Illinois [Mr. TAVENNER], in his unmistakable charge of corrupt motive upon the part of Gen. Crozier, endeavors to present a reason for this motive. He asserts that Gen. Crozier was formerly in partnership with the Bethlehem Iron Co., now the Bethlehem Steel Co., and he supports this charge by the statement, which is true enough, because it was also furnished by Gen. Crozier himself, that when Gen. Buffington and Gen. Crozier had brought to a stage of practicability the construction which is now generally known as the Buffington-Crozier disappearing gun carriage, upon which most of the heavy guns of our seacoast fortifications are mounted, they sold the foreign rights in the invention to the Bethlehem Iron Co., upon terms which are stated. The circumstances of this transaction are fully set forth by Gen. Crozier himself in a letter to the Hon. F. M. Cockrell, which was published in 1902 in Senate Document No. 387, Fifty-seventh Congress, first session. The reasons for the transaction are there stated to be the im-

possibility of keeping secret the principles of the invention and the belief of Gen. Buffington and Gen. Crozier that there was no reason why foreign Governments should be granted free use of it. It is the practice of the War Department to issue for the use of its own service descriptive pamphlets of material of this kind, fully illustrated, in order that its officers and enlisted men may become familiar with it. This educational process for its own people is considered to give a better return in accurate knowledge of its war material upon the part of those who use it than could be had from any attempt at secrecy. Things which the War Department endeavors to keep secret are very few in number. Having neither the time nor the means for exploiting it abroad, Gen. Buffington and Gen. Crozier sold the foreign rights to the invention to the Bethlehem Iron Co., but took care at the time to fully safeguard all the rights of the United States. These rights are not very well defined by statute. There have been presented for the consideration of Congress at various times bills for regulating the compensation which should be paid to officers in the Government service for useful inventions of which the United States avails itself, but none of them have been enacted into law. Intending that no uncertainty, either at the time or in the future, should attend the use by the Government of this disappearing carriage, Gen. Buffington and Gen. Crozier inserted in the specifications for their patent the following language:

We hereby dedicate to the Government of the United States the full right to use, to make, and to have made in the United States for its own use gun mountings embodying this invention.

The circumstances of this transaction between Gen. Buffington, Gen. Crozier, and the Bethlehem Iron Co. are not such as to constitute a partnership, or anything like it, and a charge of partnership resting upon them can not but be recognized as unsupported by the person who makes it. It is a simple business transaction, of a perfectly proper character, made in such a way as to conspicuously safeguard every public interest.

It was exploited in opposition to the confirmation of the nomination of Gen. Crozier as Chief of Ordnance and was thoroughly investigated; following which he was confirmed by what was reported at the time to be an overwhelming majority, although the vote, being taken in executive session, was not published.

Some months after Gen. Crozier's confirmation as Chief of Ordnance he voluntarily relinquished all right, title, and interest in the Buffington-Crozier disappearing carriage, not wishing, as Chief of Ordnance, to have any other than an official interest in any article of war material. For this reason he also formally relinquished his patent rights in a wire-wrapped rifle of his invention, which is largely used in the Government service, as is evidenced by the following letter from the Commissioner of Patents:

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., January 22, 1903.

Brig. Gen. WILLIAM CROZIER,
Bureau of Ordnance, War Department, Washington, D. C.

DEAR SIR: Your letter of the 20th instant is received as follows:

"Replying to your letter of the 19th instant, in which you state that the most effective way to accomplish my purpose of throwing open for the free use of all persons my patent, No. 671,879, for wire-wound guns, is by filing for record in your office among the transfers of patents an instrument relinquishing my rights under this patent and giving the invention to the public, I have the honor to state that I hereby relinquish all such rights in the aforesaid patent, and freely give the use thereof to the public. And I request that you publish a notice of this action in the Official Gazette of your office."

Complying with your request I have ordered that this letter of dedication be recorded in the assignment division of this office, and that notice of this dedication be published in the Official Gazette.

Believing that you are entitled to be thanked for this gift of a franchise to the people of the United States in general, and being acquainted with no other person who can make such acknowledgment, in their behalf will you permit me to thank you for this generous act upon your part.

Yours, very truly, F. I. ALLEN, *Commissioner.*

In his remarks the gentleman from Illinois [Mr. TAVENNER] states that the advancement of Gen. Crozier from the grade of captain when he was appointed Chief of Ordnance, passing over all the intermediate grades, "furnishes an excellent illustration of the rapid advancement possible to officers who make themselves agreeable to and are on friendly terms with war traders." As stated above, there was opposition to Gen. Crozier's confirmation. The inspiration of this opposition is believed to be known. It came from the interests of certain private parties in military inventions which it was thought that Gen. Crozier would not favor, and it was urged with the intensity which generally proceeds from this kind of motive. It brought forth a letter from the Secretary of War, giving the circumstances and reasons for Gen. Crozier's selection for his present post, which is published in Senate Document No. 387, Fifty-seventh Congress, first session, which I have before mentioned. It is from Secretary of War ROOT, the distinguished gentleman who is now a Senator from the State of New York. It is as follows:

[Senate Document No. 387, Fifty-seventh Congress, first session.]

SELECTION OF CAPT. CROZIER FOR CHIEF OF ORDNANCE.

WAR DEPARTMENT,
Washington, May 31, 1902.

MY DEAR SENATOR: I have just received your letter of to-day, asking the reasons for the selection of Capt. Crozier to be Chief of Ordnance over so many officers of greater age and longer service, and by whom he was recommended, and whether he made any application, orally or in writing, personally or through relatives or friends, for such appointment.

I am about leaving the city for several days, and reply somewhat hurriedly rather than to delay until after my return.

Capt. Crozier never applied for the appointment, directly or indirectly, personally or through anyone else; neither has he nor any other person, either in the Army or out of it, ever asked for or suggested his appointment. His appointment was recommended to the President by me solely upon the evidence furnished by his military record that he was the best man in the Ordnance Corps to fill the place and to do the work of Chief of Ordnance.

The following considerations contributed chiefly to that conclusion:

(1) Upon assuming the office of Secretary of War, in the summer of 1889, I found the Ordnance Department in a position in several respects unfortunate. The relations between that department and the officers of the Artillery had become strained almost to the extent of a chronic controversy. The same was true of the Ordnance Department and the Board of Ordnance and Fortification. Practically everything the one proposed the other opposed. Repeated attacks upon the Ordnance Department in Congress, and by officers of the Army, and by civilian inventors, had put the corps on the defensive and made it sensitive to criticism and constantly in the attitude of repelling attack. There was not the free and unprejudiced intercourse, exchange of views, and reception of suggestions between the Ordnance Corps and the other arms of the service which are essential to efficiency. I became satisfied that through the long-continued operation of these and other influences the Ordnance Corps had reached a condition of working by itself alone, confined within its own hard and fast lines, with too little initiative and too little understanding of and sympathy with the line of the Army, which was to use the implements of war that the Ordnance Corps produced.

At the same time that corps, I knew, contained a great number of able, faithful, and devoted men, doing excellent work, and capable, under proper administration and in due relations with the other arms of the service, of producing the most effective possible results. It seemed to me that the proper course to follow in the interests of the country was not to attack the Ordnance Corps, but to improve it by putting at its head the ablest, strongest, most broad-minded, vigorous, and competent administrator to be found in the corps; and it seemed to me that the situation demanded that personal considerations, which might under ordinary conditions lead to the selection of the ranking officers of the corps, ought to yield to the general requirements of the service in the selection of such a man.

(2) A careful consideration of the efficiency reports of the officers of the Ordnance Department seemed to me to clearly indicate Capt. Crozier as the man to be selected under the foregoing considerations. Although there are officers of greater age and longer service in the corps, he has served 5 years in the Artillery and 21 years in the Ordnance Corps, and is 47 years of age, and the greatest degree of initiative and energy is not usually to be looked for among men older than that. He was the officer who had the courage and skill and insight to make the report upon our coast fortifications at the outbreak of the Spanish-American War which opened the eyes of the country to their real conditions. That report not only marked him as a man of extraordinary ability, but constituted a starting point of renewed and intelligent activity in the improvement of the defense of the country.

I had carefully read the comments of officers of Artillery upon that report, and was struck by the high respect which they exhibited for its statements and conclusions and by the evidence that if its author should be made Chief of Ordnance a long step would be made toward securing that respect for the ability and insight of the Ordnance Department on the part of the Artillery which is so desirable. I inclose herewith a copy of that report and a copy of the annual report of Col. Joseph P. Storey, the inspector of Artillery of the Department of the East, commenting upon it, the officer who upon his superior merits as a scientific artillerist has now been placed in command of Fortress Monroe and the Artillery School.

Capt. Crozier before I came into office had been selected as the military representative of the United States at The Hague peace conference, and in that great international congress which remodeled the laws of war for the civilized world he acted as the competent and trusted representative of the United States, and we are not without informal evidence that his mind and character had a controlling influence upon the deliberations of that body.

Capt. Crozier served as chief ordnance officer of the China relief expedition, a difficult position, because the unknown and unascertainable conditions through which that expedition was to pass required skill, foresight, and an intimate knowledge of the needs of troops under varying and conjectural circumstances. He acquitted himself of this duty with the highest credit. In this service and in service as the chief ordnance officer in the Philippines he had acquired that intimate knowledge of the needs of the service which can be acquired only by actual service with troops in the field.

In the year 1901 I had been called upon to recommend to the President a successor to the late Peter S. Michie as professor of natural and experimental philosophy at West Point. This was regarded as the most important position connected with the institution. I requested the academic board of the academy to submit a list of officers whom they considered especially competent for the position, and Capt. Crozier's name stood high in the list among those recommended. I recommended him for appointment. He was appointed by the President and confirmed by the Senate. His appointment was received with universal approval, the other candidates themselves in several instances saying to me that Crozier was so clearly the best man for the place that they cheerfully yielded their claims to his. The recommendation and the appointment were made without any communication with Capt. Crozier, and without any request or suggestion on his part, directly or indirectly, and after confirmation he declined the appointment because he was unwilling to leave the active service of the Army in the Ordnance Department. The recommendation of the academic board and the universal approval of Capt. Crozier's appointment furnished the highest evidence of his attainments and capacity as a scientific man.

Far from considering his invention or perfection of the service disappearing gun carriage as a reason against his appointment, it appeared to me to be additional evidence of the extraordinary scope of his ability and of his possessing the qualities of a practical mechanical engineer, so important to the position of Chief of Ordnance; for I found in the report of my predecessor, Secretary Lamont, for the year 1894, and in the reports of the Board of Ordnance and Fortification, that after the Endicott Board of 1885 had adopted the principle of the disappearing gun carriage and called upon the Ordnance Department to produce and perfect a practical disappearing carriage, Capt. Crozier was the only man who accomplished the result desired by the board. Secretary Lamont said of it:

"The establishment of type disappearing gun carriages for 8-inch and 10-inch guns invented by officers of the Ordnance Corps, and believed to be unequaled for rapidity and simplicity of action by any carriage elsewhere in use, is a notable achievement of the year (1894). This problem solved, the armament of our harbors may now be prosecuted as rapidly as means are available. * * * The carriage is the combined invention of Col. Buffington and Capt. Crozier, of the Ordnance Department, and reflects credit upon the inventive skill of American officers. It is a satisfactory solution of one of the most difficult problems which has confronted military science *. * *."

This conclusion of Secretary Lamont was based upon the unanimous reports of two successive Boards of Ordnance and Fortification, under the presidencies of Gen. Schofield and Gen. Miles, and the conclusions of the Boards of Ordnance and Fortification were based upon the reports of extensive and practical tests of the carriage made by two successive boards of officers.

After examining, I think, substantially all the reports upon the subject and observing the operation of the carriage at various times at five different fortifications on the Atlantic coast, I have seen no reason to question the conclusions of the Endicott Board, of the Boards of Ordnance and Fortification above mentioned, or of Secretary Lamont.

Having in view these facts and the great range of less conspicuous service which Capt. Crozier has performed with unremitting industry during his long period of service, it seemed to me no disparagement of the able and faithful officers of longer service to say that Capt. Crozier had so especially demonstrated his fitness to perform the difficult duties of Chief of Ordnance under the existing circumstances that it was the duty of the President to select him. He is the most distinguished officer of the Ordnance Corps. He is one of the most distinguished officers of the American Army, and important as his retention of his present position undoubtedly is to him, it seems to me to be far more important for the country.

Sincerely, yours,

ELIHU ROOT.

Hon. F. M. COCKRELL,
United States Senate.

It is worth while to be attacked in order to have such a letter as this appear as part of an officer's record. I take pleasure in placing this letter against the insinuations and misleading statements of the gentleman from Illinois [Mr. TAVENNER].

As in the case of the differences in costs of ammunition and other material, all of the information in regard to this gun-carriage transaction was furnished by Gen. Crozier himself, voluntarily and over his signature. The gun carriage itself has stood the test of 20 years' use in the fortifications of the United States, and is still considered by those who are responsible for our seacoast fortifications as the best form of mounting which is known. It ran the gantlet of more extensive tests and more critical examination by boards than any article of military equipment which can now be recalled. It was heartily and unqualifiedly indorsed by the following boards, namely, the Ordnance Board; a War Department board composed of an officer of Engineers, an officer of Ordnance, and an officer of Artillery; the Board of Ordnance and Fortification; and a statutory board of Army and Navy officers and a civilian engineer. The following statement in regard to it was made by the Chief of Artillery in 1904, after it had been in use in the seacoast defenses something over 10 years:

I have no hesitation in saying that for all purposes I believe the disappearing carriages mounted on our coast to be the best service carriages on land mounts for heavy-caliber guns in the world.

So much for Gen. Crozier. Now, as to the motive for the charge which is made against him: In the speech of the gentleman from Illinois [Mr. TAVENNER], which is reported on page 4596 of the CONGRESSIONAL RECORD for March 4, 1914, as having been made on Friday, February 27, 1914, there occurs the following passage:

Gen. Crozier has from the start opposed—not openly, but from under cover—my efforts to have these two buildings—

Speaking of two buildings at the Rock Island Arsenal, Ill.—

equipped with machinery for manufacturing field artillery ammunition. If these buildings were equipped, Gen. Crozier could no longer go before the Appropriation Committees and testify that he does not have capacity in the Government arsenals to do such manufacturing, and must therefore award the fat contracts to the ammunition ring.

The gentleman himself thus supplies his motive for his attack. It appears that in his diligent efforts to commend himself to his constituents he conceived the idea of having Government money expended in his district for an ammunition plant, and that he did not succeed in persuading Gen. Crozier that this was a necessary expenditure. It appears from Gen. Crozier's hearing before the Appropriations Committee on the fortifications bill that the Government now has facilities at other places for the manufacture of all the ammunition which is appropriated for; and it appears from correspondence between him and the gentleman from Illinois [Mr. TAVENNER], which correspondence is set forth in Gen. Crozier's hearing on the sundry civil bill for the fiscal year 1915, commencing on page 525, that a similar condition existed at the time when the gentleman was endeavoring to secure Gen. Crozier's assistance in providing Rock Island Arsenal with an ammunition plant, and was brought to his attention in this correspondence. Notwithstanding the sufficiency of other plants, it is made clear by the gentleman's own statement that the resentment induced by Gen. Crozier's refusal to stand in with him in an unnecessary expenditure which he was advocating has brought upon this officer the scurrilous attack which has been made in the RECORD under leave to print.

But Gen. Crozier need not be disturbed by these distempered effusions. The motive for them is too transparent; they reflect only on those who make them. These charges, inspired by failure and disappointment, will not injure Gen. Crozier in public esteem nor in any degree dim his splendid reputation.

Stock-Raising Homesteads.

EXTENSION OF REMARKS

OF

HON. JOHN E. RAKER,

OF CALIFORNIA,

IN THE HOUSE OF REPRESENTATIVES,

Monday, January 18, 1915.

The House had under consideration H. R. 15799, a bill to provide for stock-raising homesteads, and for other purposes.

Mr. RAKER. Mr. Speaker, the pending bill (H. R. 15799) providing for a stock-raising homestead is one of much importance to the West. The first section provides that it shall be lawful for any citizen qualified to make entry under the homestead laws of the United States to make a stock-raising homestead of not exceeding 640 acres upon the unappropriated, unreserved public lands in reasonable compact form. The land upon which entry is to be permitted shall be designated by the Secretary of the Interior as "stock-raising lands."

One of the purposes of the bill is to restore and improve the grazing capacity of the lands, and therefore stock raising and meat-producing capacity of the semiarid lands of the West, and at the same time to furnish homes thereon for the people of this country who are desirous of acquiring a home in the semiarid country.

It was presented to the Committee on Public Lands of the House having charge of this legislation in statements of officials of the Department of the Interior and the Department of Agriculture, that all unappropriated public lands in the semiarid States, exclusive of Indian, forest, military, park, and other reservations, the enormous total in round numbers was 330,000,000 acres.

It also appears that the area of public lands in these States now included in forest reservations alone amounts in round numbers to 165,000,000 acres.

It is agreed on all sides that further legislation on the semiarid lands is necessary and needed now to stop the further destructive use of such lands and secure for the future their highest and best use for our own people. To accomplish this end the stock-raising homesteads, as provided for in this new legislation, giving to each settler a home on such lands with sufficient acreage to support his family by combining forage farming, is the way to accomplish the desired results with stock raising. It is an established fact that on the lands under consideration homesteads of 160 acres, or even of 320 acres each, are not sufficient to support a family, and the concensus of opinion is that at least 640 acres is necessary to each stock-raising homestead.

It is the object, as far as may be practicable, to adhere to the time-honored plan of using the public domain to furnish homes to the citizens of our country. It is generally conceded that these semiarid lands, where by combining farming of dry-land forage crops and the raising of cattle or sheep, 640 acres will support a family. This plan for providing homes is best for the Nation as a whole, as it tends to increase the supply of cattle and sheep and at the same time lower the price of meat—a universal necessity, especially to the laboring classes—and because it affords an outlet to the congested civic and labor centers of our population without driving home seekers to take advantage of the liberal land laws of Canada. Moreover, the Nation as a unit needs more States where each citizen is the sovereign of a portion of the soil, the owner of his home, and

not a tenant of some distant or other landlord—a builder of schools and churches, a voluntary payer of taxes for the support of his local and State government.

This homestead plan is best for the semiarid West. It takes homes to insure permanent settlers and taxpayers. It takes homes to build churches and towns that attract laborers and mechanics. Population invites railroads, which in turn bring more immigration and capital to develop the resources of this great semiarid West.

This bill has all of these objects and purposes in view.

The Secretary of the Interior is authorized, on application or otherwise, to designate as stock-raising lands, subject to entry under this act, lands the surface of which is, in his opinion, chiefly valuable for grazing and raising forage crops, and which do not contain merchantable timber, that are not susceptible of irrigation from any known source of water supply, that are of such character that 640 acres are reasonably required for the support of a family; and it is further provided that the Secretary shall not designate for entry any lands under the act, owing to the general character or general conditions, that, in his opinion, 640 acres clearly will not support a family.

When the Secretary of the Interior designates the stock-raising lands subject to entry under this act, they may be applied for and entered. The qualified homestead entryman who makes homestead entry under this law, not exceeding 640 acres, by compliance with the terms of the homestead law, but instead of the usual cultivation, as required by the present homestead laws, shall be required to make permanent improvements on the lands entered before final proof of the value of $1.25 per acre, which shall be done within three years from the date of entry.

It further provides for any homestead entryman of the character described, who has not made final proof upon his existing entry, that he shall have the right to enter an amount of contiguous lands of the same character which will not exceed with his original entry 640 acres.

His residence upon the original entry is sufficient for both entries, although additional improvements must be made upon the additional entry to the amount of $1.25 for each additional entry.

Another very important provision is, although the person has submitted final proof or received patent for the lands of the character described in the bill under the homestead laws, and who still owns and resides upon the lands so acquired, may make an additional entry for and obtain patent for contiguous lands designated for entry under this act, together with the amount of his original homestead; but the land, together with the amount acquired under this act, shall not exceed 640 acres, upon proof of the expenditure required on account of permanent improvements upon the additional entry only.

The bill contains another very wholesome provision. When it is found that there is not contiguous lands adjoining the original homestead, the person who has received the homestead patent, or still owns and resides upon his land, to complete an entry of 640 acres he is given the right to enter other lands within a radius of 10 miles of his first entry which shall not exceed 640 acres, including the original and subsequent entry. All contiguous land must be taken before noncontiguous land within the radius of 10 miles can be applied for or entered by the original homesteader or patentee.

Still another most salutary provision is contained in this bill, wherein the homesteader who has acquired lands of the character described, the area of which is less than 640 acres, and who is unable to exercise the right of additional entry upon contiguous lands or within the 10 miles radius, he may relinquish to the United States the land so acquired and in the proper land office reenter and acquire 640 acres of lands of the character provided for by this act as though his former homestead and relinquishment had not been made. The homesteader or patentee who is entitled to an additional homestead shall for 30 days after the designation of the lands subject to entry under the provisions of this bill have the preferential right to make such additional entry.

The land so relinquished or reconveyed shall thereafter be subject to disposition only on such terms and conditions and under such rules and regulations as the Secretary of the Interior may prescribe.

Where there is not enough contiguous lands for two or more entrymen or patentees, then the Secretary shall make an equitable division of the lands among the several entrymen or patentees.

Another provision of the bill authorizes any person who has acquired title to land of the character referred to in the act under the homestead laws, and who is still the owner and occupant of the land, to purchase not exceeding 320 acres of stock-raising lands, which is contiguous to his homestead, upon paying the sum of $1.25 per acre. This is to be governed by rules and regulations prescribed by the Secretary of the Interior, but homesteader or patentee is not permitted to acquire any lands by purchase, or any lands together with the lands already owned and acquired under the homestead laws, which shall exceed 640 acres.

Because of the large quantity of land being permitted to be entered by the homesteader or patentee under this act, all coal and other minerals are reserved to the United States, and permission is granted for the purpose of mining such coal and other mineral deposits if at any time later discovery thereof is made.

If any damage or injury is done to the homesteader or patentee he is to be fully recompensed therefor, such as damage to crops or other tangible improvements, and a reservation, as to coal and other minerals, is to be in the patent when issued, reserving such coal and other minerals and the right to enter and prospect and remove the same; the Secretary of the Interior is given power to provide all necessary rules and regulations in harmony with the purposes and provisions of the act, to the end that it may be fully and properly carried into effect.

It will be observed that many defects are corrected by this legislation, and it will be indeed a day of congratulation for the Western States when the bill is finally enacted into law.

I have at all times been an active supporter of this legislation. The Committee on the Public Lands of the House, of which I am a member, gave long and careful consideration to this legislation, to properly perfect it.

I firmly believe that this legislation will have an important bearing upon the early development of the semiarid lands of the West, and that its beneficial effect will be evidenced within a short time after the bill is finally passed and its provisions are in full force and operation.

This legislation will fully answer those, if there are any yet remaining in this country, who have contended that public lands should be leased.

We want homes and not tenants, even if the Government of the United States should be that landlord. If water should be later discovered by boring deep wells, then so much the better. The pioneer, who has gone through all the hardships and privations, will be the man to be benefited. We hope he may.

Western Judicial District of South Carolina.

EXTENSION OF REMARKS

OF

HON. WYATT AIKEN,

OF SOUTH CAROLINA,

IN THE HOUSE OF REPRESENTATIVES.

Saturday, February 27, 1915.

Mr. AIKEN. Mr. Speaker, a few days ago I called up for passage House bill 20894, on the Unanimous Consent Calendar, providing for a judge, and so forth, for the western judicial district of South Carolina. At that time objection was made. The bill is on the Union Calendar, and I propose to move to suspend the rules and pass the bill. I am sure the following will prove interesting, for it is reliable data from the Department of Justice:

The State of South Carolina is now divided into two judicial districts under the provisions of sections 69 and 105 of the Judicial Code. This was distinctly decided by District Judge Smith in the United States district court at Charleston at the December term, 1913, in the case of Emily S. Cleckley and Annie M. Spear against the United States. By section 1 of the Judicial Code every distinct judicial district in the United States has at least one judge except the two districts of South Carolina, the two districts of Mississippi, and the eastern and middle districts of Tennessee. But the whole State of Tennessee—that is, the three districts of Tennessee—has two judges. In Mississippi each district has a district attorney (sec. 767, R. S.), marshal (sec. 776, R. S.), and other officers (act June 15, 1882, ch. 218); so that South Carolina is the only State in the Union which is divided into two judicial districts and yet has only one judge and other court officers for the whole State.

An examination of the records of the clerk of the United States court in South Carolina will show that for the past 25 years three-fourths of the criminal cases and nearly one-half of the civil cases arose in the western district of South Carolina.

Yet the headquarters of the United States court, residence of the judge, district attorney, marshal, and other officers are fixed at Charleston, and all the records are kept at Charleston, 250 miles away from where the bulk of the business is. It is necessary, however, for a district judge to be in Charleston nearly all the time on account of the admiralty business arising on the seaboard, as important matters respecting shipping, maritime business, libeling and detention of vessels, and other matters, which require immediate attention.

Important matters respecting shipping, maritime business, libeling, and detention of vessels and other matters which require immediate attention are arising and likely to arise at any time. It is therefore manifestly impossible that the present district judge can do otherwise than remain most of the time at Charleston, nor can he spend any considerable portion of his time in the western district. At present only two terms of court are held in the western district, to wit, at Greenville in April and October. As soon as the term is completed the district judge is compelled to return to Charleston, so that the larger part of the year, whenever any matter comes up in the western district in bankruptcy, motions at chambers, and other matters it becomes necessary for the attorneys and litigants to take long and extensive trips from one end of the State to the other.

Prisoners who may be arrested in the western district on bench warrants have to be transported to Charleston at great expense to the Government for sentence or else lie in jail till court meets again in Greenville. In this statement no reflection is intended upon the present district judge, who is an able, hard-working judge, and does everything he can to minimize the disadvantages of the arrangement under the present law.

Formerly a part of the business of South Carolina was conducted before the circuit judge. But under the Judicial Code the circuit court business is now transferred to the district court. The circuit judge therefore practically does not transact any of the business in this State, but his time is wholly taken up in the circuit court of appeals. Moreover, the district judge from this district is frequently called to sit in the circuit court of appeals. On such occasions there is no judge in South Carolina who can be reached in case of emergency. If South Carolina had a judge for each district, whenever one is called into the circuit court of appeals, provision could be made for the business of both districts to be transacted by the other, so that at all times there would be a judge within the State within reach.

Under the law at present only two terms of United States courts are held each year in the western district, viz, at Greenville in April and October. In the eastern district, however, which does not have near so large a business, two terms are held at Charleston, to wit, in November and January. The eastern district covers very little more territory than the western district, has no larger population, does not have near so much business for the Federal courts, and yet they have United States courts in the eastern district sitting in three different places and holding five terms in each year, while in the western district, the United States courts sit only twice a year and at one place. It is evident that to give the people of the western district the facilities to which they are entitled, the court should sit at one or two other places at least in the western district. This would bring the courts closer to the people and be a great saving in mileage of witnesses, jurors, marshals, and so forth, transportation of prisoners, both to the Government and to the people who have business in the court. But, if additional terms are provided for the western district and only one set of court officers provided for both districts, they would then have to hold about 9 or 10 terms a year, and the work would be entirely too heavy for one set of officers. Additional court officers should, therefore, be provided for the western district.

The western district embraces the Piedmont section, which in the past 10 years has shown such remarkable development in manufactures, agriculture, and all the avocations of life. This growth will continue for many years. With the growth of the country, the business of the courts has increased and will continue. The people of the western district feel that they are entitled to better facilities. The demand for additional court officers has been made from time to time for several years and grows more and more urgent each year. It is but fair to the progressive, intelligent people of the western district that attention should be given to their claims and that they should be given facilities at least as good as those afforded the eastern district of this State and other districts of the United States. They feel that having the territory and population they have and having by far the greater part of the business of the United States courts, they should not any longer be tied to the eastern district, but that they should have a judge and other court officers residing in their own district, near at hand in case of emergency, that they may have terms of court at other places than Greenville, in order that the courts and the people may be brought closer together and all lingering prejudices that may exist against the United States courts be entirely removed.

There can be no doubt that where there are two judicial districts it is to the interest of the Government and the public that court officers should be provided for each district. It is exceedingly troublesome for one set of officers to carry on the business of separate districts, keep separate records of each, and troublesome questions are constantly arising under such an anomalous system. The interests of the people of the western district demand an additional judge more strongly than they do the other court officers, such as district attorney, marshal, and so forth. But as a practical question, while it would be possible to transact the business with an additional judge only and without the other court officers referred to, yet such a system would be so inconvenient that there can be no doubt that the best course is for Congress to provide for a judge and for all court officers for the western district, so that each district in the State will have its full working machinery. The best results can only be obtained by having the two districts entirely distinct and each with its full corps of separate and distinct officers.

I invite careful attention to the following comparative statements:

[1] Attorney. [2] Marshal.

In South Carolina (population, 1,515,400) there is but one United States attorney and one United States marshal, the salaries of each being $4,500.

The population of South Carolina (census 1910) exceeds that of 45 out of the 58 districts above mentioned. The population of South Carolina exceeds the combined population of the northern and southern districts of Alabama; the four districts in Alaska; lacks less than 60,000 of exceeding the combined population of both districts in Arkansas; exceeds the combined population of both districts in Florida; lacks less than 141,000 of exceeding the population of both districts in Louisiana, and about the same of exceeding the population of both districts in Oklahoma; exceeds the combined population of both the middle and western districts of Tennessee; exceeds that of both dis-

tricts in the State of Washington and both those in West Virginia.

Compared with the 23 States above, divided into two or more districts, and Alaska, the State of South Carolina clearly exceeds in population three of those States, to wit, West Virginia, Washington, and Florida; also Alaska; while its population is approximately as large as either of four other States which have two districts, viz, Arkansas, Louisiana, Oklahoma, and Mississippi.

The extreme length of the State of South Carolina is 215 miles and its extreme breadth 235 miles. In length from north to south it exceeds either Iowa, Kentucky, North Carolina, Ohio, Oklahoma, Pennsylvania, Tennessee, or Virginia, all of which have been divided into two or more districts, Pennsylvania and Tennessee having three districts each and the others two. In breadth, from east to west, it exceeds Alabama, with three districts; Illinois, with three districts; Mississippi, with two districts; Ohio, with two districts; and West Virginia, with two districts; and South Carolina exceeds the latter State in total area by 5,790 square miles.

It is thus seen that if population and area, especially considering the peculiar shape and dimensions of a State, are factors in determining the creation of districts, then South Carolina certainly has those factors in her favor to a convincing degree.

Another factor to be considered is the diversified vocations and industries of its more than a million and a half citizens, covering almost every business and calling known to civilization. Within its domains are mountaineers and seamen. Those of the piedmont, middle country, and lowlands. The cotton manufacturer and the cotton producer, the apple grower and the rice planter, the sheep raiser and the sugar cane planter, the factory employee and the lumberman, the stock raiser and the turpentine maker, the manufacturer of "mountain dew" and the seaside hotel keeper. Its a far cry from the Blue Ridge mountaineers in Pickens and Oconee Counties to the truck grower in Beaufort, Georgetown, or Horry Counties on the Atlantic Ocean, or to the cotton factor at Charleston who exports thousands of bales of cotton in tramp steamers to every foreign country. As the soil and climate in the western and northwestern part of the State differ from those in the eastern and southeastern section, so the industries and vocations of the people differ. Obviously the judicial business will correspondingly differ, both on the civil and criminal side of the court. To transport a mountaineer "moonshiner" to the seaport city of Charleston to try him would be (to him) like transporting him beyond seas. To hear admiralty and maritime causes in the Piedmont would be as incongruous.

South Carolina has more than 150 miles of seacoast, largely more than Georgia, Alabama, and Mississippi together. Georgia has two districts, so has Mississippi, and Alabama three. Of other States divided into two or more districts, the following have no seacoast: Arkansas, Illinois, Iowa, Kentucky, Michigan, Missouri, Ohio, Oklahoma, Tennessee, West Virginia, and Wisconsin.

A fair comparison of the business before the United States courts in South Carolina with that transacted in the districts of the 23 States—which have two or more districts therein—shows that the need for two districts in South Carolina is as great, or greater, than in most of the others. It is not practical here to give all the statistics in detail, but a few comparisons will suffice to show the correctness of the above statement. During the fiscal year ended June 30, 1913, there were 155 criminal prosecutions terminated or finally disposed of in South Carolina, while in the southern district of Alabama there were 41; Alaska, first division, 65; second division, 43; third division, 21; fourth division, 58; southern district of California, 127; northern district of Florida, 65; southern district of Florida, 51; northern district of Iowa, 96; eastern district of Louisiana, 74; western district of Louisiana, 44; eastern Missouri, 97; middle Pennsylvania, 46; western Pennsylvania, 63; northern Texas, 80.

During that year the fines, forfeitures, and so forth, imposed in South Carolina amounted to $10,625.22, while in the southern district of Alabama they amounted to $2,551.34:

First division of Alaska	$2,590.00
Second division of Alaska	850.00
Third division of Alaska	1,350.00
Fourth division of Alaska	910.00
Southern district of California	8,725.00
Northern district of Florida	1,922.62
Southern district of Florida	1,765.00
Northern district of Iowa	8,624.17
Eastern district of Louisiana	6,026.56
Western district of Louisiana	1,225.00
Eastern Missouri	10,469.64
Middle Pennsylvania	3,531.74
Western Pennsylvania	1,659.40
Northern Texas	3,709.75

During the same fiscal year the civil cases to which the United States was a party which were terminated or finally disposed of in the United States courts in South Carolina totaled 35, while they numbered in—

Northern Alabama	11
Middle Alabama	9
Southern Alabama	9
Division No. 1, Alaska	7
Division No. 2, Alaska	2
Division No. 3, Alaska	0
Division No. 4, Alaska	0
Eastern Arkansas	18
Southern California	18
Northern Florida	14
Southern Georgia	18
Southern Illinois	8
Eastern Illinois	31
Southern Iowa	17
Western Kentucky	13
Western Louisiana	23
Western Michigan	20
Northern Mississippi	19
Southern Mississippi	18
Northern New York	11
Eastern North Carolina	6
Eastern Tennessee	7
Middle Tennessee	12
Northern Texas	16
Eastern Texas	15
Northern West Virginia	7
Southern West Virginia	10
Eastern Wisconsin	10
Western Wisconsin	12

The amount of judgments in civil suits during said fiscal year (1913) was in—

South Carolina	$3,964.46
Northern district of Alabama	2,845.00
Middle Alabama	434.46
Southern Alabama	1,777.72
Division No. 2 of Alaska	----------
Division No. 3 of Alaska	----------
Division No. 4 of Alaska	----------
Northern district of Florida	1,415.91
Southern district of Georgia	1,800.00
Southern district of Illinois	1,270.95
Southern district of Iowa	2,385.93
Western district of Kentucky	100.00
Western district of Michigan	1,200.00
Northern district of Mississippi	1,600.00
Eastern district of North Carolina	500.00
Eastern district of Tennessee	400.00
Middle district of Tennessee	666.29
Northern district of Texas	1,973.65
Eastern district of Texas	1,679.15
Northern district of West Virginia	600.00
Eastern district of Wisconsin	323.75
Western district of Wisconsin	1,945.01

In South Carolina there were pending at the beginning of the fiscal year 15 suits in admiralty and 9 more were commenced during that year, making a pending total of 24 admiralty cases, 10 of which were terminated and judgments were rendered for plaintiffs in the sum of $15,672.02. Out of the 23 States that have been already subdivided into two or more districts there were no admiralty cases in the following districts so subdivided:

Northern Alabama, middle Alabama, western Arkansas (1 case in eastern Arkansas), northern Georgia, northern Illinois, southern Illinois, northern Iowa, southern Iowa, western Louisiana, eastern Michigan, northern Mississippi, western district of North Carolina, eastern Oklahoma, western Oklahoma, middle Pennsylvania, eastern Tennessee, northern Texas, western Texas, western district of Virginia, eastern Washington.

During the fiscal year there were in South Carolina 18 field deputies busily engaged in serving process, warrants, and so forth, who earned $4,604.80 in net fees. These field deputies, like the number of deputy sheriffs in a county, reflect to a large extent the amount of business done, particularly so with field deputies who are engaged principally in arresting criminals.

The number of regular field deputies required during the fiscal year to serve process, warrants, and so forth, in the 23 States which contain two or more districts are as follows:

Northern Alabama	0
Middle Alabama	0
Southern Alabama	0
Eastern Arkansas	5
Western Arkansas	0
Northern California	1
Southern California (for 9 days)	1
Northern Florida	5
Southern Florida	2
Northern Georgia	15
Southern Georgia	0
Northern Illinois	0
Eastern Illinois	3
Southern Illinois	0
Northern Iowa	0
Southern Iowa	0
Eastern Kentucky	16
Western Kentucky	0
Eastern Louisiana	0
Western Louisiana	0
Eastern Michigan	0
Western Michigan	1

Northern Mississippi	7
Southern Mississippi	0
Eastern Missouri	0
Western Missouri	0
Northern New York	5
Eastern New York	0
Southern New York	0
Western New York	0
Eastern North Carolina	14
Western North Carolina	0
Northern Ohio	0
Southern Ohio	0
Eastern Oklahoma	0
Western Oklahoma	0
Eastern Pennsylvania	0
Middle Pennsylvania	0
Western Pennsylvania	1
Eastern Tennessee	0
Middle Tennessee	7
Western Tennessee	8
Northern Texas	0
Eastern Texas (temporary)	3
Southern Texas	3
Western Texas	0
Eastern Virginia	0
Western Virginia	16
Eastern Washington	0
Western Washington	0
Northern West Virginia	3
Southern West Virginia	5
Eastern Wisconsin	0
Western Wisconsin	0

Compared with the above 19 districts wherein field deputies are required, the fees earned by the field deputies in South Carolina exceed those in all but 7 of the other said districts, as follows:

South Carolina	$4,604.80
Eastern Arkansas	3,959.32
Southern California	3.00
Northern Florida	1,756.47
Southern Florida	551.34
Western Michigan	2.00
Northern New York	2,858.95
Western Pennsylvania	199.94
Middle Tennessee	2,176.36
Western Tennessee	425.50
Eastern Texas	86.92
Southern Texas	1,703.81
Southern West Virginia	4,243.40

There are also three office deputies in South Carolina, and a varying number in other districts.

There are 28 United States commissioners required in South Carolina, each of whom acts as a committing magistrate. The fees of United States commissioners reflect the business transacted by them, and compared with the other 23 States wherein there are two or more districts, the fees in South Carolina exceeded those in the following districts:

South Carolina	$2,558.70
Northern Alabama	2,515.40
Southern Alabama	475.10
Northern California	2,124.80
Southern California	1,230.55
Northern Florida	779.04
Southern Florida	854.07
Southern Georgia	1,200.01
Northern Illinois	1,994.40
Eastern Illinois	744.10
Southern Illinois	891.40
Northern Iowa	1,110.15
Southern Iowa	1,496.40
Western Kentucky	1,233.35
Eastern Louisiana	543.25
Western Louisiana	141.80
Eastern Michigan	1,352.75
Western Michigan	$104.10
Southern Mississippi	427.00
Eastern Missouri	1,366.30
Western Missouri	1,488.00
Northern New York	687.85
Eastern New York	849.60
Southern New York	924.30
Western New York	934.80
Western North Carolina	2,178.40
Northern Ohio	1,448.90
Southern Ohio	879.45
Western Oklahoma	915.30
Eastern Pennsylvania	1,095.02
Middle Pennsylvania	237.75
Western Pennsylvania	330.40
Eastern Tennessee	1,917.15
Middle Tennessee	1,298.40
Western Tennessee	777.10
Northern Texas	940.13
Eastern Texas	256.30
Southern Texas	1,176.45
Western Texas	2,452.05
Eastern Virginia	534.05
Eastern Washington	1,666.50
Western Washington	1,050.05
Northern West Virginia	1,355.90
Southern West Virginia	1,274.95
Eastern Wisconsin	712.85
Western Wisconsin	232.40

The amount for fees of necessary witnesses in South Carolina during the fiscal year 1913 was $10,204.70, which exceeded the amount for witnesses in the following districts in States where there are two or more districts: Middle Alabama, southern Alabama, northern Florida, southern Florida, southern Illinois, northern Iowa, southern Iowa, western Kentucky, eastern Louisiana, western Louisiana, western Michigan, northern Mississippi, southern Mississippi, northern New York, eastern New York, western New York, eastern North Carolina, western North Carolina northern Ohio, eastern Pennsylvania, middle Pennsylvania, western Pennsylvania, middle Tennessee, western Tennessee, northern Texas, eastern Texas, southern Texas, eastern Virginia, northern West Virginia, southern West Virginia, and eastern Wisconsin.

It would seem to be entirely unnecessary to multiply comparisons to show that if population, area and dimensions, diversified nature, and amount of judicial business transacted are to be considered, then South Carolina is justly entitled to an additional judge, attorney, and marshal—fully as much so, if not more so, than a number of other States which have been subdivided into two or more districts and have already two or more complements of court officials.

THE LAW.

The State of South Carolina has already been divided into two judicial districts by the act of February 21, 1823 (3 Stat., 726), which act was carried into the Revised Statutes of 1878 as section 546, wherein it is provided that—

> The State of South Carolina is divided into two districts, which shall be called the eastern and western districts (of the district) of South Carolina. The western district includes the counties of Lancaster, Chester, York, Union, Spartanburg, Greenville, Pendleton, Abbeville, Edgefield, Newberry, Laurens, and Fairfield as they existed February 21, 1823. The eastern districts includes the residue of said State.

The original act, approved February 21, 1823, is as follows:

> An act to divide the State of South Carolina into two judicial districts.
>
> *Be it enacted, etc.*, That the State of South Carolina be, and the same is hereby, divided into two districts in the manner following, that is to say: The districts of Lancaster, Chester, York, Union, Spartanburg, Greenville, Pendleton, Abbeville, Edgefield, Newberry, Laurens, and Fairfield shall compose one district, to be called the western district, and the residue of the State shall form one other district, to be called the eastern district.

Then follows names of places for holding court, not material here.

That act provided clearly that the State should be and was divided into two districts, not that the district of South Carolina should be divided into two districts. The act also specified that certain counties (or "districts," as the counties were then called) should be called the western district, and that "the residue of the State shall form one other district, to be called the eastern district." Could anything be plainer? Was or is it possible to use more definite and precise words to divide a State and establish therein two judicial districts than was employed in the act approved by the President February 21, 1823?

Other acts of Congress subsequently have recognized the existence of two judicial districts in South Carolina. (See act of April 26, 1890 (26 Stat., 71), sections 2 and 3 of the act of December 21, 1898 (30 Stat., 769), and section 105 of the Judicial Code approved March 3, 1911 (36 Stat., 1135).

Section 767 and 776, Revised Statutes, also recognize that fact, but said sections provide that (767) "the district attorney for the eastern district of South Carolina shall perform the duties of district attorney for the western district of said State," and (776) that "the marshal for the eastern district of South Carolina shall perform the duties of the marshal of the western district of said State." Thus, while there are two districts in the State, there is only one judge, one attorney, and one marshal, a most extraordinary, unusual, and anomalous condition. The restrictive or prohibiting provisions in sections 767 and 776, Revised Statutes, are apparently the work of the codifiers and originated in their fertile brains. The law in force at the time provided for a full complement of officials in each district. Section 35 of the act of September 24, 1789 (1 Stat., 92), expressly provides that "there shall be appointed in each district a meet person learned in the law to act as attorney for the United States in such district," and section 27 of the same act (p. 87) provides specifically that "a marshal shall be appointed in and for each district."

The Judicial Code approved March 3, 1911, provides in chapter 5, sections 69 and 105, as follows:

> The United States is divided into judicial districts as follows (sec. 69):
>
> "The State of South Carolina is divided into two districts, to be known as the eastern and western districts of South Carolina. The western district shall include (naming various counties). The eastern district shall include (naming various counties)."

Section 1 of the Judicial Code provides that "there shall be one judge for the eastern and western districts of South Carolina." Simply more prohibitory and restrictive work of the codifier.

It is absolutely clear and certain that the law as it now stands provides for two districts in South Carolina, and it seems equally clear that through the voluntary and gratuitous activities of the codifiers prohibitory and restrictive provisions have been introduced into the Revised Statutes and into the Judicial Code limiting the two districts in South Carolina to only one set of court officials. Congress adopted the codes as a whole, but by no separate act originating in the ordinary manner, well known in legislating upon important matters, has Congress so deprived the two districts in South Carolina of their rightful number of court officials accorded by the acts of September 24, 1789, supra, and February 21, 1823, supra, which acts have never been expressly repealed.

It would seem eminently proper for Congress to correct the wrong imposed upon South Carolina by the codifiers, and perhaps unwittingly sanctioned by Congress, by now passing an act providing for a full set of judicial and court officials for the eastern and for the western districts of South Carolina, respectively, each official with like salary, emoluments, fees, and allowances as are now paid to like officials of the United States courts in that State. Such action, though tardy, would be welcomed by all fair-minded citizens as according to that State her just due, and extending to her the same liberal treatment already long since extended to her sister States of like importance.

Stock-Raising Homesteads.

EXTENSION OF REMARKS

OF

HON. MOSES P. KINKAID,

OF NEBRASKA,

IN THE HOUSE OF REPRESENTATIVES,

Monday, January 18, 1915,

On the bill (H. R. 15799) to provide for stock-raising homesteads, and for other purposes.

Mr. KINKAID. Mr. Speaker, I am heartily in favor of the enactment of this bill. I believe if its provisions shall become law it will prove a great boon to thousands of home seekers, not merely home seekers in the semiarid West and in the Mountain States, where the act will apply, but home seekers throughout the United States.

Mr. Speaker, the operation of the provisions of this bill duly enacted into law need not be an experiment; substantially the same provisions have now been in operation in Nebraska for more than 10 years. April 28, 1904, the Congress was generous enough, considerate enough, and farseeing and wise enough to enact the bill introduced by me permitting a one-section homestead of the remaining public lands in the State of Nebraska. At that time the records of the Department of the Interior disclosed that about 9,000,000 acres were subject to the act, but, in my judgment, approximately 2,000,000 more acres were made subject to the act by cancellations of entries that had been abandoned for from 1 to 20 years or more, thus making perhaps 11,000,000 acres in Nebraska which were subject to the one-section homestead law. The records of the General Land Office now show that of this vast area, say, 11,000,000 acres, less than 200,000 acres of public lands now remain in Nebraska subject to homestead entry, and this consists in the main of tracts and subdivisions inadequate in size for a home stead entry, and which are subject to sale under the isolated-tract act at not less than $1.25 per acre.

Mr. Speaker, has the operation of the Nebraska act proved a success? While this has been more or less a disputed question outside of Nebraska for the last 10 years, there has remained very little room for dispute within the territory covered by the act. Subjected to the same kind of a test as is observed in the courts to determine the character of an individual when it may be in issue, which is the judgment of his neighbors who come in daily contact with him, the operation of the one-section homestead law in Nebraska has proved a marked success. The consensus of opinion of those who live within the area covered by the act, including homesteaders themselves, their neighbor farmers and ranchmen and the business people in towns with whom they deal, is that no other law has ever proven so great a benefit to the State as this.

Mr. Speaker, in 1904 when the Nebraska act was passed the public-land question constituted the greatest problem of any required to be solved by the Congress for the good of Nebraska. I shall not go into detail as to the then existing conditions, but let answer the present purpose to say that the one-quarter section unit for the most part of the area of our State, where the remaining public lands were then to be found, had proven inadequate in size for the support of a family, and the result was that the most of the entries made were commuted and sales and transfers of title were made so soon as title had been perfected, and the lands fell into the hands of speculators or large ranchmen. The result was the contrary of what should occur and what ordinarily takes place in a new country. Instead of increasing population and development in due proportion, settlement decreased and the large land holdings were added to by sales made at low prices of homesteads and preemptions, as patents were issued therefor. Did the towns grow? The small towns grew smaller; frame buildings were not repainted; stores and shops were abandoned; hotels, livery barns, and lumberyards here and there were given up. This was the rule as to a large part of the area of more than the west half of Nebraska.

Mr. Speaker, the highly favorable effect of the operation of the one-section homestead act in Nebraska was immediate. The towns at once took on new life. The businesses of hotel keeping, livery, and lumberyards were immediately reestablished and revived and prospered as the settlers came and availed themselves of four quarter sections for their entries instead of one quarter section, which had been the limit under the old régime. But notwithstanding the many obstacles thrown in the way of the act; notwithstanding it was severely criticized, censured, and condemned by papers representing large interests and in behalf of large interests, which circulated over the West; notwithstanding the operation of the act arrayed against itself those whose interests, direct and indirect, had been unfavorably affected, the measure continued to grow in popularity and has ever since continued to gain in the favorable estimation of the people who live in the territory covered by the act. The fact is the measure is now about universally agreed by all the different interests and elements of Nebraska to have brought the greatest benefit to the State of any law that has ever been passed. It is now commended by homesteaders upon their claims and well-developed farms, and just as enthusiastically by the business people in the towns where they deal. Added to these large ranchmen, many of whom at the start regarded it as a radical and revolutionary measure, viewed from the standpoint of what had hitherto existed, nearly every one, if not all, now grants that it constitutes the best legislative solution that could have been made of the public-land problem, which had become a serious economic problem when my bill was introduced.

Mr. Speaker, just as the issue arose when the pending bill was up for consideration with the Public Lands Committee, the question of whether it should be an enlarged homestead or an act for the leasing of the public lands, these same alternatives were presented at the time my bill was introduced. These were the two alternatives—an act for the leasing of the remaining public domain, which would in its effect have forbidden settlement, development, and home building, or an act for a homestead sufficiently large to sustain a family. I am frank to say I did not hesitate in making my choice in favor of the enlarged homestead. It is true I introduced a bill providing an entry might contain two sections; had I not done so it is not improbable that my bill would have been amended to permit of not exceeding one-half section, as the committee did reduce the area by one-half by amending the bill allowing one section instead of two sections.

Mr. Speaker, it is pertinent to add that as a direct and an indirect result of this one-section homestead law the population of the territory covered by the act has been increased by about 100,000; but I do not pretend that it is practicable to ascertain accurately what the increase has been, for the reason that all the while since the act has been in operation thousands have emigrated from western Nebraska to other parts of the United States and to Canada.

I should add that instead of the decline in values of the lands to which title had passed, as some scary persons predicted would be the case, the effect was to increase land values, and values have constantly continued to grow higher as the remaining public land has been entered by the newcomers. It is true that land values have increased from 100 to 500 per cent in the territory covered by the act since it took effect. It is true also that by passing the title of these public lands to individuals, together with the improvements made incidental to home building, the establishment of schools and churches, and the growth of towns and the increase of holdings of personal property and the consequent rise in values of land previously owned by individuals, the volume of taxable property of western Nebraska has been many times multiplied and enormously increased, thus reducing proportionately the rate of taxation of every property owner in the State.

Mr. Speaker, the direct and the indirect benefit to individuals, to the State, and to the Nation of the home building promoted

by the one-section homestead law for Nebraska are so manifold as to challenge an adequate portrayal, and I shall not go into details here about it.

Mr. Speaker, I have already shown that of the 11,000,000 acres made subject to the one-section act for Nebraska, less than 200,000 acres thereof now remain untaken. This of itself verifies the success and the wisdom of the law. With so little of public lands remaining in Nebraska, and that consisting wholly of separated or isolated tracts too small for an entry, the act can have but little effect in the State, even if the Secretary of the Interior should make it applicable, which he is authorized to do. Therefore, it is not for the direct benefit of my constituents that I am giving the bill my most hearty support, but for the benefit generally of the portions of the great West to which the act will be made applicable by orders issued from time to time by the Secretary of the Interior. I should also add the act might be made applicable to Nebraska, with material benefit with respect to the purchase by settlers of isolated small tracts at not exceeding $1.25 per acre. Under the present law these isolated tracts can not be sold at less than $1.25 per acre, but the purchaser is required to pay the highest price bid therefor at an auction sale and not less than the price appraised at by a special land office agent, which appraisement is often so very high as to make the purchase of the tract prohibitive. The Members from the public-land States in particular know that the statute itself does not authorize that an appraisement be made, but rules and regulations of the Department of the Interior do so require, but, in my judgment, as a rule such practice operates to the detriment of communities and to the injustice of the pioneer settlers. Whether or not the Secretary would order the act to be applied to any particular locality for the sole purpose just suggested, I am firmly convinced that a policy should be adopted for the disposition of isolated tracts which would be calculated to secure to the owners of adjoining lands a preference to purchase, and I think the Government would be sufficiently safe in selling to the highest bidder without requiring an appraisement to be made, and the price so fixed to constitute the minimum at which the tract may be sold.

The SPEAKER. The time of the gentleman from Nebraska has expired.

Torpedo Boats.

EXTENSION OF REMARKS

OF

HON. LEMUEL P. PADGETT,

OF TENNESSEE,

IN THE HOUSE OF REPRESENTATIVES,

Saturday, February 27, 1915.

Mr. PADGETT. Mr. Speaker, I desire to ask unanimous consent to extend my remarks in the RECORD by printing a letter from the Secretary of the Navy giving a detailed statement of the awarding of contracts with reference to torpedo boats.

The SPEAKER. Is there objection? [After a pause.] The Chair hears none.

The letter is as follows:

NAVY DEPARTMENT,
Washington, February 25, 1915.

DEAR MR. PADGETT: I should like to supplement my brief note of yesterday on the allegation that last December I awarded a destroyer contract to a Bath shipyard at $10,000 more than the bid of a Seattle shipyard by the full history of bids and awards for these destroyers.

I append hereto a statement showing all bids received in connection with the six destroyers concerned opened November 10, 1914. In addition to the bids from private contractors there were received estimates from the Mare Island Navy Yard, the lowest estimate for the construction of one destroyer being $626,487, and it being stated that the estimate for a second vessel would be from $25,000 to $34,000 less than for the first vessel.

These bids and estimates were referred to the Bureaus of Construction and Repair and Steam Engineering, which bureaus on December 2, 1914, submitted joint recommendation based upon the faces of the bids. The recommendation of the bureaus is summarized as follows:

One vessel to the navy yard, Mare Island	$626,487
One vessel to Fore River Shipbuilding Corporation	815,000
Two vessels to Wm. Cramp & Sons S. & E. B. Co. (each)	841,000
Two vessels to Bath Iron Works (each)	850,500

It will be observed that in spite of the great possible saving, amounting to about $200,000, the bureaus recommended that only one vessel be built at the Mare Island Navy Yard. In this connection the bureaus stated:

"It should be borne in mind, however, that neither the Mare Island yard nor any other United States navy yard has built a vessel of this class. While, therefore, the bureaus are inclined to recommend that destroyer construction be undertaken at the Mare Island yard, it is believed that it would be unwise to undertake more than one, as this class of work is in itself a specialty, and it is to be expected that unforeseen difficulties of various kinds will be encountered which will increase the cost of the first vessel beyond that of subsequent ones. The bureaus accordingly recommend that one of these vessels be built at the navy yard, Mare Island, in accordance with the estimate of $626,487."

It will be noted that the bureaus recommended the award of two vessels to the Bath Iron Works, although their bid was higher than that of Fore River and of Cramp & Sons. This recommendation was for the reason that the record of the Bath Iron Works in connection with destroyer construction was particularly good and superior to that of either of the other bidders. No mention was made in the bureaus' recommendations of the Seattle Construction & Dry Dock Co. or of the other two high bidders. The bid of the Seattle Construction & Dry Dock Co., as seen from the tabular statement herewith, was materially higher than the bids of Cramp and Fore River.

I gave very careful consideration to the bids received, consulting freely with the technical experts of the department, and came to the conclusion that all of the bids were unduly high. I have felt for some time that we were paying too much for destroyers, and largely for this reason arranged to have Mare Island investigate and submit estimates of the cost of building these vessels. The low estimate submitted by Mare Island went far to confirm me in my opinion that previous prices and the bids received for these destroyers were higher than they should be. Accordingly, I informed bidders that I regarded the prices named by them as too high and would give consideration only to lower figures. Some question having been raised as to the legality of this procedure, the matter was referred to the Solicitor of the Navy Department, who gave an opinion on December 17, 1914, that "* * * the Secretary was well within his legal authority in receiving from bidders on the destroyers for which the awards were now under consideration modifications of their prices."

After receiving the modifications referred to and consulting with representatives of the bidders the award of contracts was finally made as follows:

1 vessel to the navy yard, Mare Island, at	$626,487
2 vessels to the Fore River Shipbuilding Corporation, each (their original bid)	795,000
2 vessels to the Bath Iron Works, each	800,000
1 vessel to the Wm. Cramp & Sons S. & E. B. Co., at	812,309

It will be observed that the total cost of these six vessels, as thus awarded, is $4,628,796, as against $4,824,487, the award recommended by the bureaus on the face of the bids—a difference of nearly $200,000.

The awards as finally made were strictly in accordance with the lowest prices obtained, except that an award of one boat was made to the William Cramp & Sons Co. at a price of $812,309 (reduced from $853,000), while the Seattle Construction & Dry Dock Co. reduced its price for one boat from $873,000 to $810,000, a difference of $2,309 in their favor. Of course, the allegation that I gave a contract to a Maine shipyard at a price $10,000 greater than the price of the Seattle company is without foundation in fact, the contract price for the Bath boats being $10,000 less, not greater, than the lowest figure of the Seattle company.

As the Seattle Construction & Dry Dock Co. had never undertaken this class of work, and as its record in connection with previous work for the Navy Department did not entitle it to exceptional consideration, I did not believe it to the interests of the Navy for a saving of less than three-tenths of 1 per cent to award a contract to this company, with accompanying risk of delays and difficulties in its execution, practically inevitable in the case of inexperienced contractors. I assured the representatives of the company, however, that the department appreciated their desire to meet its views, and that I hoped to be able at some future date to award this company a contract for the construction of a destroyer.

I may add in this connection that my action in awarding this destroyer to the Cramp company instead of to the Seattle company was fully indorsed at the time by my technical advisers.

As you know, six destroyers were contracted for in 1912, the same number in 1913, and these last six in 1914. I append a table giving a comparison of the contract prices of these destroyers, from which it will be seen that the total cost of the 1914 destroyers, which are larger than their predecessors, will be $4,629,156, as compared with a total cost of $5,064,000 in 1912 and $5,157,000 in 1913. I regard this saving of something over half a million dollars—in the neighborhood of 10 per cent of the total cost of these vessels—as one of the most creditable things in connection with my administration of the Navy Department.

Sincerely, yours,

JOSEPHUS DANIELS.

Hon. LEMUEL P. PADGETT, M. C.,
Chairman Committee on Naval Affairs,
House of Representatives.

Table giving comparison of contract prices of destroyers of 1912, 1913, and 1914.

Curtis.

Outlook for Prosperity.

EXTENSION OF REMARKS
OF
HON. ANDERSON H. WALTERS,
OF PENNSYLVANIA,
IN THE HOUSE OF REPRESENTATIVES,

Monday, March 1, 1915.

Mr. WALTERS. Mr. Speaker, I desire to print in the RECORD an address by Mr. George W. Perkins, on the "Outlook for prosperity," delivered before the Economic Club of New York February 10, 1915. Mr. Perkins said:

"Something must be wrong when, in a country as marvelously rich as ours in agricultural and mineral resources, where the people are industrious and ambitious, it is necessary for the members of the Economic Club of New York to spend an evening discussing the outlook for prosperity. What is the trouble? Is it superficial or fundamental? For one, I believe it is fundamental; that it is a conflict between economics new and economics old—a conflict that has been raging in this country for 20 years or more.

"In recent years we have been given a myriad of inventions having to do with steam, electricity, and wireless, every one of which has made possible the expansion of man's energies and opportunities. At the same time we have been given a myriad of laws having as their one and only object the contraction of man's energies and opportunities. As a matter of fact, it is difficult to recall one single permissive or constructive law, either State or National, that has been passed in recent years. I do not know of a piece of recent national legislation that has had as its declared or underlying purpose the promotion of business and the protection of investor, laborer, and consumer, or that has been based on sound twentieth-century economics and morals. The inventor has been headed in one direction, the lawmaker in exactly the opposite direction. How can we expect prosperity under such conditions? A house divided against itself must fall, and our prosperity has fallen.

"In 1876 Messrs. Bell and Watson startled the world by announcing that they had talked to each other over a 2-mile wire while they themselves were in Cambridge and in Boston, respectively. Since then the telephone has been gradually perfected, until last week the same two men were able to talk to each other while they were in New York and San Francisco, respectively. In 1876, San Francisco was 3,400 miles from New York, and the only possible way then for a man in New York to talk to a man in San Francisco was by transporting his body from New York to San Francisco, which at that time took eight or nine days. Through the perfection of the telephone the 3,400 miles separating San Francisco from New York have been annihilated; and, for conversational purposes, business in San Francisco is now nearer to the New Yorker with a long-distance telephone than is his neighbor around the corner who has no telephone. We do not do business with our bodies, we do it with our minds; and the telephone has emancipated the mind from the body and given it wings, so to speak, which allow it to go hither and yon, doing business where it will, while the body remains in one place. San Francisco is no longer 3,400 miles from New York; it is only a few seconds from New York.

"This is but one of countless illustrations of the new economics against the old.

"While this miraculous economic transformation has been taking place almost all our political leaders and so-called statesmen have stood still, both in thought and in action; they have refused to budge an inch toward accepting the new conditions or toward changing their own views on economics, as they learned them when boys, from books that are now musty and obsolete. The result has been a great tug of war between our vast body of political leaders and our vast body of business leaders; first, because of the utter and complete lack of thought, study, and research on the part of our political leaders as to the new economic conditions under which we have suddenly found ourselves living; and, second, because our business men, confronted with these mighty economic changes, have been obliged to adjust themselves to the new economic conditions and yet try to comply with laws enacted to meet the old economic conditions.

"Did any man in this room ever hear of a political leader or so-called statesman delivering a speech in a State legislature or the National Congress calling the attention of the people to the mighty changes that have taken place in the methods of intercommunication during the last 20 years and pointing out that, as intercommunication is the first requisite for doing business,

these mighty changes are entirely responsible for the centralization of business?

"On the contrary, speech after speech has been made, haranguing our people with the grossly misleading statement that the trusts exist because of the tariff and the greed and avarice of a small group of men. A more pernicious and misleading statement has never been thrust on the attention of our people. No one would dare make it if our political leaders had their minds on the real problem rather than on vote getting; if they really studied big industrial questions from the viewpoint of the public good rather than their own good; if they had the courage and honesty to stand up for what is right and sound in law and business rather than for what is for the moment popular. The tariff never made a trust, and free trade never will destroy one. It requires only a little serious, intelligent thought to reach the inevitable conclusion that if we were given free trade in this country to-morrow not a single so-called trust would dissolve. On the other hand, even though our tariff were put as high as the mountains, if that strange force that we call electricity were suddenly withdrawn from our use, and the telephone and the telegraph went out of existence, not a single so-called trust could continue for 24 hours. In all the hours and years of debate on the question of corporations and big business I doubt if a single speech has ever been made calling attention to the great fundamental fact that a volcanic upheaval has taken place in methods of intercommunication; that the ox team, the stage coach, the sailing vessel, and the horse car have been buried deep in the ashes of the past and in their place have arisen steam, electricity, and the wireless. While this great change has come suddenly it has come so naturally that we have scarcely stopped to realize that it has shaken the very foundations of our economics, for with the disappearance of old methods of intercommunication has disappeared the old school of economics, and with the advent of new methods of intercommunication has arisen a new school of economics.

"In 1876, when Bell first used the telephone, our tariff was much higher than it is to-day, and yet there was not a single so-called trust or giant corporation in this country at that time. If you will trace the evolution of the trust from the day that Messrs. Bell and Watson talked over that first telephone line, in 1876, down through the last 40 years, you will find that centralization of all sorts—in society, in the growth of cities, in department stores, in methods of transportation, in giant office buildings, in corporations and trusts—has kept almost exact pace with the development of the telephone, of electricity generally, of steam, and the wireless. Yet while this progress has been going on, mighty and gigantic as it has been, our political leaders by speech and act have shown themselves to be entirely oblivious to what was happening. They have had the effrontery to stand up before our people and tell them that the centralization of business power has been largely due to our protective tariff and greedy, unscrupulous men, and that by legislation this centralization can be stopped, and we can be turned back to the methods under which our forefathers did business, when, as a matter of fact, there is only one law that could accomplish this, viz, a law that would make it a penal offense to use steam or electricity. You might as well attempt to change the course of the sun as to attempt through legislation to return us to the business conditions of our forefathers while permitting us to use steam and electricity. It is not the trusts that have made the times; it is the times that have made the trusts.

"When a man elected to one of the highest offices in the gift of our Nation makes a definite and public statement, and that statement is printed by our newspapers and carried to the people throughout the land, we must not blame the people for accepting it as the truth, especially when it goes unchallenged. To illustrate precisely what I mean, the President of the United States during the last few weeks has repeatedly assured the country that prosperity is knocking at our door because of the legislation the Democratic Party has enacted during the last two years; that the Government has no further quarrel with business; that business on a large scale is perfectly legitimate; that size is no crime; that business enterprises should be measured by the standard of conduct alone.

"While the President has been delivering these addresses the business world has been confronted with the following actualities: In the Government suit to dissolve the International Harvester Co. the United States District Court for the District of Minnesota handed down a decision a short time ago dissolving that company on the ground that it had acquired too large a percentage of the business in which it was engaged; yet all the judges who joined in the decision gave the company a clean bill of health as to its conduct, and even went so far as to criticize the Government for charging that the company had improperly conducted its business. The Harvester Co. has taken an appeal to the Supreme Court.

"Again, only three weeks ago, the United States District Court for the Eastern District of Pennsylvania—a court of precisely the same standing and power as the court that decided against the Harvester Co.—handed down a decision refusing to dissolve the Keystone Watch Case Co., specifically stating that, in its opinion, under the Sherman law, size is no crime; that the company had been guilty of a few improper practices, but that these could and should be reached by governmental injunction and not by governmental dissolution. The Attorney General has appealed this case to the Supreme Court.

"Here we have the President saying that size is no crime, and here we have the President's Attorney General at almost the same moment appealing to the Supreme Court to overrule the circuit court and decide that size is a crime. Here are two circuit courts of exactly the same rank and judicial power, second in authority only to the Supreme Court itself, handing down within a few weeks of each other decisions that are absolutely in conflict. Could there be confusion worse confounded?

"When our highest courts can not agree as to what the business laws of the country mean and permit, when the President talks one way and his Attorney General acts the other, how can a business man know on what basis he can do business? How can capital be expected to invest money in enterprises and do business and employ labor? What say you of the outlook for prosperity under such conflicting and impossible conditions?

"Now, you gentlemen who are listening to me this evening know that business has got to be done on facts, on acts, and not on theories and the personal opinions of individual men, no matter how important may be the governmental positions they temporarily hold. Eager and anxious as our great business world is to follow President Wilson in his assurance that all is well between the Government and business, that capital need no longer hesitate, and that business may forge ahead, it is utterly impossible for it to do so while actually existing conditions are as outlined above. The decisions in the Harvester and Keystone Watch cases proves beyond the shadow of a doubt that up to date no business man, no lawyer, no court has been able to find out definitely how business can be done legally, on a large scale, under the Sherman law.

"Prosperity that is permanent, that is fair to one and all, can not be had while all these contradictory conditions exist; and they exist largely because the business men of our country have been so obsessed with chasing the 'almighty dollar' that they have neglected their civic duties. They have allowed our politicians to talk any sort of 'hot air' doctrine to the people that would temporarily bring success at the polls, and they have not lifted a voice or raised a hand to point out to the people the absolute falsity of the doctrines that were being preached.

"While these things have been happening in our own country our greatest industrial competitor, Germany, has been pursuing exactly the opposite course. While our so-called statesmen have been haranguing our people on the subject of giant corporations being a menace to their liberty, to their business and physical welfare, and have been demanding that we return to the methods of ruthless competition and abandon the idea of cooperation, German statesmen have been preaching exactly the opposite doctrine to their people. For 25 years Germany and this country have been pursuing opposite economic policies. Our Sherman law was passed 25 years ago; and since that time, and particularly during the past 15 years, our politicians have thrived and grown fat in an effort to force our business men to do business under a literal interpretation of that law, which, our politicians have told us, means the breaking up of all large business units and the holding of our commercial relations to a strictly competitive basis.

"Twenty-five years ago Germany was the land of the small industrial unit, and her people were leaving the country every year in large numbers, seeking some other land where they hoped to find better industrial conditions. Then Germany gradually changed her system of economics. Her political leaders, her statesmen, with great foresight and after careful thought and study, realized that modern intercommunication must inevitably mean centralization, vast expansion in trading opportunities, vast responsibilities for the State, vast additional powers for the man of large mental endowment and of large means. In place of passing laws to repress and repel and prohibit all this, the Germans took exactly the opposite course and began to gather their industries together into large units, under the watchful eye of the Government or under the actual control of the Government in some form. Rapidly, and practically in unison with the mighty growth of intercommunication, Germany has forged ahead during the last 25 years, centralizing

her various industries, until now nearly every industry in Germany is organized and centralized in some form of large business unit. As a result, great commercial power and vast commercial profits have come to her people. And now, mark this well, while this centralization has been going on, emigration from Germany has fallen from what was a very large figure 25 years ago practically to zero during the last two or three years. Does not this rebuke the theories of our politicians and so-called statesmen? For the theory they have been preaching has been that if we permitted centralization and cooperation in business it would bring hardship and ruin to our people, while the actual carrying out of such a policy in Germany has resulted in the industrial prosperity and contentment of her people.

"Whatever may be said or thought regarding Germany's attitude in the present war, no thoughtful, studious man who has taken the pains to study Germany's commercial evolution during the last 25 years can for one moment doubt that her statesmen have been on the right industrial track; that they have been long-headed and farsighted; that they have cast off the economics of the past and taken on the economics of the future; that they have discarded old laws and old methods and enacted new laws and adopted new methods to keep abreast of the new age in which the world is moving and living; and that all this has been to the great material advantage of Germany's people as a whole.

"On the other hand, no thoughtful, studious man who has taken the pains to study our own commercial evolution during the last 25 years can for one moment doubt that our so-called statesmen have been on the wrong industrial track; that they have been shortsighted; have refused to cast off the economics of the past and take on the economics of the future; have refused to discard old laws and old methods and to enact new laws and adopt new methods to keep abreast of the new age in which the world of to-day is moving and living; and that all this has been to the material disadvantage of our people as a whole.

"Is it not high time that we called a halt; that we got our bearings both at home and abroad? Is it not just possible that Germany's industrial program is more in keeping with the twentieth century than is our own industrial program? If so, will she not outstrip us in the next quarter of a century in the race for commercial supremacy? Is it not just possible that our statesmen have been wrong in claiming that the commercial salvation of this country depends wholly on the enforcement of their interpretation of the Sherman law? Is it not just possible that, in place of repressive legislation, what has been and is needed is permissive legislation, with restrictions that will safeguard the people from the avarice of unscrupulous men?

"On many occasions I have publicly stated my views on this subject, strongly advocating publicity with Federal regulation of our great interstate and international industrial concerns. I have made known my own views upon the subject of the public policy that is required to enable the economic development of the United States to hold its own with that of Germany. The results of my reflection upon the problem may be summed up in two brief phrases: (1) Federal regulation of our great interstate and international industrial concerns; (2) complete publicity as to the affairs of these concerns. The latter is as important as the former, for both are needed to establish and maintain public confidence in the rectitude and public spirit of the conduct of our great business enterprises. The people must be satisfied that centralized power will not be abused in the future as it has been in the past. For while human nature may not be as selfish as of old, it is still selfish; and while we can and must discard old economics for new, it is not so easy to discard selfishness for unselfishness. I believe a solution of this problem must come largely through the setting up in this country of some other standard of reward than that of the 'almighty dollar'—some other mark of distinction than the number of millions a man is worth or leaves at his death. The yardstick of wealth, as the measure of a man's worth, must give way to the yardstick of service for service's sake. Our industrial system must be such that a man holding a high business position will be held in high esteem as a public servant, receiving two kinds of pay: His reward in money and his reward in honors—both in exchange for service rendered. Publicity, full and frank, would be potential in establishing such a system.

"The larger our industrial concerns and the greater the power of individuals, the more searching must be the measure of publicity required of them by law, and the stronger and more constant must be the limelight on their every action. For many years, both privately and publicly, I have strongly advocated and worked for the adoption of the principle of publicity in our business world; I have long been a firm believer in publicity as a cure-all for most industrial ills and as a safeguard for the public's interests. The law of publicity is about the only law governing the President of the United States, to whom the people give vast power. They can do this because everything he does, every move he makes, every word he utters, almost every change of his countenance is watched, recorded, and publicly interpreted. It would be impossible to have any code of laws, minutely defining the power of the President, that could possibly be as effective as the power of publicity which constantly regulates and controls him. What better precedent could we have for the regulation and control of our semipublic servants in our great industrial world?

"The responsibility for future prosperity is solely up to the sober, able business men of this country. They can no longer shirk this responsibility without disastrous results. They have been shirking it right and left, and they have only been saved up to date because of the unsurpassed resources of our land and the indomitable energy of our men. The limit has been reached, however, and we can no longer defy the new economic conditions and still hold our place in commerce, either at home or abroad. We can no longer leave the solution of this great problem to men of theories, men who talk much and think little, men who do not care for anything except their own political success, whose thoughts are limited in scope to the size of their election districts, who never had a world-wide view or opinion on any subject, men who continually deal in finely rounded but utterly meaningless phrases, in half truths, in evasions, and who are experts in the art of side stepping. If our public men insist on being superficial in thought, insincere and cowardly in action, then it is up to the business men, little and big, to see to it that such men are elected to stay at home, and that others are sent to our legislative bodies who will have broader vision and higher ideals.

"No greater evidence has ever been given of the intelligence of our people than that which is being given right now in the unmistakable change that is coming over their minds as to the methods under which business must be conducted in this country if prosperity is to be ours. For years our public speakers have filled the people full of a false doctrine, and very little, if anything, has been given to them on the other side of the question; yet, through their own intelligence, they have begun to see the light, and, I feel certain, are now ready to listen with impartial care to an educational campaign on this whole question.

"The people know that something is radically wrong. They are in a thoughtful mood, and this provides the best possible opportunity and occasion for an educational campaign to thrash out with the people the great difference between economics new and economics old. The time is as ripe for an educational campaign on this subject as it was for the campaign of gold against silver in 1896.

"Economics new in place of economics old will open up to our great country an era of prosperity—permanent general prosperity, the like of which we have never known—prosperity that will be ours in an abundance beyond the hopes and dreams of even the greatest optimist."

Oregon Railroad Land Grant.

EXTENSION OF REMARKS

OF

HON. A. W. LAFFERTY,

OF OREGON,

IN THE HOUSE OF REPRESENTATIVES,

Monday, March 1, 1915.

Mr. LAFFERTY. Mr. Speaker, last Friday I filed in the Supreme Court the following brief, which I print in the RECORD by way of extension of my remarks on the subject of the Oregon railroad land grant:

[In the Supreme Court of the United States, October term, 1914. No. 679. Oregon & California Railroad Co., Southern Pacific Co., Union Trust Co., and Stephen T. Gage, defendants and appellants; John L. Snyder et al., cross complainants and appellants, and William F. Slaughter et al., interveners and appellants, *v.* The United States of American, appellee. On certificate from and writ of certiorari to the United States Circuit Court of Appeals for the Ninth Circuit.]

SUGGESTIONS OF JOHN L. SNYDER ET AL. IN SUPPORT OF MOTION BY THE UNITED STATES TO ADVANCE CASE FOR EARLY ARGUMENT.

"May it please your honors, leave to file these suggestions within three days was granted in open court on February 23, 1915.

"Thirty copies hereof were filed with the clerk on February 26, 1915. On the same day service was made by mail upon all other counsel to the record, such service being made upon Mr. A. A. Hoehling, jr., of Washington, D. C., in behalf of the Oregon & California Railroad Co., the Southern Pacific Co., and Stephen T. Gage; upon Mr. John C. Spooner, of New York, in behalf of the Union Trust Co.; upon Mr. John W. Davis, Washington, D. C., Solicitor General, in behalf of the United States; and upon Mr. John Mills Day, of Tacoma, Wash., in behalf of the interveners.

"This litigation was started on September 16, 1907, by John L. Snyder, one of 65 cross complainants, whom I represent in this record. These cross complainants were then, and are now, actual settlers upon certain tracts of the land involved, as is shown by the record.

"It will be my endeavor to show to your honors that this case ought to be advanced for argument for April during the present term.

"The litigation has now been pending for nearly eight years. That in itself ought to be a strong reason for refusing now to delay the case practically another year by putting it over until October, as is desired by the railroad company. The cross complainants, who are the only settlers on the land, have at all times been diligent and have at all times urged reasonable speed in the case, but they have been held back and hampered by long and unreasonable delays, both by the railroad company and by the United States, as will be shown by the record.

"In May, 1914, nearly one year ago, the case was argued before the circuit court of appeals, and at the conclusion of the argument the court announced that, owing to the importance of an early final decision, it would immediately certify the case here. That course was taken to save time. Yet no time will be saved if the case now goes over until October, for the case would have reached here by October, 1915, if the court of appeals had gone ahead and decided it instead of certifying it. It was clearly understood at the time of the certification that the parties would all agree to a motion to have the entire record sent up, and that the case should come on for argument at the October, 1914, term. Counsel for the railroad at that time announced that they were anxious for a final decision here, and that they would join the Government in a motion to bring up the whole record and to advance the case, and such announcement on the part of the railroad was given to the press of the Pacific coast at the time and widely circulated. The public was given to understand that if any delay should occur in bringing the case to final issue here it would not be because of any lack of desire on the part of the railroad company for an early decision. Such an interview was given out by W. D. Fenton, leading counsel in the argument of the case for the railroad company, and was printed in the Portland Oregonian on June 5, 1914. The same is on file in the Congressional Library, and is hereby referred to and made a part hereof.

"In that interview Mr. Fenton said:

"We expect that the case, under the Federal practice, will be certified to the Supreme Court to be docketed at the October term, 1914, and that it will be regularly assigned for trial on motion to advance about March next. The statute provides that when the case reaches the Supreme Court on a certificate of the judges as to questions to be answered by the court that the Supreme Court may answer the questions or may make an order that the entire record shall be sent up.

"All parties, I believe, will join in a motion in the Supreme Court to have the entire record sent up, so that that court may try the questions involved, both law and fact, without the necessity of sending the case back to the circuit court of appeals with the answers to the questions to be certified.

"The case, I have no doubt, will be heard upon the merits and upon the entire record by the Supreme Court as early as I have indicated, certainly within the next 12 months. This long litigation will thereby be ended, very greatly to the satisfaction of everyone and to the interest of the public as well as the companies.

"The foregoing certainly shows that the railroad company has had ample notice to be ready for trial and that it is ready to present its case now.

"By the acts of April 10, 1869, and May 4, 1870, the Oregon & California Railroad Co. received in Oregon 3,100,000 acres of land to aid in building a railroad from Portland to the California line, but with a specific provision in each grant as follows:

"*Provided*, That the lands hereby granted shall be sold by said railroad company to actual settlers only, in quantities not greater than 160 acres to any one settler, and for prices not exceeding $2.50 per acre.

"The lands were to be patented to the company as fast as the road was built. The road was completed in 1887, but most of the patents were withheld till 1895 because not applied for by the company. So the lands have actually been patented to the company only about 20 years, and during the last 8 years the lands have been involved in this litigation. A few tracts have been sold and conveyed by the company since this litigation was started, no restraining order having been issued.

"Prior to the starting of this litigation the company had sold, contrary to law, 800,000 acres, and, therefore, had remaining 2,300,000 acres. Since this litigation was started Congress has confirmed the titles of all those who purchased prior to the beginning of this suit. Hence the 2,300,000 acres, or thereabouts, remaining unsold in the possession of the company and unaffected by the claims of any so-called innocent purchasers are the only lands now involved.

"The Oregon & California Railroad Co. is the original grantee of the Government. The Southern Pacific Co. gets into the case only because it owns the stock of the Oregon & California Co. Stephen T. Gage comes in only because he was a trustee in a mortgage given on the land at one time by the grantee company to secure the preferred stockholders. The Union Trust Co. is a defendant because it is trustee in a mortgage given on this land by the grantee company to secure the payment of bonds that were issued to get money to build the road. The defendants have all been named in this paragraph.

"Snyder and the 64 other actual settlers on the land are the original complainants, and it was these settlers who instituted the present litigation in 1907. I was their attorney at the time, and am still their attorney. One year later, September 4, 1908, as shown by the record, the United States intervened in the suits started by these settlers, and filed a bill in equity, asking that all the 2,300,000 acres of unsold lands here referred to be forfeited to the United States. After six years the district court for Oregon rendered a judgment of forfeiture. That was in 1913.

"As stated, no opinion was expressed in the court of appeals, and the case is now here.

"The only question involved is the very simple one of construing the meaning of the words:

"*Provided*, That the lands hereby granted shall be sold by said railroad company to actual settlers only, in quantities not greater than 160 acres to any one settler, and for prices not exceeding $2.50 per acre.

"The settlers on the land, whose suits are in the nature of test cases, claim that this language constitutes a trust which must be enforced by the court. The United States claims that it constitutes a 'condition subsequent,' for breach of which forfeiture is a proper remedy. And the railroad company claims that the language is so vague, indefinite, and uncertain as to be unenforceable, and, besides, that the settlers and the United States are barred by laches, and that the bills should all be dismissed for lack of equity. The Union Trust Co. claims that it is an innocent encumbrancer to secure the payment of $20,000,000 in bonds, and that no judgment should be rendered cutting off its security. These are the simple issues in the case, and no one should be concerned by the voluminous record which has been stuffed and padded with statutes, documents, and everything else that could be set out in the same.

"The 'interveners' are a class of people who have signified their willingness to settle upon the land and buy certain tracts from the railroad company, and who have tendered certain applications to purchase, but who do not claim to have been actual settlers at the time, and who, therefore, did not bring themselves within the terms of the statute, and clearly have no rights in the case.

"The prayer of the Government's bill of complaint is in the alternative. It asks, first, for a forfeiture; and, second, if forfeiture shall be denied, for the appointment of receivers to administer the grant and sell the lands out to actual settlers under such rules and regulations as will secure an orderly disposition of the same. Such rules would doubtless provide for a drawing system, for the lands are now very valuable. Less than 100 settlers are actually on the land, and none can go on hereafter without the permission of the court, as the trust estate is in the custody of the court. Therefore it would be a simple matter for the court to enforce the trust.

"The lands here involved would make 15,000 homes of 160 acres each, or 60,000 homes of 40 acres each. I am going to contend for the sale of the lands through receivers in tracts of 40 acres each, and through a drawing system, which would give all citizens an equal chance to get a home in this most favored of all sections of the United States. The law says the lands shall be sold to actual settlers only 'in tracts not exceeding 160 acres,' so that the court in administering the grant could very properly order the lands sold in tracts of 40 acres to each settler.

"The suggestions to be filed by the railroad through Mr. Hoehling in favor of putting this case over till October have not yet been served upon me, and I am, therefore, in poor position to anticipate and answer them. But I can say generally that all parties are as nearly ready now as they will ever be. This case was fully briefed a year ago in the court

of appeals upon the identical record now here. Very few changes, if any, will be made in those briefs when reprinted for filing here. They could be amended as desired, and refiled here within 15 days without the slightest inconvenience.

"It is very usual for railroad attorneys to urge business elsewhere as a ground for a continuance when they desire one, so I shall anticipate that argument. It is an argument that could as well be urged where the business is elsewhere pending, alleging that counsel would have to be present here. And I dare say that the railroad company has no business pending anywhere more important than this case. Counsel should get continuances elsewhere, if any continuances are necessary, and be on hand here to argue this case in April of this year.

"Conservatively the lands involved in this suit are worth $25 per acre, or $50,000,000. The settlers are not trying to 'get something for nothing,' because, in addition to the $2.50 per acre, and all taxes and disbursements, which they offer to pay to the railroad company, the settlers will have to make homes out of the land, and they will thereby give to the United States all the lands are worth. The establishment of happy and prosperous homes in this Switzerland of America was the real consideration that Congress contemplated should pass from the settler to the Government for the land. The giving of the $2.50 per acre to the railroad company was only incidental. The railroad company was made merely the sales agent of the Government. In the debates in Congress when the lands were granted Mr. Holman, of Indiana, objected to the bill and Mr. Sargent, of California, answered in this language:

"The gentleman, in his blind rage, does not distinguish between this grant and those which were unrestricted. He says the lands along the Union Pacific now sell for $10 per acre. Under the provisions of this bill the company can never realize more than $2.50 per acre for the land, even if the building of the road makes them worth $100 per acre."

"And in the Senate, upon the same bill, Mr. Williams, of Oregon, who had been Attorney General of the United States, said:

"These lands will be as open to settlers under the provisions of this bill as they are under the preemption laws of the country. Notwithstanding the grant of this aid to this railroad company, every foot of the lands granted must be sold by the company to actual settlers, and for prices not exceeding $2.50 per acre."

"This much of the record is cited in order to show to your honors the great responsibility that now rests upon this honorable court to enforce a bequest of a Congress of the last generation made for the benefit of the homeless of the present generation. This honorable court may wish to hold the case under advisement during the summer vacation, in order to reach, after mature thought, the best solution for carrying out this great trust. No one could object to that. But to put the case off for argument till October would, in my opinion, be without just cause.

"It is certain that the parties are not going to agree to an abbreviation of any part of the 17 volumes of the record in this case. It is certain that they are going to put on the court the burden of looking through the whole record. In fact, a proposition made by the Solicitor General to agree to an abbreviated record has already been refused by the railroad company. They simply agree that all parties shall point out in their briefs those portions of the record which they deem important. That very thing is already provided for by rule. That very thing was done in the briefs already prepared and filed in the court of appeals. Therefore no stipulation recently filed can afford any excuse for giving further time to prepare briefs.

"All parties have known for one year that this case would come on for hearing here this spring. All parties are, therefore, ready, or if any party is not ready it is his own fault, and it would be generous enough for this honorable court to give such party until April 5 to get ready.

"If this case goes over till October for argument, this honorable court will have but little time next fall and winter for anything else; but if the case shall be argued now members of the court may examine the record at leisure during the coming summer vacation, and be prepared to render a decision early next winter, or possibly sooner. The sooner the case is taken up the easier the task will be for all concerned. The longer it is put off the better will be the chance of the railroad to defeat justice, which it has striven craftily to do ever since the grant was made. The railroad is entitled to no further delay, but should meet the issue now. It has had eight years over the protest of the settlers on the land, who are responsible for this suit being here, and it should not be granted another year now.

"With greatest respect for this honorable court, I submit these suggestions with all the earnestness at my command.

"A. W. LAFFERTY,
"*Solicitor for Cross Complainants.*"

Mr. Speaker, on Monday, March 1, 1915, the Supreme Court sustained the foregoing brief, and set this land-grant case for argument for April 19, 1915.

This was a great victory for the settlers on the land, because both the Government and the railroad company wanted the case put over till October, 1915, for argument. The case will now be finally argued and finally submitted in April, and will be finally decided probably as early as October, 1915.

I shall do all within my power to secure a decree for enforcement of the terms of the grant and for the sale of these lands to settlers under the drawing system.

If the lands should be forfeited to the Government, then Congress should pass an act opening them up to homestead settlers under a drawing system. In other words, the intention of the original granting acts that these lands should go to settlers ought to be carried out.

These will probably be my last remarks in this House during my present service. Under the law I am charged with the duty of distributing the books, maps, and bulletins due my district between March 4, 1915, and the time when Congress shall again convene. Anyone desiring any such documents who will apply by letter, telephone, or in person at my office, 736 Pittock Block, Portland, Oreg., will be supplied.

The City of Hartford, Conn.

EXTENSION OF REMARKS

OF

HON. AUGUSTINE LONERGAN,

OF CONNECTICUT,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, March 2, 1915.

Mr. LONERGAN. Mr. Speaker, the city of Hartford, for which H. R. 18310 aims to acquire a site for a public building, is one of New England's busiest industrial centers. An indication of its remarkable growth is found in the upward tendency of the postal receipts of the city. In 10 years the receipts have doubled, and for the year ending June 30, 1913, the receipts were six times what they were in 1880. In 1880 the receipts were $104,000; in 1913 they were $660,026.51.

Hartford had one particular advantage in its early history. It began right. When the Rev. Thomas Hooker and his party came there to establish a permanent settlement, in June, 1636, they exercised wise forethought in dealing with the Indians. Instead of separating the red men from their lands by force, they acquired the lands by purchase. Consequently they were welcomed by the river Indians, the band which occupied Suckiang, the Indian name for Hartford. Although Edmund Andros was wont to say, "A title acquired of the Indians is no better than the scratch of a bear's paw," the title acquired by the Hooker party was a just title, and the grantors thereafter regarded the white men as their allies. Having commenced right, Hartford has continued on the right course ever since, and the best testimony of its rewards is found in the progress and prosperity of its institutions.

The population of Hartford is now close to 120,000, and it is estimated that the increase since 1900 is 41,000. The city is located on the New York, New Haven & Hartford Railroad line, midway between New York and Boston, and has the benefit of over 150 passenger trains daily. The growth of this thriving city is guaranteed by the important and diversified manufacturing, insurance, and commercial interests. Known the country over as "the home of insurance companies," the word "Hartford" is the synonym for strength and honor when applied to these organizations. It is a well-known fact that at the time of the great earthquake and conflagration on the Pacific coast the real sufferers were San Francisco and Hartford—San Francisco because of its property losses and Hartford because of its insurance losses. Although almost staggered by the millions upon millions of dollars which they found themselves called upon to pay, every Hartford insurance company met its burden squarely, paying dollar for dollar on every claim; and, in addition to this, no city in the United States responded more generously than Hartford in voluntary contributions for the relief of the earthquake sufferers.

Hartford's banking institutions, like its insurance companies, are modern in methods and equipment, efficient in service, and are excelled by none in the country. It is a noteworthy fact that the Hartford banks have $1,000,000 worth of assets to every 1,000 inhabitants, and its insurance companies $1,000,000

assets to each 250 inhabitants. Its National and State banks and trust companies have combined capital of $6,965,000; its savings banks have deposits of over $51,000,000.

Mr. Speaker, the manufacturing district of the city is a cause for pride on the part of every Hartford citizen. This district, representing millions of capital, is one of the cleanest in the world; a tour among the various plants discloses well-designed and well-lighted buildings, many of them vine covered and surrounded by spacious, well-kept lawns. Their products include typewriters, guns, pistols, machine tools, horseshoe nails, automobiles, automobile and bicycle tires, steel balls, screws, electrical apparatus, marine engines, machinery of all kinds, and countless other articles of utility in the industrial field.

PARKS, LIBRARIES, AND SCHOOLS.

Over 1,000 acres of parks, 700 of which are city owned, contribute to the pleasure and well-being of Hartford's citizens, providing playgrounds for the children, baseball diamonds, golf links, tennis courts, and bowling greens for the grown-ups—all extending a perpetual invitation and welcome to the whole people to come out more into the open to enjoy nature's richest landscape beauties and to breathe God's own fresh air.

The Hartford Public Library has over 90,000 volumes, and is as capably conducted as any library in the country. Its reading and reference rooms are veritable mines of information. The Connecticut Historical Library has 25,000 volumes. Adjoining the public library is the Morgan memorial, the gift of the late J. Pierpont Morgan, once a native of Hartford, in memory of his father, the late Junius Spencer Morgan. This handsome structure contains many priceless art treasures.

Hartford has 18 public schools, 5 parochial schools, 4 seminaries, and 1 college. These institutions have established their reputation for efficiency.

Hartford is fortunate in its suburbs. It has been estimated that the city's population is 120,000 and the population of the city's suburbs 120,000 more. Steam train and trolley service are playing their part in bringing the communities together. An important movement in this direction is the farm-to-table parcel post extension which was inaugurated recently. Under this plan, the growers of produce in the suburbs are placed in communication with the consumers in the city; arrangements are made for disposing of the farm products and the delivery of the goods follows by parcel post. Mutual advantages result from the position of Hartford with relation to the manufacturing and agricultural districts.

H. R. 4388 provides for the erection of a public building at Manchester, a community which is one of Hartford's near neighbors. Not only do we look for favorable action on the bill for the Hartford Federal building site at the next session of Congress, but we also expect favorable action on the Manchester bill at that time. Manchester is a rapidly growing manufacturing community located within easy reach of Hartford, with a population of close to 16,000. The great Cheney silk industry, known all over the United States, is located in that town, furnishing employment to 4,000 hands. There are several other important interests in the town. Paved streets, fine schools, prosperous people, and attractive, well-kept homes owned by the workers, have earned for this community the title, "Manchester, the model manufacturing town of New England."

While the city of Hartford has many institutions which are sources of pride, the best asset of the city is the spirit of progress which dominates its people. No matter what movement is instituted, if it has a praiseworthy object in view, there will be no lack of support and that public spirit which has made Hartford one of the leading cities of the East is sure to assert itself in the interest of every worthy project.

Rural Credits.

EXTENSION OF REMARKS
OF
HON. JAMES A. FREAR,
OF WISCONSIN,
IN THE HOUSE OF REPRESENTATIVES,
Tuesday, March 2, 1915.

Mr. FREAR. Mr. Speaker, no rural-credit bill has been considered by this Congress until three or four days ago, when the Senator from North Dakota [Mr. MCCUMBER] succeeded in attaching his bill as a rider to the Agricultural bill. That bill is now before us. Rural-credit legislation has been sidetracked during the present session. The gentleman from Arkansas [Mr. WINGO] declares that in a Democratic caucus held on the currency bill over a year ago he was promised early legislation on the subject, but it is not until the closing days of Congress that, through accident, we are permitted to consider this important measure.

The House committee desires to now substitute the denatured Hollis bill in place of the McCumber bill, which has passed the Senate, and the friends of rural credits have tried to-day to strengthen the Hollis bill. Of a dozen bills offered to-day, some of which cover over 100 pages, I believe the Bathrick bill is the best, because it provides workable machinery and genuine Government aid; but that bill has been defeated by this committee.

We have been advised by the gentleman from Alabama [Mr. HEFLIN] that the President will probably veto any measure that affords actual financial aid by the Government—a remarkable statement—and in these closing hours of Congress we are compelled to choose from a dozen bills that have been presented.

I shall not waste words in further presenting a situation which condemns itself.

Neither the McCumber bill nor the Hollis bill, in my judgment, are free from defects, but this seems to be the only chance of securing legislation on farm credits, and all defects can be corrected by proper legislation as soon as they become manifest. I am not willing to vote for the denatured Hollis bill that proposes an expensive machinery and maintains a corps of high-priced officials in order that farmers may borrow from other farmers or borrow from themselves. Farmers will never avail themselves of a law that only resolves itself in a mass of words used to authorize cooperation, but which does not carry any form of Government aid as is proposed by the Bulkley amendment or the McCumber bill. I believe either of these two latter measures can be made workable, and one or the other should be passed by the House.

Gentlemen have told me that in States in which they live interest rates, commissions, and discounts, all employed to evade usury laws, compel farmers in those States to pay from 10 to 20 per cent annually on borrowed money secured by farm mortgages. I am informed by the gentleman from Ohio [Mr. BATHRICK], an acknowledged authority, that farm-loan interest rates in my own State are exceptionally low, and that in southern Wisconsin the average interest rates are lower than in any other part of the country.

The McCumber bill provides for a 5 per cent interest rate, and the amended Hollis bill for a rate not to exceed 6 per cent. To this rate must be added abstract charges, title opinion, and other expenses, so that the farmers of my own State will not be materially benefited by the passage of either bill. I believe, however, these bills if framed into law and carefully administered would reduce excessive farm-loan rates in many other States. If we can aid farming interests anywhere in the country, if we can lessen the burdens borne by those who replenish the Nation's storehouse in peace and in war, if we can make farm life more attractive by a fairer adjustment of conditions, every man should do his share.

Those who toil on the farm will be doubtful of professions of friendship or concern if Congress passes a rural-credit bill that is a sham. Just as the farmer finds cold comfort in a tariff law that places his own products on the free list in competition with the world but compels him to buy from those given tariff protection.

He knows full well that while this Government is pouring from eight to ten millions annually into the Mississippi River in a futile, wasteful effort to reclaim lands for private speculators he, the farmer, and nine hundred and ninety-nine disinterested citizens out of every thousand pay the bills without any resulting benefit.

He knows that while efforts are being secretly and openly pushed to have Congress appropriate $19,000,000 for a private water power company in Alabama—we beat it this year—that one-quarter of that amount will finance a rural-credit system as proposed by the Bathrick bill. Without one cent of aid from the Treasury other than an advance loan of $5,000,000 this can be done, because the bonds or debentures based upon mortgages received would furnish a revolving fund for continuing the work.

The farmer knows that if $8,200,000 is thrown into the Ohio River wild canalization scheme this year, as the river and harbor bill proposes, that about half of that amount, which will be largely wasted, would serve to start the preliminary investment under the Bathrick bill provisions.

Mr. Speaker, only day before yesterday the Treasury statement showed $62,488,677 of Government money on deposit in national banks of the country, and that money is being loaned to the banks at 2 per cent. How can we defend this practice and yet refuse rural-credit aid?

Notwithstanding a direct income tax and a brand new war tax is in effect, the general fund is now down to $42,636,000,

according to that same statement, the lowest point reached in many years. On the heels of this net balance of $42,000,000 the farmer and every other citizen will know within a day or so that a compromise river and harbor bill of $30,000,000 is likely to come over to us from the Senate, carrying over one-half of that extravagant amount for wasteful rivers and worthless creeks.

I will not favor any credit bill that would tend to unsettle legitimate business conditions in any locality, nor a bill that is not hedged about by careful provisions. In the study afforded in the Bathrick or McCumber bills as amended I believe they are not subject to either criticism. It is unlikely that any rural-credits bill that loans money at 5 or 6 per cent, with other loan expenses, will be of much service to the farmers of my own State, but I do believe we should do what we can to fairly adjust individual burdens so far as we may properly do so, and make our Government what it was originally intended to be—a means of raising standards of social conditions and material prosperity to all its citizens.

It has been said that this year's Agricultural bill carries an unprecedented sum of $27,000,000, in round numbers; that $2,154,535 is for plant industry; $2,747,976 for animal industry; $2,500,000 for preventing the foot-and-mouth disease; and a large item of $8,553,256 is for the Forestry Service. I have also heard it suggested upon this floor that the House has passed a highway bill giving Government aid to farmers.

Admitting the increase in appropriations, no intelligent man will have the effrontery to say that the appropriation is all for the farmers of the country. Is not the public equally interested in stamping out disease, whether among men or animals? Is not disease, in the final analysis, an economic loss that is borne by the public, whether through appropriations for health boards or to prevent injury to the public welfare? Is the farmer any more interested than other citizens in eight and a half millions given to forestry? To credit such appropriations to agriculture is to unload on that industry what may with equal reason be charged to any other business.

But if the whole $27,000,000 were for agriculture, we must not forget that over $33,000,000 in cash was saved from the iniquitous river and harbor bill last year—more than enough to cover the entire agricultural appropriation for 1915. Although several millions more have been stricken from this year's river and harbor bill, an amount will be sent over from the Senate to-day, according to report, that will exceed the entire 1915 Agricultural bill—for what? Can any sane man question the prodigious waste exposed in that bill?

Highways are for the use of the general public as much as for farmers; so the suggestion that Government aid for highways is a favor extended to the producers of the country alone becomes farcical. It is worse than farcical; it is pure buncombe; because while a cotton-loan bill and a ship-purchase bill have been kept before the Senate for weeks and months during the Sixty-third Congress, the party in power, that without difficulty passed the Underwood law, the currency law, and other administration bills, has done nothing with the highway bill. That has been smothered somewhere around the Senate committee having it in charge. The rural credits bill would also be sleeping but for Senator McCUMBER's bill which he has placed before us. Is it not significant that the last national Democratic platform declared for rural credits and national highway aid?

The great majority of our people are directly or indirectly interested in both highways and rural credits, whereas only a comparatively small section of the country is affected by the cotton-loan bill or the temporary ship-purchase bill as proposed.

All these last-named proposals have received solemn, deliberate, exhaustive, and exhausting attention from the party in power that controls legislation in Congress. Weeks and months for a cotton-loan bill and ship-purchase bill, one day for a rural-credits bill, and not a minute to Government aid for highways. Why?

Would it not have been better public policy to meet the self-evident needs of the country instead of bending every effort to care for sectional or special interests?

Mr. Speaker, I shall vote for the rural-credits bill before us, notwithstanding it is not all that could be desired. It is, in my judgment, something that, properly handled, may furnish this country with needed credit organizations as efficient and helpful as the Landschaften of Germany, the Bavarian agricultural bank, the Hungarian land-mortgage institute, the Canton banks of Switzerland, or the land-credit banks of France. We are behind other countries in this respect, and our Government owes a duty not to agricultural interests alone, but to itself, for whatever is just and whatever benefits the farmer, either directly or indirectly, benefits all.

Memorial to John Fitch.

EXTENSION OF REMARKS
OF
HON. J. HAMPTON MOORE,
OF PENNSYLVANIA,
IN THE HOUSE OF REPRESENTATIVES,
Tuesday, March 2, 1915.

Mr. MOORE. Mr. Speaker, because of its great value as a historical document, I have asked the privilege of extending my remarks by inserting in the CONGRESSIONAL RECORD an address made to the Committee on the Library by Mrs. Ben Johnson, of Kentucky, in support of a movement inaugurated by the John Fitch Chapter of the Daughters of the American Revolution to secure a suitable memorial to mark the last resting place of John Fitch, at Bardstown, Ky. The House having granted this request, it is only fair to say that this brilliant piece of research work by the wife of our own distinguished colleague from Kentucky [Mr. JOHNSON] will be found worthy of the national interest which its publication in the RECORD evokes.

In a spirit of fairness to the memory of Robert Fulton which is most commendable, Mrs. Johnson presents such facts as to the life and work of John Fitch, with details culled from original documents, as to leave no room for doubt as to the usefulness and priority of the services of John Fitch in applying steam to the purposes of navigation. The records have been searched and the facts with respect to Fitch's endeavors have been faithfully scanned by the painstaking Kentucky biographer who has undertaken to attain for Fitch his rightful place in history. Mrs. Johnson carries the story from the birth of Fitch, in South Windsor, Conn., in 1743, on through his experiences as mechanic, surveyor, and inventor, until he started his first steamboat on the Delaware River in 1787 from Philadelphia to Burlington, N. J., and then to his last resting place where the Daughters of the American Revolution stand guard over his remains at Bardstown, Ky., where he died in July, 1798.

I shall not further trespass upon the excellent paper which Mrs. Johnson has prepared, except to say that with many Pennsylvanians I concur in her happy thought, that John Fitch's memory should be commemorated by the National Government to which he gave the benefit of his great achievement with that personal inconvenience and sacrifice which is so often characteristic of men of genius.

It was my good fortune to have given some study years ago to the work of John Fitch, incident to the celebration in August, 1887, of the one hundredth anniversary of the expedition made by Fitch in his second boat, launched from Philadelphia and paddled up to Burlington under the power of a small steam engine. Having joined in that celebration, which covered the entire route of the original Fitch expedition, I can appreciate the importance and the propriety of the research work which Mrs. Johnson has made a labor of love.

STATEMENT OF MRS. BEN JOHNSON.

I append herewith the statement of Mrs. Ben Johnson, delivered before the Committee on the Library February 27, 1915:

MEMORIAL TO JOHN FITCH.

Mrs. JOHNSON. Mr. Chairman and gentlemen of the committee, I appear before you to-day to urge a favorable report upon House bill No. 19393. This bill has for its purpose the erection of a suitable memorial to John Fitch.

In having this bill introduced and in appearing before you to urge a favorable report upon it, it is neither my purpose nor desire to reopen the question as to who first applied steam to navigation. However, I hope to convince you before I conclude that John Fitch was such a pioneer in this respect that our National Congress will not hesitate to mark the grave where his remains lie buried.

In discussing his inventive genius it will become necessary for me to give the dates when he applied steam to navigation. I wish to impress that if those dates are prior to the time that any other persons attempted to apply steam to navigation they are not used with the view of in anywise lessening the honor attaching to another for whatever part he may have taken in the development of this great work, but solely for the purpose of having Fitch recognized by the Nation as he should be.

Some years ago a chapter of the Daughters of the American Revolution was organized at Bardstown, Ky., at which place I reside. The ladies who undertook that patriotic work did me the honor of making me the organizing regent.

John Fitch, the subject of my remarks to-day, was a Revolutionary soldier. This is one of the reasons that local chapter of the Daughters of the American Revolution has been named the John Fitch Chapter.

In the old Municipal Cemetery at that place rest his remains.

As I said in the beginning, the purpose which I have in view in addressing you is to secure a suitable marking for his grave.

The credit of first applying steam to navigation is generally given to Robert Fulton. I concede at once that Fulton's steamboat, the *Clermont*, was the first to navigate the River Hudson. It is also true that Fulton, with the aid of Robert R. Livingston, materially developed the steamboat. Much credit should also be given to Oliver Evans, Nicholas I. Roosevelt, Samuel Morey, John Cox Stevens, and a few others. History correctly records that the *Clermont* made its initial trip from the city of New York to the city of Albany, N. Y., in August, 1807. No claim whatever of an earlier invention has been made in Fulton's behalf.

The elastic force and the propelling power of steam had been known for several centuries before the birth of either Fulton or Fitch or the others who undertook its application to navigation. It is highly probable, indeed, that men of inventive minds, recognizing this power in steam, conceived the idea that eventually it would be applied to water navigation, just as in more recent years, long before aerial navigation became an actuality, its coming was predicted in all civilized countries.

Since I am here urging a favorable report for this bill upon the ground that Fitch, at a very early date, applied steam to navigation, I shall now proceed to give you dates and facts justifying the position which I take relative to him.

John Fitch was born in South Windsor, Conn., on January 21, 1743. During his early life he exhibited a marked talent for mechanics. Early in life he qualified himself as a practical surveyor, and a large portion of his life was devoted to surveying in what was then termed the Northwest—the country west of the Allegheny Mountains, including the States of Ohio and Kentucky. He was an active man, mentally and physically, and was gifted with wonderful perseverance. He died at Bardstown, Ky., in July, 1798.

It is a self-evident fact, therefore, that whatever his achievements were, they must have been prior to August, 1807, at which time Fulton made his trial trip with the *Clermont* on the Hudson.

In the early part of 1785 John Fitch resided in Bucks County, Pa. On April 15 of that year he expressed his conception of the idea of applying steam to water navigation. Prior to that time he had considered the possibility of propelling carriages by steam, but later abandoned this idea because of the then lack of good roads, an insurmountable obstacle.

On April 15, 1785, as he was returning from Neshaminy meeting to his home, the idea of the steamboat occurred to him.

In the document division of the Congressional Library, Washington, D. C., there are many interesting originals and authenticated copies of letters, certificates, documents, and miscellaneous papers relative to the first steamboat. Most of the proofs to which I shall invite your attention have been taken from this collection. The authenticity of others to which I shall refer can be easily established.

From the collection in the Congressional Library I have taken the two following statements:

I do certify that as I was returning with John Fitch from Neshaminy meeting some time in April, 1785, as near as I can recollect the time, when a gentleman and his wife passed by us in a riding chaise. He immediately grew inattentive to what I said. Some time after that he informed me that at that instant the first idea of a steamboat struck his mind.

JAMES OGILBEE.

—

You are desirous of knowing from me when the first thought of a steamboat came in your head; this I can not tell, but this you told me, that in the month of April, 1785, you was traveling down Street road in company with Mr. James Ogilbee, and Mr. Sinton passing you on Street road, then the first thought occurred to you of a steamboat, and in the month of May or June following you showed me a plan of your machine on paper. This truth I shall seek no further testimony to support; 'tis too generally known; let them that doubt it come and hear more from

Your humble servant,

JAMES SCOUT.

APRIL 15, 1789.

Fitch states in his autobiography that the idea of the steamboat occurred to him about the time mentioned by these two witnesses. Shortly thereafter Fitch began the construction of a model, and later his first steamboat.

At that time there were in this country no facilities for constructing steam engines. Therefore Fitch was forced to rely upon very crude materials and workmanship. He called to his assistance a blacksmith of the neighborhood, and in Cobe Stout's log shop he made his first steamboat.

Of the model of that boat Dr. William Wood, of East Windsor Hill, Conn., said:

The model was tried on a small stream on Joseph Longstreth's meadow, about half a mile from Davisville, in Southampton Township, and it realized every expectation. The machinery was made of brass, with the expection of the paddle wheels, which were made of wood.

On file in the Congressional Library is an original bill against John Fitch in favor of Jacob Schieffel. It bears date July 20, 1785, and shows that it was paid by Fitch July 25, 1786. One item of this bill is "for bar iron and cols. for steam ingin."

In August, 1785, Fitch decided to ask the assistance of the Continental Congress, which was then in session in the city of New York. Before doing so, however, he obtained letters of commendation from men prominent at that time.

Dr. John Ewing, then provost of the University of Pennsylvania, gave him a commendatory letter to William C. Houston, who had been a Member of Congress. Fitch presented this letter to Mr. Houston, who, after examining Fitch's steamboat model, gave him a similar letter to Hon. L. Cadwalader, a then Member of Congress. Dr. Samuel Smith, provost of Princeton College, also gave him a letter to Congressman Read of North Carolina.

Upon arriving in New York Fitch presented these letters. He also presented to the president of Congress his own petition, wherein he asked for the encouragement of his invention by Congress. These letters and the petition are now to be found among the documents in the Congressional Library, and read as follows:

PHILADELPHIA, *August 20, 1785.*

DEAR SIR: I have examined Mr. Fitche's machine for rowing a boat, by the alternate operation of steam and the atmosphere, and am of opinion that his principles are proper, and philosophical, and have no doubt of the success of the scheme if executed by a skillful workman. It is certain that the extensive force of water when converted into steam, is equal to any obstruction that can be laid in its way, so as to burst any metallic vessel in which we would endeavor to confine it, and the application of this force to turn a wheel in the water so as to answer the purpose of oars seems easy and natural by the machine which he proposes, and of which he has shown me a rough model. Should such a machine be brought into common use in the inland navigation through the United States, it would be exceedingly advantageous in transporting the productions of America to market, and thereby greatly increase the value of our back lands. He proposes to lay his invention before Congress, and I hope he will meet with the encouragement which his mechanical genius deserves. The project deserves a trial to be made of it, to see how far the execution will answer the theory; and countenance of Congress in these productions of genius, will encourage others and thereby give birth to discoveries that may be infinitely beneficial. As you are a gentleman of knowledge in these matters I make no doubt of his receiving your patronage so far at least as to give him an opportunity of laying his scheme before Congress.

I am, sir, etc.,

JOHN EWING.

—

TRENTON, *August 25, 1785.*

SIR: I have examined the principles and construction of Mr. Fitche's steamboat, and though not troubled with a penchant ior projects, can not help approving the simplicity of the plan. The greatest objections to most pretensions of this sort is the delicacy and complication of the machinery. This does not seem liable to such objections. As to the moving force of the whole, we know very well that the power of steam is beyond conception; it is everything but omnipotent, and almost that.

The model is plain, and you will at once form a judgment of its probable general effect. The difference produced by standing or running water is to be more attentively considered. I inclose you Dr. Ewing's letter. He is certainly an able judge in these cases, and I can not help expressing a wish that it may be practicable to do something toward procuring an experiment. The person who offers it, you know. He is a man highly deserving, as modest, ingenius, enterprising, and of good morals.

I am, sir, etc.,

WILLM. C. HOUSTON.

Hon. L. CADWALDER, Esq.

—

PRINCETON, *August 27, 1785.*

SIR: The bearer, Mr. John Fitch, has shown me a model of an instrument to row a boat against streams, which appears to me to be constructed on just and philosophical principles. As he desires to propose it to Congress in order to obtain their encouragement and assistance to construct a boat on the same principles, he has requested to be introduced to some gentlemen of distinction in the honorable body, supposing it may be of use to forward his intentions. After convincing them of its practicability and utility, if he should obtain adequate assistance for that purpose, he makes no doubt that Congress will so recommend him to the legislators of particular States that are likely to derive the most benefit from it, so that he shall not want a proper compensation. You will best judge about this. But I am assured that if it be consistent with their duty a scheme that is the effect of ingenuity and application and promises to be of public service will not want a proper patron in you.

I am, sir, etc.,

SAML. SMITH.

Hon. Mr. READ.

—

AUGUST 29, 1785.

SIR: The subscriber begs to lay at the feet of Congress an attempt he had made to facilitate the internal navigation of the United States, adapted especially to the waters of the Mississippi. The machine he had invented for the purpose has been examined by several gentlemen of learning and ingenuity, who have given it their approbation. Being thus encouraged, he is desirous to solicit the attention of Congress to a rough model of it now with him, that after examination into the principles upon which it operates they may be enabled to judge whether it deserves encouragement. And he, as in duty bound, shall ever pray.

JOHN FITCH.

The committee to which the matter was referred did not report thereon. This failure of action is not unlike that which usually has been accorded to men of inventive genius when seeking financial assistance from public sources.

Seeking encouragement elsewhere, Fitch then proceeded to Philadelphia. On September 27, 1785, he presented to the Philosophical Society of that city a model and specifications of his invention.

Attention is especially invited to the fact that in all of these papers it affirmatively appears that Fitch's idea was accepted as entirely new, and that it contemplated the use of steam to propel vessels.

What action was taken by the Philosophical Society of Philadelphia does not appear, but the records of that society furnish abundant evidence of Fitch's invention. In the Congressional Library there is an excerpt from the minutes of the society, attested by one of the secretaries, which reads as follows:

September 27, 1785. Philadelphia. At a special meeting of the American Philosophical Society.

A model, accompanied with a drawing and description of a machine for working a boat against the stream by means of a steam engine, was laid before the society by Mr. John Fitch.

—

At a meeting of the American Philosophical Society on December 2, 1785.

A copy of the drawing and description of a machine for working a boat against the current which some time ago was laid before the society by Mr. John Fitch he this evening presented to them.

Extract from the minutes.

SAM MAGAW,
One of the Secretaries.

Prior to this time Fitch had made a map of the northwest country, and he hoped that Congress would assist him in the building of his boat by encouraging the sale of his maps. On August 30, 1785, he presented to the committee to whom his original petition had been referred the following communication:

To the honorable, the COMMITTEE OF CONGRESS:

It is with the greatest diffidence, though with the advice of several gentlemen of science, I have at last presumed to lay at your feet an attempt to assist the inland navigation of the United States, and particularly calculated for the waters of the Mississippi, by a steam engine.

JOHN FITCH.

NEW YORK, *the 30th August, 1785.*

With this communication, Fitch sent a rough drawing of the plan of his steamboat, which he described in detail.

He asked Congress to assist him in selling 4,000 maps, in consideration of which he stipulated that he would construct a steamboat at his own expense. Failing in his efforts to obtain assistance, either from Congress or from private individuals of means, he continued his efforts to obtain the necessary funds by the sale of his maps.

On November 15, 1785, he obtained from the soldier and statesman, Patrick Henry, the following certificate respecting his intention, if a sufficient number of maps could be sold. I will read the certificate:

I certify that John Fitch has left in my hands a bond payable to the governor, for the time being, for £350, conditioned for executing his steamboat, when he received subscriptions for 1,000 of his maps, at a French crown each.

P. HENRY.

On December 20, 1785, Fitch had printed and posted in Philadelphia, the following advertisement, a copy of which is in the Congressional Library:

To the encouragers of useful arts:

The subscriber humbly begs leave to inform the public that he has proposed a machine for the improvement of navigation, with other useful arts; that it has been honored with the approbation of many men of the first characters for philosophical and mechanical knowledge in each of the Middle States; that he has laid it before the honorable Assembly of Pennsylvania, now sitting, whose committee have been pleased to make a very favorable report on the subject. The result has been that a number of gentlemen of character and influence have undertaken to promote a subscription for his map of the northwest parts of the United States, in order to enable him to make a full experiment of his machine. He flatters himself the subscribers will think the maps well worth the money, yet he pledges himself to employ one-half of the money so contributed in constructing and bringing to perfection a machine that promises to be of infinite advantage to the United States.

JOHN FITCH.

N. B.—The following opinion was given to said Fitch, and subscribed by a number of gentlemen whose names would do honor to any projection in philosophy or mechanism.

"Upon considering the extent of the principles on which Mr. Fitch proposes to construct his steamboat and the quantity of motion that may be produced by the elastic force of steam, we are of opinion that if the execution could by any means be made to answer the theory when reduced to practice, it might be beneficial to the public, and it seems to be deserving of a fair experiment, which alone can justify the expectation of success.

"December 20, 1785."

In further prosecution of his efforts to interest those in authority, on November 25, 1785, Fitch visited ex-Gov. Johnson, of Maryland, and obtained from him a letter addressed to Gov. Smallwood, of Maryland, which letter I will now read:

FREDERICKTOWN, *November 25, 1785.*

SIR: Mr. John Fitch, of Bucks County, in Pennsylvania, called on me on his way to Richmond. He has gone through a variety of scenes in the back country, which has enabled him to collect a knowledge of a great part of the new States, on which and other helps he has made a map useful and entertaining. His ingenuity in this way strongly recommends him, but his genius is not confined to this alone. He has spent much thought on an improvement of the steam engine by which to gain a first power applicable to a variety of uses, amongst others to force vessels forward in any kind of water. If this engine can be simplified, constructed, and made to work at small expense there is no doubt but it will be very useful in most great works and, amongst them, in shipbuilding.

Mr. Fitch wants to raise money to make an experiment on boats. The countenance he has met with in Virginia he hopes will enable him to do it. He wishes also to make other experiments and is willing to enter into engagements to apply a large proportion of the sales of his maps his principal fund. I believe his proposition for this improvement will be ample security for his applying the money in that way. All that I have to request of you, sir, is that you will give him an opportunity to converse with you. You will soon perceive he is a man of real genius and modesty. Your countenancing him will follow, of course.

I am, sir, your excellency, most obedient and most humble servant,

THOMAS JOHNSON.

During the summer of 1785 Fitch succeeded in constructing a small steamboat which was successfully operated. In 1786 he began the construction of a second steamboat, which was not completed until 1787.

Dr. William Wood thus describes this latter boat:

This boat was 45 feet long and 12 feet beam. It had six oars or paddles on each side. The engine was a 12-inch cylinder.

While this boat was being constructed Fitch undertook to protect his invention by asking the Federal Congress to grant him a patent "for some reasonable time."

On March 15, 1786, he addressed the following petition to Congress:

To the honorable the United States in Congress assembled:

The representation and petition of John Fitch humbly sheweth that your petitioner having constructed an easy and expeditious method of urging boats through the water by the proper application of the force of steam, whereby the inland navigation of the United States of America is likely to be greatly promoted the principles whereof has been honored with the approbation of gentlemen of the first character for philosophical knowledge in several of these States who have expressed their desires of seeing it carried into execution by an experiment. And as it has been a general practice to encourage new invention and useful improvements by allowing their first projectors the advantages of their discoveries for some reasonable time wherefore your petitioner humbly prays that your honors will be pleased to grant him the exclusive privilege of constructing boats impelled by the force of steam and the advantages arising from that discovery on all waters now belonging to the United States, particularly on the Ohio and Mississippi Rivers, for such length of time as your honors may judge proper.

And your petitioner, etc.

JOHN FITCH.

TRENTON, *March 15, 1786.*

Congress took no immediate action on this petition.

In the early part of 1786 Fitch organized a company to construct steamboats of his design and otherwise to promote his invention. All of the records of this company are not now available, but it does appear that on August 2, 1786, the company acceded to Fitch's request that an assessment be levied upon each of the shareholders for the purpose of providing additional funds with which to finance the company.

In the Congressional Library is a letter written by Fitch to John Cox on August 2, 1786, which sets out the action taken by the shareholders on the preceding day. This paper reads as follows:

WORTHY SIR: The company met last evening to determine what further should be done concerning the steamboat, when there were eight present, to whom I made the inclosed proposals, and on considering the matter unanimously came to the following resolution:

At a meeting of several of the company's proprietors of the steamboat held the 2d day of August, 1786, agreeable to general notice given, the new proposals of John Fitch for an enlargement of his plan by further advances of money being now laid before us and considered of. It is agreed that the said plan be carried into effect upon a larger scale than was at first proposed, and that the further advances be $30 per share more than specified in on articles of agreement dated April 19, 1786. I could wish, sir, to be made acquainted with your determinations on the matter, and also Mr. Stevens's, as soon as may be convenient. I pray you, sir, also to communicate this to Mr. Stacy Potts, as I have not time to write him on the action at present, and request him to write to me whether he agrees to the proposal or not, and could wish it might be soon, as the money must be shortly raised for the purpose to have the boat a running in 10 weeks. With the most perfect respect, sir, I beg leave to subscribe myself,

Your ever faithful and very humble servant,

JOHN FITCH.

JOHN COX, Esq.

Fitch's second boat was completed in 1787 and was launched at once upon the Delaware River at Philadelphia.

At that time the Federal Constitutional Convention was in session in the city of Philadelphia, and the members of that convention witnessed the success of Fitch's steamboat.

Fitch himself said that practically all members of the convention were present on that occasion. That they were well pleased

with the trial is attested by the fact that letters of congratulation were given to Fitch by some of the prominent gentlemen who were present. Among those who gave letters to Fitch were Gov. Randolph and Dr. Johnson, of Virginia, David Rittenhouse, Dr. John Ewing, and Prof. Andrew Ellicott, of Pennsylvania. Chief Justice Ellsworth, of Connecticut, who was on board Fitch's steamboat upon that occasion, also said the experiment was a success.

This trial trip of Fitch's boat was made on August 22, 1787. Please bear in mind that it was not until August, 1807—exactly 20 years later—that Fulton launched the *Clermont* on the Hudson River.

The testimonials just referred to were given in December following August 22, 1787, several of which are now on file in the Congressional Library. The following letters, which I will now read, are indicative of the unqualified success of the trial trip made by the Fitch boat on August 22, 1787.

The first is from David Rittenhouse, and reads as follows:

These may certify that the subscriber has frequently seen Mr. Fitch's steamboat, which with great labor and perseverance he has at length completed, and has likewise been on board when the boat was worked against both wind and tide with a very considerable degree of velocity by the force of steam only. Mr. Fitch's merit in constructing a good steam engine and applying it to so useful a purpose will no doubt meet with the encouragement he so justly deserves from the generosity of his countrymen, especially those who wish to promote every improvement of the useful arts in America.

DAVID RITTENHOUSE.

At the bottom of the letter which I have just read is the following statement signed by John Ewing, which I will read:

Having also seen the boat urged by the force of steam and having been on board of it when in motion, I concur in the above opinion of Mr. Fitch's merits.

JOHN EWING.

PHILADELPHIA, *December 12, 1787.*

I will now read a letter signed by Mr. Andrew Ellicott:

From the well-known force of steam I was one of the first of those who encouraged Mr. Fitch to reduce his theory of a steamboat to practice, in which he has succeeded far beyond our expectations. I am now fully of opinion that steamboats may be made to answer valuable purposes in facilitating the internal navigation of the United States and that Mr. Fitch has great merit in applying a steam engine to so valuable a purpose and entitled to every encouragement from his country and countrymen.

ANDREW ELLICOTT.

PHILADELPHIA, *December 13, 1787.*

While the success of Fitch's invention was now assured, he was not satisfied with the speed which his boat attained on this occasion. After much labor and many vexatious delays he succeeded in obtaining the necessary funds with which to construct another steamboat.

This boat was 60 feet long with a beam of 12 feet. The trial trip of this boat was made during the latter part of July, 1788. Of this boat Dr. William Thornton, a prominent man of that time and who subsequently prepared the designs of the present Capitol Building at Washington, wrote:

Our boat will be tried this evening or to-morrow. Ours is moved by paddles placed at the stern, moved by a small steam engine.

The initial trip of this boat was from Philadelphia to Burlington, a distance of 20 miles—the greatest distance that had ever been traversed by a steamboat. Of this trip Dr. William Wood writes:

At every town along the river banks they were greeted with cheers and waiving of handkerchiefs, and when within a few rods of their destination, the pipe boiler sprang a leak and they came to anchor. The boiler was soon repaired and the boat made several trips to Burlington and back without any accident. On the 12th of October, 1788, there were 30 passengers on board, and these were taken from Philadelphia to Burlington (20 miles upstream) in 3 hours and 10 minutes, which fact was certified to by Andrew Ellicott, Richard Chase, John Poor, and John Ely.

The certificate to which Dr. Wood refers does not appear among the papers in the Congressional Library. However, there is in this collection the certificate of four passengers (two of whom are mentioned by Dr. Wood), which fully sustains Dr. Wood's statement.

I will read this certificate:

We, the subscribers, were passengers in Mr. John Fitch's steamboat from the city of Philadelphia to the city of Burlington, a distance of about 20 miles, which was performed in 3 hours and 10 minutes, with the tide, which gets in at the rate of 2 miles per hour.

There were upward of 30 passengers on board the boat, which was propelled by the force of steam, without any manual labor except that of tending the steam engine.

ANDW. ELLICOTT.
JOSEPH ELLICOTT.
BENJN. ELLICOTT.
RICHARD CHASE.

Although this trial was in every respect a success, Fitch, with his overpowering desire for improvement, determined to construct still another boat with larger machinery. The new design contemplated that the cylinder should be 18 inches instead of 12 inches in diameter.

The trial trip of this new boat was made on April 16, 1790—nearly 17 years before Fulton's trial with the *Clermont* on the Hudson River.

Fitch, in writing of the trial made on April 16, 1790, said:

Although the wind blew very fresh at the northeast, we reigned Lord High Admirals of the Delaware, and no boat in the river could hold its way with us; all fell astern, although several sail boats, which were very light, and heavy sails that brought their gunnales well down to the water, came out to try us.

During the summer of 1790 Fitch made a number of trips up and down the Delaware River with this boat. Those trips were so successful that Fitch, in writing of them, said:

Thus has been effected by little Johnny Fitch and Harry Voight one of the greatest and most useful arts that has ever been introduced into the world; and although the world and my country does not thank me for it, yet it gives me heartfelt satisfaction.

At this point I wish to say that some of Fitch's writings upon this subject are in the Congressional Library, while others are filed with the Historical Society in Philadelphia.

The success attained by Fitch's steamboat was so pronounced that during the summer of 1790 it was operated as a regular boat between Philadelphia and Burlington; and there regularly appeared in the two Philadelphia papers—the Pennsylvania Packet and the Federal Gazette—notices of the days and hours of sailing.

In the old National Museum at Washington can be found a copy of the Federal Gazette of July 27, 1790, in which appears the following advertisement:

The Steam Boat sets out to-morrow morning at 10 o'clock from Arch Street Ferry in order to take passengers for Burlington, Bristol, Bordentown, and Trenton, and return next day.

The advertisement which appeared in the Pennsylvania Packet of June 12, 1790, reads as follows:

The steamboat is now ready to take passengers, and is intended to set off from Arch Street ferry in Philadelphia, every Monday, Wednesday, and Friday, for Burlington, Bristol, Bordentown, and Trenton, and to return on Tuesday, Thursday, and Saturday.

These two newspaper advertisements are conclusive proof of the success of Fitch's invention and appeared 17 years before Fulton launched the *Clermont* on the Hudson.

From an inventive standpoint no historian claims that the slightest credit is due anyone other than Fitch for the steamboat that plied between Philadelphia and Burlington during the summer of 1790. That boat was propelled solely by the power of steam and carried passengers on regular, schedule trips.

According to modern standards it might have been of crude and rough design; nevertheless it and the date must stand in history as a practical exposition and demonstration of an invention that has revolutionized water navigation throughout the civilized world.

Those who have written of this boat say that it attained a speed of 8 miles an hour in ascending the Delaware, which was a higher rate of speed than was obtained by Fulton's *Clermont* 17 years later.

Elated with the success of the boat just referred to, Fitch designed and with the financial aid of his company constructed still a larger boat, which he very appropriately named *Perseverance.* It was intended that this boat should navigate the Ohio and Mississippi Rivers. In this hope, however, Fitch was disappointed, for about the time it was completed it was blown by a violent storm upon Pettys Island, in the Delaware, opposite the city of Philadelphia, and seriously damaged. Fitch's stockholders then became discouraged and declined to advance other funds. Fitch's own resources being exhausted, the boat was abandoned. For four years it remained upon Pettys Island, and was finally offered for sale at public auction on August 18, 1795.

In 1796, while residing in the city of New York, Fitch constructed another steamboat. Successful experiments were made with this boat on the old Collect Pond, on the site of which the present Tombs Prison now stands. There is abundant testimony relative to the construction and the success of this small steamer, but I do not deem it necessary to prolong my address by any extended reference thereto.

It is worthy of note, however, that this boat was driven by a screw propeller, and was unquestionably the first boat of this kind ever constructed.

Next, I desire to refer to what may be termed legislative proof of the dates of Fitch's invention.

On March 18, 1786, the Legislature of New Jersey passed a law granting Fitch—

the sole and exclusive right of constructing, making, using, and employing or navigating all and every species or kinds of boats or water craft which might be urged or impelled by the force of fire or steam in all the creeks, rivers, etc., within the territory or jurisdiction of this State for a period of 14 years.

On February 3, 1787, the Legislature of Delaware gave Fitch similar rights within that State. The State of New York, by its legislature, did the same thing on March 19, 1787. Pennsylvania gave such exclusive rights to Fitch on March 28, 1787, and similar action was taken by the Legislature of Virginia on November 7, 1787.

On November 16, 1787, James Rumsey presented to the House of Representatives of Virginia a petition in which he sought the repeal of the prior exclusive grant to Fitch on the ground that he was the inventor of a boat propelled by steam. This petition was referred to a committee, which reported a bill repealing the exclusive grant to Fitch. On November 26, 1788, this bill was defeated in the Virginia House of Representatives, which is very strong evidence not only of Fitch's invention, but also of its priority over Rumsey's; but if Fitch's invention antedated that of Rumsey it certainly antedated that of Fulton, which did not come until 19 years after the action of the Virginia House of Representatives.

The records of the Virginia Legislature show that on November 17, 1790, John Fitch filed a petition for an extension of his exclusive privilege to use the waters of the State for steamboat navigation on the ground that, while his boat had been completed, it had been injured by a storm. This boat was the *Perseverance*, to which reference has been made. The committee to which this petition was referred made a report thereon on December 7, 1790. I will read a copy of the record on this subject:

Mr. Henry Lee reported, from the Committee of Propositions and Grievances, that the committee had according to order, had under their consideration the petition of John Fitch, to them referred, and had come to a resolution thereupon, which he read in his place, and afterwards delivered it at the Clerk's table, when the same was again twice read, and agreed to by the House, as followeth:

"*Resolved*, That it is the opinion of this committee that the further consideration of the petition of the said John Fitch, praying that the time allowed him by law to complete and navigate a steamboat in this State may be extended one year from the 7th day of November, 1790, be deferred to the 31st day of March next."

While Fitch was thus obtaining exclusive rights of navigation from the States, he also undertook to procure other assistance from the legislatures of other States.

On January 5, 1786, he addressed the following memorial to the General Assembly of Maryland:

To the honorable the General Assembly of the State of Maryland:

The subscriber humbly begs leave to inform this honorable legislature that he has proposed a machine for promoting navigation which has been approved by the honorable assemblies of Virginia and Pennsylvania, and by many men of science who have examined the same and certified their approbation. A number of gentlemen of character and influence in the different States have undertaken to promote a subscription for his map of the northwest parts of the United States in order to enable him to make an experiment of said machine. He flatters himself by that means he might in time be enabled to do it, but as the means of procuring it is so dilatory and he proposes to send to Europe for a steam engine to effect it. He prays this honorable legislature to lend a sum sufficient for that purpose, and empower Andrew Ellicott, Esq., under whose patronage he wishes to erect it, to draw out of the treasury a sufficient sum to procure said engine, and the subscriber will refund the same to the treasury of this State out of the first subscriptions he shall obtain, or give sufficient security if he should take it out of the State. Should this honorable legislature see fit to appoint a committee to examine into the principles of said machine your petitioner as in duty bound will ever pray.

JOHN FITCH.

Fitch sent along with this letter the supporting statements, which I will now read:

Upon considering the extent of the principles on which John Fitch proposes to construct his steamboat, and the quantity of motion that may be produced by the elastic force of steam, we are of opinion that if the execution could by any means be made to answer the theory, when reduced to practice, it may be beneficial to the public, and it seems to be deserving of a fair experiment which alone can justify the expectations of success.

JOHN EWING.	RICHARD WELLS.
ANDREW ELLICOTT.	WM. LIVINGSTON.
R. PATTERSON.	EDWARD DUFFIELD.
FRANCIS HOPKINSON.	JOHN NANCARROW.

Fitch's request was referred to a committee, of which William Pinkney was chairman; and, on January 9, 1786, that committee made the following report to the general assembly:

The committee appointed to consider the petition of John Fitch beg leave to report—

That they have endeavored to obtain an adequate idea of the machine mentioned in the said petition and, from the great quantity of motion that may be produced by the elastic force of steam, the committee are strongly inclined to believe the probability of the success promised by the theory. Your committee beg leave to observe that the state and condition of our finances is such that no advance of public money can be made to assist the petitioner in bringing his theory to experiment, however desirable it may be to a liberal and enlightened legislature to encourage works of genius and promote the useful arts.

All of which is submitted to the honorable House.

By order,

WM. PINKNEY, *Chairman.*

JANUARY 9, 1786.

An authenticated copy of Fitch's petition to the General Assembly of Pennsylvania asking for exclusive rights of steam navigation in that State is among the documents relative to this subject in the Congressional Library. It bears date March 10, 1786, and, with the accompanying supporting statements, reads as follows:

MARCH THE 10TH, 1786.

To the honorable the representatives of the free men of the State of Pennsylvania in general assembly met:

The petition and representation of John Fitch humbly sheweth that your petitioner some time ago contrived an easy and practicable method of applying the force of steam to the urging of boats forward in our rivers whereby the inland navigation of the United States may be greatly promoted, which he has explained to gentlemen of science and mechanical abilities in several of the States, who have approved of the principles and wish to see the scheme carried into execution. That your petitioner has laid the scheme before the assemblies of Virginia and Maryland and has entered into obligations with the former of these for completing the work, and now apprehensive that others, from some trifling alterations which they may propose in the mechanism may deprive him of the benefit of his own invention and thereby frustrate his just expectations and encouragements, he prays that your honorable house would be pleased to grant him an exclusive privilege of constructing boats for a limited time upon the principles of working them by the force of steam.

And your petitioner, as in duty bound, shall ever pray.

JOHN FITCH.

We, the subscribers, have been acquainted with the principles and some of us examined the mechanism of Mr. John Fitch's steamboat, and are of opinion that it may be the means of improving the inland navigation of the United States.

We doubt not, therefore, that the inventor will find, as he appears to merit, the protection and encouragement of the legislature.

Bucks County, March 18, 1786.

(Signed)	HENRY WYNKOOP.	JOHN THORNTON.
	ANDREW MCMINN.	JOHN EDWARDS.
	GARDUS WINKOOP.	JACOB SOMMER.

Upon that petition the general assembly passed the act of March 28, 1787, to which I have heretofore made reference.

On April 23, 1791, Fitch applied to the Federal Congress for a patent of his invention. This patent was granted on August 26, 1791, the original document being signed by George Washington, and by Commissioners Thomas Jefferson, Gen. Henry Knox, and John Randolph. I invite your attention to the date of Fitch's patent—August 26, 1791—which was 16 years before Fulton sailed the *Clermont* on the Hudson.

I will read a copy of the record of the action taken by Congress upon this subject:

August 26, 1791, whereupon ordered that letters patent be granted to the said John Fitch for his aforesaid invention for the term of 14 years.

Unfortunately, the records of the General Patent Office were destroyed by fire on September 24, 1877. However, there was saved and is now in print a bound volume, giving a list of patents granted between 1790 and 1836. On page 5 of that publication it appears that on August 26, 1791, John Fitch was granted a patent "for propelling boats, etc., by steam, etc."

This book also shows that no earlier patent was granted to anyone for a similar invention.

On November 20, 1791, the French Government also granted letters patent to Fitch which protected his invention in that country for 15 years.

The original of this French patent is now in the old National Museum in Washington.

The application for this patent was made by Aaron Vail, an American consul in France, as attorney in fact for John Fitch.

Omitting the preamble, the recitation of the application, and the description of the invention, the following is a translation of the material clauses of this patent:

We have, according to the aforesaid law of the 7th of January, 1791, conferred and by these presents signed by our hands we grant to Mr. John Fitch an invention patent for the construction, exercise, and use throughout the kingdom for the time and space of 15 consecutive years from the date of these presents of a mechanism which moves boats, ships, and other vessels by means of a fire machine, by the means consigned in the note and the drawing below, and on the which note shall be placed a stamp or seal with the words "invention patent" and the name of the inventors, for him and his attorney in fact to use said patent throughout the kingdom during the time mentioned above, all in conformity with the order of the law of the 7th of January.

We must positively forbid any person to imitate or counterfeit the said machine under any pretext whatsoever. We desire to insure the said Mr. Fitch the use of his patent; that this be made a proclamation in our name which no one can ignore.

We command and order all tribunals, administrative bodies, and municipalities to grant fully and peaceably the use of the rights conferred by these presents upon Mr. Fitch and his attorney in fact, and to cease and make to stop all contrary troubles and hindrances. We command them also that at the first requisition of the patent they copy the presents on their registers, read, publish, and advertise them in their respective jurisdictions and departments during their duration as the law of the Kingdom.

In faith of which we have signed and made to be countersigned the said presents, to which we have affixed the State seal.

Paris, the 29th day of the month of November, 1791, and the sixteenth year of our reign.

LOUIS.

By the King.

The minister of the interior,
P. C. CAHIER.

As I said in the beginning, I desire in so far as it is possible to avoid raising any issue as to priority between Fitch and anybody else. But since Thurston, in the life of Robert Fulton, does not himself claim priority for Fulton, I trust I may be pardoned for here calling attention to what Thurston says.

On page 1 of Thurston's life of Robert Fulton the following appears:

Robert Fulton has often, if not generally, been assumed to have been the inventor of the steamboat, as Watt is generally supposed to have been the inventor of the steam engine, which constitutes its motive apparatus. But this notion is quite incorrect * * *. But while Fulton was not the inventor of the steamboat, and while James Watt was not the inventor of the steam engine, in a proper sense, it is the unquestionable fact that the latter was the first to secure a general introduction of the machine into practical use; and the former was the first to make the steamboat a commercial success, and to make its ultimate and permanent employment for marine transportation sure. As an inventor Fulton accomplished far less than Watt; in fact, he did comparatively little in this realm of intellect. Watt invented many improvements of the steam engine, and left it in vastly better form than when he found it, as it came from the hands of his predecessors, Newcomen and Calley. He gave the already well-shaped machine the separate condenser, the steam-jacket, the double-acting form, the rotative type, the expansive system, the governor, and the "engineer's stethoscope," the indicator. Fulton did nothing to modify the engine, or to improve the steamboat even. He simply took the products of the genius of other mechanics, and set them at work, in combination, and then applied the already known steamboat, in his more satisfactorily proportioned form, to a variety of useful purposes and with final success.

On page 34, in speaking of John Fitch and William Henry, of Chester County, Pa., Thurston says that while Henry was probably not the first to conceive the idea of the steamboat, "Fitch evidently made the first successful experiment in the propelling of boats by steam."

I shall be glad to here read what Thurston, in his life of Fulton, says regarding Fitch and his invention. I read from pages 36 to 39, inclusive:

John Fitch was an ingenious Connecticut mechanic. In April, 1785, as Fitch himself states, at Neshamony, Bucks County, Pa., he conceived the idea that a carriage might be driven by steam. After considering the subject a few days his attention was led to the plan of using steam to propel vessels, and from that time to the day of his death he was a persistent advocate of the introduction of the steamboat. At this time, Fitch says, "I did not know that there was a steam engine on the earth"; and he was somewhat disappointed when his friend the Rev. Mr. Irwin, of Neshamony, showed him a sketch of one in "Martin's Philosophy."

Fitch's first model was at once built, and was soon after tried on a small stream near Davisville. The machinery was made of brass, and the boat was impelled by paddle wheels. His own account of his invention is as follows:

PHILADELPHIA, *December 8, 1786.*

To the EDITOR OF THE COLUMBIAN MAGAZINE.

SIR: The reason of my so long deferring to give you a description of the steamboat has been in some measure owing to the complication of the works, and an apprehension that a number of drafts would be necessary in order to show the powers of the machine as clearly as you would wish. But as I have not been able to hand you herewith such drafts, I can only give you the general principles. It is in several parts, similar to the late improved steam engines in Europe, though there are some alterations. Our cylinder is to be horizontal, and the steam to work with equal force at each end. The mode by which we obtain what I take the liberty of terming a vacuum is, we believe, entirely new, as is also the method of letting the water into it and throwing it off against the atmosphere without any friction. It is expected that the engine, which is a 12-inch cylinder, will move with a clear force of eleven or twelve hundredweight after the frictions are deducted; this force is to act against a wheel of 18 inches diameter. The piston is to move 3 feet, and each vibration of the piston gives the axis about 40 evolutions. Each revolution of the axis moves 12 oars or paddles, 5½ feet, which work perpendicularly, and which are represented by the stroke of the paddle of a canoe. As 6 of the paddles are raised from the water 6 more are entered, and the two sets of paddles make their strokes about 11 feet in each evolution. The cranks of the axis act upon the paddles about one-third of their length from the lever end, on which part of the oar the whole force of the axis is applied. Our engine is placed in the boat about one-third from the stern, and both the action and the reaction turn the wheel the same way.

With the most perfect respect, sir, I beg leave to subscribe myself,

Your very humble servant,

JOHN FITCH.

Another of Fitch's boats, in April, 1790, made 7 miles an hour. Fitch, writing of this boat, says that "on the 16th of April we got our work completed and tried our boat again; and although the wind blew very fresh at the east, we reigned lord high admirals of the Delaware, and no boat on the river could hold way with us." In June of that year it was placed as a passenger boat on a line from Philadelphia to Burlington, Bristol, Bordentown, and Trenton, occasionally leaving that route to take excursions to Wilmington and Chester. During this period the boat probably ran between 2,000 and 3,000 miles, and with no serious accident. During the winter 1790–91 Fitch commenced another steamboat, the *Perseverance,* and gave considerable time to the prosecution of his claim for a patent from the United States. The boat was never completed, although he received his patent, after a long and spirited contest with other claimants, on the 26th of August, 1791, and Fitch lost all hope of success. He went to France in 1793, hoping to obtain the privilege of building steam vessels there, but was again disappointed, and worked his passage home in the following year, and later brought out a new boat in New York City driven by a screw propeller. It seems to have been customary to secure a witness in those days as in our own, and we have the following:

"This may certify that the subscriber has frequently seen Mr. Fitch's (John Fitch) steamboat, which with great labor and perseverance he has at length completed, and has likewise been on board when the boat was worked, against both wind and tide with considerable velocity, by the force of steam only. Mr. Fitch's merits in constructing a good steam engine and applying it to so useful a purpose will no doubt meet with the encouragement he so richly deserves from the generosity of his countrymen, especially those who wish to promote every improvement of the useful arts in America.

"(Signed) DAVID RITTENHOUSE.

"PHILADELPHIA, *December 12, 1787.*"

I shall be glad to here read a part of a letter written by Fulton to Lord Stanhope in November, 1793:

In June, 1793, I began the experiments on the steamships. My first design was to imitate the spring in the tail of a salmon. For this purpose I supposed a large bow to be wound up by the steam engine and the collected force attached to the end of a paddle, as in No. 1, let off, would urge the vessel forward.

In the old National Museum at Washington models of the steamboats of Fitch and Fulton, as well as a model of a boat designed by James Rumsey, are exhibited. On the glass cases in which these models are contained are explanatory labels. The dates, as well as other facts, stated on these labels fully sustain the claims I am making.

These labels are as follows:

JOHN FITCH'S STEAMBOAT.

Designed by John Fitch, built in Philadelphia in 1786, and first tested on the Delaware River July 27 of that year, when a successful public trial was made. Length, 34 feet; width, 8 feet; depth, 3 feet 6 inches. Equipped with a steam engine which, connected by geared machinery, sprocket whcel and chain, operated six oars placed vertically in a frame on each side of the boat.

In 1788 Fitch completed his first commercial boat for carrying passengers, and it was driven in a similar manner. This boat was 60 feet long and 8 feet wide. She made a trip from Philadelphia to Burlington, about 20 miles, in July, 1788, the longest ever made by any steamboat up to that date. October 12, 1788, the boat took 30 passengers from Philadelphia to Burlington in 3 hours and 10 minutes, a speed of over 6 miles an hour. In 1790 Fitch built another boat, which attained a speed of 8 miles an hour, and continued to run on the Delaware River, carrying passengers and freight, for three or four months.

—

RUMSEY'S STEAMBOAT.

Propelled by jets of water forced out through the stern. Tested on the Potomac River at Shepherdstown, Va., 1787.

—

STEAMBOAT "CLERMONT," 1807.

Designed by Robert Fulton, built in the city of New York, and made its first trip from that city to Albany in August, 1807. Length, 175 feet; breadth, 12 feet; depth, 8 feet. Equipped with a single-acting bell-crank engine, 24-inch cylinder, and 4 feet stroke; made by Boulton & Watt in England, which operated the side wheels, 15 feet in diameter. The hull was built with flat bottom, sharp vertical ends, perpendicular sides being straight on top, open in the middle, and having small cabins at the bow and stern. This model represents the first experimental boat designed and constructed by Robert Fulton. After making several successful trips it was replaced in the winter of 1807–8, by another boat also called the *Clermont,* which embodied numerous improvements made by Fulton.

In 1817 the question of priority between Fitch and Fulton was submitted to the General Assembly of New York.

On this subject Dr. William Wood says:

In 1817 the original patents, drafts, specifications, and models of Fitch and Fulton were exhibited before a committee of the New York Legislature, raised upon the petition of Gov. Ogden, of New Jersey. Witnesses were examined and able counsel employed. Fulton and Livingston were represented by Cadwalader D. Colden and Thomas Addis Emmet; Fitch's interests by Samuel A. Southard, Joseph Hopkinson, and Col. Ogden. Certificates of Dr. Rittenhouse, Andrew Ellicott, Oliver Evans, and John Ewing were produced, stating the performance of Fitch's steamboat. Gen. Bloomfield testified that he had been a passenger on board Fitch's boat on the Delaware in 1787 and 1788, and regarded the experiment as successful.

The committee having charge of this matter, after careful consideration, reported to the general assembly as follows:

The steamboats built by Livingston and Fulton were, in substance, the invention patented to John Fitch in 1791, and Fitch, during the term of his patent, had the exclusive right to use the same in the United States.

I wish to invite your attention to the fact that this finding was made by a body of men who resided in the State where Fulton's steamboat was built and where it was a matter of State pride.

In 1887 the Connecticut Legislature appointed a committee to investigate the matter of "the discoveries and inventions of John Fitch, of Windsor." The report of that committee was submitted to the general assembly in April, 1887, and was approved by the house of representatives on April 28, 1887, and by the senate on May 10, 1887. That report is very illuminating of the question under discussion, and reads as follows:

To the honorable, the Senate and House of Representatives of the State of Connecticut, in General Assembly convened.

The undersigned, appointed a special committee by joint resolution, beg leave to report as follows:

That in accordance with the instructions of said resolution your committee have carefully investigated the facts rendered available by existing records, indicating the date and extent of the agency of John Fitch, of Windsor, in this State, in the practical application of steam as a motive power in the propulsion of vessels on the water, and we find the same sufficient to fully establish the correctness of the following statement:

1. That as early as April, 1785, John Fitch claimed to have invented a machine, using steam as a motive power to propel vessels.

2. That in August of the same year, Dr. John Ewing, provost of the University of Pennsylvania, in a letter to William C. Houston, formerly Member of Congress, certifies to having personally "examined Fitch's machine for rowing a boat by the alternate operation of steam and the atmosphere."

3. That on September 27, 1785, Fitch presented a drawing and model of his boat to the American Philosophical Society of Philadelphia.

4. That on March 18, 1786, the State of New Jersey gave to John Fitch "the sole and exclusive right, for 14 years, of constructing, making, using, and employing, or navigating, all and every species or kinds of boats or water craft, which might be urged or impelled by the force of fire or steam, in all the creeks, rivers, etc., within the territory or jurisdiction of this State."

5. That similar rights were granted to John Fitch by the States of New York (March 19, 1787), Delaware (February 3, 1787), Pennsylvania (March 28, 1787), and Virginia (November 7, 1787).

6. That a boat moved exclusively by steam power applied to paddles placed at its stern, was constructed by Fitch, and made the trip from Philadelphia to Burlington, a distance of 20 miles, upstream and against the current, in 3 hours and 10 minutes, with 30 passengers on board, on October 12, 1788.

7. That a second and larger and more efficient vessel was constructed by Fitch, and made a trial trip on April 16, 1790; and that this vessel was thereafter run as a regular passenger boat during the summer of 1790, between Philadelphia and Burlington, being so completely successful that a regular advertisement of her days of leaving and returning and her place of departure, with her readiness to convey passengers, may be found at repeated intervals and dates in the local newspapers of the time—the Pennsylvania Packet and the Federal Gazette.

8. That an account of the fine performance of this vessel may be found in the New York Magazine of August 13, 1790. Your committee have been unable to find any authentic record of inventions for the successful application of steam to the propulsion of vessels and the actual use of the same, by any person or persons, anywhere in the world, at so early a date as that which is clearly and fully established, by the facts hereinbefore mentioned, to the credit of John Fitch; and they therefore deem it a measure of justice, as well as of proper State pride, that such action be taken, commemorative of the great achievements of this native and humble citizen of our Commonwealth, as that proposed by the joint resolution of this general assembly. Your committee recommend that the full and interesting monograph of the late William Wood, of East Windsor, setting forth the facts of the case, be made a matter of record in the archives of the State, in connection with this report.

All of which is respectfully submitted.

O. VINCENT COFFIN, *Senate Chairman.*
A. FOSTER HIGGINS, *House Chairman.*
(By O. V. C. by request.)
LUKE E. WOOD, *Senate Committee.*
C. E. OSBORNE, *House Committee.*

Fitch spent the last days of his life at Bardstown, Ky. Of his inventions and disappointments during this period, he wrote:

I confess the thought of a steamboat, which first struck me by mere accident about the middle of April, 1785, has hitherto been very unfortunate; the perplexities and embarrassments through which it has caused me to wade far exceed anything that the common course of life ever presented to my view.

Mr. C. Seymour Bullock, in the Connecticut Magazine, says:

Had Fitch been as thrifty as he was inventive he might have become wealthy, for Gardoque, the Spanish envoy to this country in 1796, wished to buy his invention for the sole and exclusive use of the King of Spain. Fitch replied, "No; if there is any glory or profit in my invention my countrymen shall have the whole of it."

It is a sad commentary upon the gratitude of this Nation that no fitting stone marks the grave of this great pioneer.

The bill before your committee seeks a tardy recognition of his great achievements. Its passage would be a belated acknowledgment of the genius of one of America's most illustrious sons.

Mr. Chairman and gentlemen of the committee, I thank you most genuinely for the patient hearing which you have given me, and most sincerely trust that you may see your way perfectly clear to favorably report the bill and urge its passage by Congress.

Mine Experiment and Safety Stations.

EXTENSION OF REMARKS
OF
HON. JOHN M. EVANS,
OF MONTANA,
IN THE HOUSE OF REPRESENTATIVES.

Tuesday, March 2, 1915,

On the bill (H. R. 15869) to provide for the establishment and maintenance of mining experiments and mine safety stations for making investigations and disseminating information among employees in mining, quarrying, metallurgical, and other mineral industries, and for other purposes.

Mr. EVANS. Mr. Speaker, I am greatly interested in the passage of this bill.

If enacted, this bill will provide for the establishment of 10 mine experiment stations and a total of 15 mine safety stations, including those already in existence. It provides for the investigation of conditions existing in mining, quarrying, and other mineral industries and for the disseminating of this information obtained.

The lack of information along this line has been a great impediment and stumblingblock to our national wealth, and the loss financially has been almost inestimable. It will open a new field of development, and there has been a growing realization of this need, and I believe the enactment of this bill will be to the mining industry what the establishment of agricultural experiment stations has been to the farmer. To the farmer now it is almost indispensable; it has saved him fruitless work and great pecuniary loss.

I come from a State having great mineral wealth as well as agricultural resources. It is the Treasure State, and it is well named. Yet the real attainments along this line are still in their infancy; only a small portion of this vast area has been prospected and searched for its costly minerals. Of the minerals that are being mined only the most valuable are being sought. The minerals that cost more to extract from the ore are being cast aside and rendered worthless by erosion and the action of the elements.

A great portion of this ore is obtained two and three thousand feet below the surface of the earth. Should we permit the loss of a great portion of the value of this ore when the scientific knowledge secured as a result of a small appropriation would save it?

It was only a short time ago that the Bureau of Mines in one of its investigations found that there had been a loss of by-products in the coking of coals to the amount of $75,000,000. The bureau is now making a study of industrial carbonization processes and hopes to save much of this loss in the future. It is estimated that the daily loss in our mineral resources is $1,000,000 a day—a colossal sum.

By the establishment of these stations in the needed parts of the country such experiments would result in untold benefit to the whole country, and it is gratifying to know that the miners of the country, through their representative agencies, are awakening to this need.

It may be opportune to note in a general way what the National Government is doing to aid development of each of its great basic industries, and what in turn these two industries are contributing annually to our national wealth and progress.

AGRICULTURE AND MINING, THE NATION'S TWO GREAT FOUNDATION INDUSTRIES—WHAT THEY ARE DOING FOR THE NATION AND WHAT THE NATIONAL GOVERNMENT IS DOING FOR EACH OF THESE INDUSTRIES.

What these industries do for the Nation:

	Agriculture, including forestry.	Mining and mineral industries.[1]
Number of employees	13,000,000	2,300,000
Yearly value of products	$10,500,000,000	$4,600,000,000
What each worker in these industries contributes to the national wealth yearly	$800	$2,000
What each industry contributes to the freight tonnage of the country yearly.....per cent..	22	60

[1] The scope here includes mining, metallurgical, and other mineral industries, as does the work of the Bureau of Mines.

What the National Government is doing for each of these industries:

Yearly appropriations.	Agriculture.	Mining.
For education:		
From direct appropriation	$2,500,000	Nothing.
From land grants	1,030,000	.....
From Smith-Lever Act for demonstration educational work	[1] 480,000	.....
For 52 experiment stations, one in each State and Territory	1,550,000	Nothing.
For general researches and other work to aid agriculture and mining	22,410,000	[2] $1,967,000
Total	27,970,000	[2] 1,967,000
Per capita contribution from the people of the United States for the advancement of these industries	0.28	0.02
Of this contribution the per capita expenditure for safeguarding the lives of 2,300,000 employees in the mining industry is about one-half of 1 cent per annum	.....	.005

[1] $480,000 for 1915; increasing to $4,580,000 for 1925 and each year thereafter.

[2] Of this amount less than $500,000 is expended under the Bureau of Mines in behalf of improvement of safety and health conditions among the 2,300,000 employees in the mining industry; the remainder (about $1,300,000) is expended for geology, topography, water powers, and other problems having to do with the commercial side of mining and other industries, under the Geological Survey; and $135,000 is expended under the Bureau of Mines for the commercial testing of the coal and oil used by the Government.

Nothing can show the national neglect of the mining industry more clearly than does the above tabular statement, in spite of the hazards of that industry and the other conditions which should appeal to the humanitarian as well as to the commercial instincts of the people. But another fact that tells the story with equal emphasis is that during the past 10 years, in addition to the large sums paid out of the National Treasury for the benefit of agriculture and the payment toward the reclamation of agricultural lands in the Western States of all funds arising from the sale of public lands in those States, even the proceeds of the sale of the Nation's mineral resources in like manner have gone not to aid mining, but to the reclamation of additional agricultural lands.

Our agricultural wealth is dependent greatly upon the efforts extended along that line. Our minerals can only be mined once, and when the value is extracted from a mine another must be found to take its place. It is clearly seen that we must spare no efforts to get the full value from each mine, and not allow it to be wasted through ignorance or neglect in mining methods.

Congress is now appropriating for agriculture upward of $28,000,000 per annum, which is being expended through an organized department with nearly 14,000 employees. Even this large expenditure has resulted in still larger benefits to the country. And I would be the last one to say that this amount is needlessly spent. One of the evidences is that in the last 14 years our agricultural wealth has increased $4,000,000,000.

The Federal appropriations for the mining industry have been noticeably small.

While conditions underlying agricultural progress are somewhat different, yet the principle of progress is the same. Through the efforts extended in one instance alone by the Bureau of Mines, the national wealth through the stoppage of waste in natural gas exceeded $10,000,000.

The mining business has been considered to be a business controlled by a few powerful companies, and therefore not entitled to any governmental aid. The lack of such aid is one of the reasons why smaller companies have been compelled to sell their interests to the larger companies. They do not know, and it costs too much to learn, the systems of mining and mining economy. It is the smaller mine operators that will benefit greatly by this aid, and the Director of the Bureau of Mines has reported that many of the large holders have promised to contribute largely to any such research work.

The appeal comes from the 2,300,000 employees of the mining industries who want better and even more healthful conditions in their work. It is from the employees of operators connected with smelting, metallurgical operations, and various mineral industries that the passage of this bill is urged.

Our country has but one supply of mineral resources, and we should take care to utilize this supply to the best advantage. We should devise such systems as will best preserve it to our use. Our needs are growing greater every day. While our metals are destroyed rapidly, it is also true with coal, oil, natural gas, potash, and phosphate deposits. They are destroyed when once used. The results of the European war have placed this country upon its own resources for many minerals. There is a large waste in our natural fuels and zinc, and this could be saved to a great extent.

In the State of Montana there are large beds of low-grade ores of different types. Much of this can not be profitably treated according to any known method. Other bodies of ores are now being worked with the loss of vast quantities of mineral products. The value of many of these products in the public-land States is little realized, and by the establishment of stations these problems could be investigated. In many cases ores from which copper has been taken are now being reworked for the copper that was lost in the first treatment, and for other values not saved in the first process. There has been a large waste and avoidable expense in doing this. As our supply becomes exhausted, we will have to resort to this treatment more than ever, and it deserves every consideration.

Such stations could be controlled by the Bureau of Mines, and it would be a great aid in many ways, and the expense would be very small, and the experiments would be available to the public, and not, as suggested, only to the corporate interests.

This bill also provides for more protection to the workers by way of mine safety stations. For the protection of over 2,000,000 of mine workers the Government expends only $200,000 for their protection and welfare. We can make no mistake in lending aid along this line, and I would like to see it. The field for the perfection of safety appliances and mine rescue work is unlimited. Many men now go down into the depths of the earth never to return, and miner's consumption and other diseases of a similar nature have cost the lives of many of our young workers. It is estimated that in the last 10 years more than 30,000 men have been killed and more than 100,000 seriously injured in connection with mining accidents in our country. It is appalling to think of this.

While we are doing so much good work for the farmer, we should not forget the miner and his hardships. If we can preserve the health of our miners and increase our mining wealth and make our production greater by the expenditure of a small amount, we will bestow a great benefit upon humanity and increase the world's wealth.

I believe the inauguration of a system along the lines contemplated by this bill will be helpful and productive, and I urge the support of the bill.

Mr. Speaker, the amount of gold, silver, copper, and zinc and other metals which annually goes into the dump heap for lack of knowledge of treatment is simply appalling. There are hundreds of mines to-day in our western land where the tailings of the dump of 20 years ago are now being worked over and returning good compensation for the workmen.

The Sacredness of Jury Trials.

EXTENSION OF REMARKS

OF

HON. WILLIAM H. MURRAY,

OF OKLAHOMA,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, March 2, 1915.

Mr. MURRAY. Mr. Speaker, we may make experiment in forms of administration as to policies of government, but there is no room for such experiment in the well-established principles of liberty except with a view of extending that liberty, but in no case to curtail it. In the Oklahoma constitution we made change in the common law, which had been universal, for the first time among English-speaking peoples, by providing for jury trial in cases of ex parte contempt, which power, inherent in a court of record, had in late years been abused when applied to labor organizations; but we did not attempt to curtail the power of trial by jury. I realize that there are those who tell us that they had rather be tried by a judge than by a jury. Men who make this statement have usually served long periods as judges, and who have become prejudiced by their inability to control the verdict of juries. But were they subjected to political persecutions and to trial by military tribunals, without the right of trial by jury, or were they to delve into past history sufficiently to obtain a deep conviction of the usurpation of the judiciary, they would look upon this question quite differently. Students of history intimately acquainted with the events which happened immediately following the Civil War, particularly in the military trial of Mrs. Surratt and her associates and their subsequent execution, will shudder at any sacrifice of the rights of popular trial by jury, an institution which had its inception in England among our ancestors, beginning in the popular demand in the right of trial by one's "peers."

The military execution, under the name of a so-called trial by the judge advocates, just after our Civil War, began to become so harsh that finally one Milligan, a penniless lawyer, was defended perhaps by the greatest lawyer—Jeremiah S. Black, of Pennsylvania—this country ever produced, and is known as the case of "Ex parte Milligan." It is known that Mr. Black never received a cent of fee for this work, but he realized that if Milligan, as poor as he was, could not secure his constitutional rights there would ere long be no guaranty that any other person could secure them. Whereupon Jeremiah Black became interested, and went into the Supreme Court with the popular prejudice growing out of the great Civil War against his client, delivered the greatest argument in favor of jury trials known to man, and saved this right not only to the friendless Milligan but to every American citizen since that time. Theorists now seek to change our constitutions by giving supreme courts greater control over verdicts of jurors, but it is dangerous to permit it.

As one English statesman well puts it, in the first adoption of the jury system of trials in England every law upon the statute book had for its object the selection of 12 honest men for the jury box. So that Mr. Black in this speech has well said "that the development of the Anglo-Saxon race is due to jury trials more than to any other causes."

Thomas Jefferson has well said, "That between taking the people out of the legislative branch of Government or out of the courts, they could better afford to leave monarchs to make the laws than they could to leave judges alone to pass upon the rights of the individual citizen without the right of trial by jury." The ordinary man, daily accustomed to these rights of trial by jury, can scarcely realize the philosophy of Jefferson's statement. I never did until I moved to the Indian Territory, where we had a government wholly of courts. The people of the Indian Territory had no right to vote, no right to make law, as all laws were made at Washington. They had no right to select their officers. The only thing they had left was the right to fill up the juries from among their citizens; and I say to you that during the many years of my residence in the Indian Territory, if it had not been for that right of the people to go in and compose the juries, it would have been intolerable to have lived in that country. So I shall look with abhorrence upon any proposed change, whether in State or Federal Government, experimenting in these fundamental safeguards of the liberty of the citizen, chief among which is the right of trial by jury.

No one can read the great and profound argument of Jeremiah Black, delivered during the days following the Civil War, and which was placed in the CONGRESSIONAL RECORD October 6, 1914, by the Hon. WILLIAM GORDON, of Ohio, and yet escape the conclusion that I have here announced with reference to this, the most important of rights.

Agricultural Credit.

EXTENSION OF REMARKS

OF

HON. GUY T. HELVERING,

OF KANSAS,

IN THE HOUSE OF REPRESENTATIVES,

Monday, March 1, 1915.

Mr. HELVERING. Mr. Speaker, the necessity of a system of agricultural credits is something which but few will deny. Practically every nation has come to not only see the need, but to take steps to remedy the evils which tend to make the burden on the farmer so heavy that his work becomes a grind which holds out no hope for the future; and the very bleakness of the future is such that it is driving his sons away from the farms

In 1910 the farm-land mortgage indebtedness of the United States amounted to the enormous sum of $3,460,172,851. On that amount of indebtedness the farmers and landowners of the country are paying an annual interest toll which approximates $7 per capita for every man, woman, and child in the United States. It is the consuming public which must finally pay that debt, as it must pay every expense entering into the production cost of the things it consumes, and consequently every family of and to the cities, where they can secure day wages and be certain of a surer and safer income than they can derive from the cultivation of the farm.

five in these United States is paying an annual consumption toll of $35 in order that the producers can carry this debt.

How are we going to diminish this evil? How are we going to provide means so that the farmer can get the money needed for improvements and for actual necessities at a reasonable price? We can not sweep these questions aside, as only affecting the farmer. They affect each and every one of us, and they affect the generations yet to come, because just to that extent that we afford the farmer a chance to live and share in the reasonable profits made in our country just to that extent will we stimulate productiveness, make of the farmer's life a more attractive one, and insure to the future conditions which will supply our needs and at prices which are not prohibitive.

But once we are agreed as to the need of a system of agricultural credits we are met at once with a stumbling block in the shape of divergent views as to the kind of a system we most need. Many men sincerely believe that the solution lies in cooperation, and joined with them are many others who are equally sincere—but it is with the sincerity which selfishly strives to retain unjust advantages which now fill their pockets—and these men are for cooperation, simply for the reason that they feel that cooperation will fail and the golden stream which now runs in their direction will not be diverted.

Among the latter class I would place those who have been flooding myself and the other Members of this branch of Congress for the last few days with telegrams objecting to the rural-credits legislation passed by the other body. These telegrams are usually sent by some investment company, and when you have read one then you have the substance of all. They object to the legislation proposed as being ill-advised and not intelligently framed or digested. They favor rural-credits legislation, at least they tell us that they do, but they would favor delay, which is simply the time-worn method of keeping an injustice as long in existence as possible, particularly when the injustice means personal profit to those who plead for delay.

There is not one Member of this House, receiving these messages, who does not realize that the senders are not so much opposed to ill-advised legislation as they are to any legislation which would decrease the interest burden. They have filled their coffers by loaning money to the farm owners at exorbitant rates and when you strike at their graft you are bound to arouse resentment, but as they well know the selfishness of their motives they are forced to appear in borrowed plumage and they would advise us to pause lest we do injury to our country by passing ill-digested legislation.

From the outset I have been convinced that if we are to depend upon cooperation wholly for the solution of our agricultural-credits problem then we will fail totally, and instead of making progress in the direction desired we will give to the reform such a black eye that its progress will be delayed for years, and perhaps forever.

We can not ingraft European customs, no matter how successful they may be on the Continent, on to our American life until such time as American environment and customs come more closely to European standards, and that time, I hope, never will come. To insure cooperation we must have mutual understanding and common aims. In Europe you can take the many families tilling the soil on a square mile of land and you will usually find that the same identical soil was tilled by the ancestors of the present holders from time immemorial. Each and every one of these people have a thorough knowledge of each other. They know that as long as natural causes operate the same family will be holding on to the same land just as long as life lasts, and between such people, bound by all sorts of ties of nationality, blood, and understanding, cooperation is not only possible but it is natural.

How different conditions are here in this land of ours. You can take a section of land, tilled by four families, and often you will find that no two of them are of the same race. The neighbor of to-day may be in the far West or in Canada tomorrow. Our form of Government leads also to independence of thought and of action, and to that extent it does not lend itself so well to cooperation between individuals as does the Government which molds the individuals so that they think and act alike. Cooperation has never succeeded in this country, except upon a limited scale, and it never will succeed until the time in the far distant future, when the melting pot will have operated to such purpose that the stamp of all other nationality will be obliterated and all will be working in the harmony of men and women who are Americans, and Americans only.

There is no future for agricultural credits, in my opinion, from cooperation without Government aid, and for that reason I favor the McCumber plan, crude and faulty as it is, and, failing in that, I shall vote for the Bulkley bill, for, although it falls far short of giving to the agriculturists the relief which they demand, and which I would like to see them secure, nevertheless it means a step in the right direction. We have promised the people to give to them legislation providing for rural credits. At the special session held in 1913 the Democratic Representatives went on record in a promise to give them such legislation before this Congress adjourned. I for one am not willing to violate that pledge, and I prefer to vote for this legislation now, and work to perfect it in the Sixty-fourth Congress, rather than to aid in defeating all legislation at this session and go back to my constituents and explain a pledge violation.

I am not content with the McCumber proposition. To issue bonds at a rate of 4½ per cent interest is entirely unnecessary, and would only mean that the interest rate to be charged the farmers would be greater than is needed. I am not content with the Bulkley bill. It has many admirable features, but the machinery provided seems to me to be unduly top-heavy, and I am not in favor of permitting the interest rate under the bill to run as high as the interest rate legally permitted in the various States. The interest rate should be governed wholly by the cost of obtaining money and of loaning it under the legislation we enact, and we should be guided more by the interests of the people of the country than we should be by the limitations of the various States.

It is strange to me that every time a proposition is advanced here for the benefit of the American people that we should be

met always with the cry that it is "unconstitutional." I claim to have as much regard for the Constitution as any man. I admire the wonderful handiwork of the men who framed it, and I fully realize that it has proven itself admirably adapted to the needs of this Republic. When one considers that its framers had to blaze a path entirely new and provide a Constitution to cover conditions unlike any the world had ever seen, it seems little short of providential that it has so fully performed its mission. But, after all, what is a constitution for, if not to be an instrument of good for those who have to live under it? Are we compelled, perforce, to always make a narrow construction of its provisions, or are we to realize that as we have made progress, have blossomed forth into a Nation of 100,000,000 people, instead of the few millions originally brought under its guardianship, so have we come to solve new problems, have been brought face to face with new needs, and are forced to intelligently, or else suffer needless loss? Is it not evident, then, that there is no place in a Republic for a narrow construction of the fundamental law when by a broad construction we minister to the greatest good of the greater number and neither destroy or injure any vested right possessed by the individual?

But will those who claim that the legislation proposed is unconstitutional, because of the fact that as they see it it will benefit only a class, will they claim that we have not plenty of congressional precedents to justify our action? If this legislation is unconstitutional, as they claim, have we not passed many other acts equally unconstitutional, but whose validity has not been questioned? Let us see.

This legislation does not propose to place the Government in the attitude of giving the farmers anything, and they have too much self-respect to come here and ask for charity at your hands. It does propose to place the Government in the position of responsible agent, to do for the borrower on farm property that which he is unable to do for himself, and that is to bring him into closer relationship with the money which is seeking a market in which it can be safely loaned. The Government assumes no risk. The expense it has to undergo is certain to be paid back. The loan which it arranges is secured by twice the value at least of the amount involved, and there is no more of paternalism or of special privilege in that than the relationship which this Government bears to our banking system.

Now let us examine some of the precedents. We have appropriated millions of dollars out of the Government Treasury to be used on irrigation projects. In some instances we have made this expense reimbursable to the Government by the lessees of the land, just as we make the money expended under this legislation reimbursable. In some cases we have made the irrigation expense a direct charge upon the Treasury and have not received a penny of it back. Under irrigation legislation the money invested, even though hinged around with restrictions providing that it is reimbursable, is always involved in more or less of speculative risk. In the instance of farm loans, as safeguarded in the legislation we favor, there is no possible risk involved. Where, then, can it be shown that our proposition is unconstitutional if the appropriations made for irrigation projects were not?

Citing an incident which must be fresh in the minds of all Members, I would call attention to something that happened here shortly after the breaking out of hostilities in Europe. At that time many thousands of our fellow countrymen and women were in the territory drawn into the war. Their drafts and letters of credit were of no use, moratoriums were declared in many sections, and our people found themselves abroad in strange lands unable either to pay for the means of living there or for the means to take them to the country of their citizenship.

The President laid this problem before the Congress, and we promptly appropriated the sum of $2,500,000, reimbursable as far as possible, to be expended in caring for our people abroad. Did any one of the ultraconservatives here on the floor raise the issue of the constitutionality of that piece of class legislation? If they did they would have met with deserved censure. We were called upon to do the large thing—to provide for American citizens who were in danger—and the Constitution would but illy meet our needs if it prohibited us from doing such an act of humanitarian necessity.

I have no desire to be narrow or to array class against class or section against section. Nevertheless, there were mighty few of those who ask for agricultural credits legislation who had to be assisted out of the $2,500,000 which we appropriated for our people then in Europe; but many of the constituents of those who now express such a horror of class legislation and who deem that Government participation in farm loans is unconstitutional were to be found among the European colonists. Did these Representatives arise here to protest against us appropriating $2,500,000 to aid a class; and if not, would it not be in better taste for them now to cease to raise the point when we propose to legislate, not for a class but in reality for the masses—ultimately for the benefit of all of the American people?

Gentlemen, this is our one and only opportunity to make progress in the direction of securing agricultural relief at this session. Can we afford to ignore that opportunity? The farmers of the country are asking for it, while on the other side we find the money lenders in opposition. On which side do you propose to take your stand? Let us admit, and we will, that this legislation is not what we want it to be. Let us admit that it would be far better to deliberate and remove all crudities; but, with all that, is it not far better that we should take this first step, spend the next few months in studying to amend and improve, and come back here at the next session prepared to round out and perfect our work than it would be for us to vote down the proposition, play into the hands of the usurers, and come back here next winter still as far apart as ever?

This may be only a step, but it is a step in the right direction. It will be followed by others which will give to the tenant a chance to become an owner, and once we have solved that problem we will have afforded to the producer the golden opportunity to secure a greater share of the products of his toil and we will have proceeded a long way in the direction of stopping our annual toll of American farmers to Canada and will have at the same time solved the problem of the exodus of the best blood of the farms which has in recent years been directed from the farm and to the cities. Make farm life more attractive and you will aid in this by the enactment of the legislation which we favor and you will hear much less of the need of a "back-to-the-farm" movement.

The Late Hon. Lewis J. Martin.

MEMORIAL ADDRESS

OF

HON. WILLIAM J. BROWNING,

OF NEW JERSEY,

IN THE HOUSE OF REPRESENTATIVES,

Sunday, February, 14, 1915,

On House resolution 735, as follows:

"*Resolved*, That the business of the House be now suspended that opportunity may be given for tributes to the memory of Hon. LEWIS J. MARTIN, late a Member of this House from the State of New Jersey.

"*Resolved*, That as a particular mark of respect to the memory of the deceased and in recognition of his distinguished public career the House at the conclusion of these exercises shall stand adjourned.

Mr. BROWNING. Mr. Speaker, during this Congress, soon to pass into history, death has entered the House frequently, and in its visitations its hand has been laid indiscriminately upon both young and old alike. Those young in service and young in years have been beckoned away as well as those who were seniors both in years and in service in this House.

My colleague, Judge MARTIN, had lived beyond the allotted three score years, a life of usefulness and of public service, and was ready for the summons that came to him suddenly, before he had become fully acquainted with his duties here.

My other colleague, the lamented Bremner, was but a boy in years, ambitious for service for his fellow men, and but a short time among us, when he, too, was called to join Judge MARTIN.

So, Mr. Speaker, in my own delegation we have seen in this Congress, within a brief two years, an illustration of the truth of the saying that death is no respecter of persons.

But as brief as was Judge MARTIN'S service in this House, a few weeks only, he had won the hearts of all who were privileged to meet him. Possessing an attractive personality, that made him easy to approach, and himself having no hesitancy in making himself known to strangers, Judge MARTIN was not long in becoming identified in the House as a genial gentleman of the old school, whose personal qualities would win for him the friendship of his colleagues, regardless of partisan politics, and we, who have been in the crucible of the House's opinion of its own Members, know what a valuable asset the friendship of our colleagues is. It stands us in great stead at times, even when wisdom and ability fail.

But Mr. Judge MARTIN'S charming personality was not his only or chief possession. He had ability for useful and effective service in this body. He had a legal mind and legal training, and legislative experience in the New Jersey Senate. He was a born advocate, but his advocacy did not prejudice his mind, nor blind him to the fact that there are two sides of every

question. He was a judge, and as such construed and interpreted law impartially and justly. When Judge MARTIN rendered a decision there was general acquiescence, for litigants on both sides knew that he had weighed the evidence and interpreted the law as only a just man and a just judge would.

"To be true and just in all my dealings," was to Judge MARTIN the rule of life; and how well he lived up to this rule could be attested by the host of friends in old Sussex County, who mourn his death and love the memory of his good works.

Mr. Speaker, environment, as much as anything else, molds character. So it was in the formation of Judge MARTIN'S character. In old Sussex County, where he was born and where he always lived, he led a simple, rugged life, as most of his neighbors did. He partook of his environment. The people of old Sussex were a God-fearing lot, who believed in working out their destiny by honest, hard work in that state of life into which it has pleased God to call them. They were content with their lot, but it was a contentment that made for progress where progress was not at the expense of a less fortunate neighbor. They were honest folks, who valued character above ill-gotten gain. They were sober, discreet, law-abiding, just. It would seem that something in the community itself, apart from men, perhaps in the very nature of the physical character of old Sussex County with its soil, its homes, its places of worship, its history, its templed woods, contributed to the sturdy integrity and right manner of living of its people. Whatever it was and is, it makes for the building of fine character, and in Judge MARTIN was found an excellent sample of a product of old Sussex. His whole life was a preparation for the sudden summons that came to him.

Naval Appropriation Bill.

SPEECH

OF

HON. ALBEN W. BARKLEY,

OF KENTUCKY,

IN THE HOUSE OF REPRESENTATIVES,

Friday, January 29, 1915.

The House in Committee of the Whole House on the state of the Union had under consideration the bill (H. R. 20975) making appropriations for the support of the Navy for the fiscal year ending June 30, 1916.

Mr. BARKLEY. Mr. Chairman, in view of the attitude of some Members of Congress toward our naval and military forces, and our preparedness and unpreparedness for war, I desire to call to the attention of the House a few facts which I have gleaned from recent investigation upon this subject.

I suppose that if some inhabitant of one of the planets, if, as some of the astronomers tell us, they are inhabited, should drop suddenly into this Chamber on a day when the House is engaged in discussing our military and naval affairs he would immediately reach the conclusion that the chief object and ambition of the inhabitants of this world is to fight. He would undoubtedly reach the conclusion that the major portion of our discussions and even of our occupation revolved around the question whether one nation should fight another, and, if so, how best to engage in that occupation with the most deadly effect.

It is a source of much regret to me, and in my opinion a sad commentary on our so-called Christian civilization, not of our Nation alone but of all nations, that the representatives of any great nation should be called upon to occupy their time in talking about war. Yet, inasmuch as we are called upon to discuss it, in view of our moral as well as our intellectual limitations, it undoubtedly behooves us to discuss the subject in the light of our preparedness or unpreparedness for war as well as the method of its pursuit.

I need not, Mr. Chairman, at this time reiterate my hatred of war. I do not believe there is a rational being who does not in his heart hate war; for who is there among us with heart so cold or conscience so dead as not to hate this thing that is to-day drenching one-half of the world with blood, and is causing more suffering, the expenditure of more money, the loss of more lives, the shedding of more tears, and the creation of more desolate widows and orphans than in any other period of the world's history?

War plants no fields, it gathers no harvests, it builds no churches, it educates no children, it creates no wealth, and adds no item of happiness or contentment either to those engaged in it or to those who are affected by it. It endows no schools or universities, it plants no flowers, either in the garden or in the hearts of men; but, on the contrary, it destroys those things for which humanity has been toiling and laboring since the world began. Instead of planting fields or gathering harvests it plants hatred in the hearts of men and reaps its reward in the tears of women and children. Instead of endowing churches, schools, or universities, it heaps upon those who are left an enormous burden of debt and taxes from which there is small hope of escape. It is contrary to every contention of the Christan religion, contrary to every impulse which tends to ennoble or lift up the human race and aid mankind in the effort to rise from barbarism to civilization.

Since the outbreak of that terrible war that is now engaging all Europe, a part of Asia, Africa, and America, we have heard much in this country about our own readiness or unreadiness for war, and I regret exceedingly that among some of our people the war spirit has found a fertile field for cultivation.

I have been much interested in the discussion that has been going on among certain gentlemen during these months upon the subject of our unpreparedness for war, and I have been anxious for them to tell us when we will ever be prepared for war. If we, as a nation, are to keep ourselves continually prepared to fight, will some one inform us what war we must be prepared to fight, and what nation there is any likelihood of us being called upon to fight? Will they also tell us how much money it will require to keep us continually prepared to fight, with our guns drawn and our hands upon the trigger? What nation now besets our footsteps with a desire to fight us? What lurking enemy hides in ambush to pounce upon us unawares? If we are to be continually ready to fight, and then it should happen that nobody wanted to fight us, what will we do with our preparedness for war? Should we then embark upon an effort to find some nation with whom we might pick a quarrel in order to demonstrate our preparedness for war? And if such a search should not reveal any nation who might desire to engage in such a contest, would we then force such a nation to fight merely because we could, or to justify the enormous expenditure of money that such a course would entail? Or suppose some other nation or nations, observing the rapidity with which we are preparing to engage in some international contest, should desire to keep up with us in preparedness, so as to be entirely ready when such a contest should arise; can anybody, even with the most vivid imagination, predict the point to which an unwise policy would bring us in the long years that stretch out in the future?

Mr. Chairman, to speculate upon a policy of this kind is as futile as to speculate as to the time of the coming of the millennium, or the second coming of the Messiah. You may as well undertake to solve the problem which has divided scientists, scholars, and theologians in all the years of the past, to wit, whether God made the earth and all that is in it, under it, or above it, in six days, or whether it was created by a process of evolution which required thousands of years. You might as well undertake to solve the question whether God made man out of mud and breathed into him, instantly, the breath of life, or whether, as the evolutionists tell us, he came up through an endless series of evolutions from the monkey, the babboon, and the ape.

If our standing as a fighting nation and our preparedness for war should be determined by the amount of money expended by the United States, compared with that expended by other nations, then it will be profitable for us to make some comparison in order to determine our own status with relation to that of the other nations of the world. If the relative amounts of money expended by every great nation in the world is a true index of the preparedness of those nations for war, then the United States should be, and is, prepared to cope with any nation on the earth, either on land or on sea, with the possible exception of Great Britain—the only nation whose naval expenditures exceed that of this Government.

My friend from Ohio [Mr. FESS] a few moments ago gave a very beautiful and touching illustration of the effect of the Spanish-American War upon the history and policy of this Nation, in connection with his tribute to the life of President McKinley. He mentioned as one of the results of that war that the North and the South had been thereby united, because Gen. Joe Wheeler, who was an officer in the Confederate Army during the Civil War, had also become an officer in the United States Army during the Spanish-American War, thus bringing about the reunion of the North and the South and wiping out to a certain extent the bitter feeling that had heretofore existed. But, Mr. Chairman, I hope I am not wholly uninformed when

I state that it was not the war of 1898 between the United States and Spain that reunited the North and the South. That reunion had already taken place. Coming from the South, as I do, I do not hesitate to state that already the North and the South had been reunited and rebaptized in the spirit of patriotism, love, and brotherly affection; but I agree with the gentleman from Ohio that this war of 1898, and the fact that men from both the North and the South fought shoulder to shoulder in that war, merely exemplified the reunion that had already taken place in the hearts of the American citizens, both in the North and the South. [Applause.]

But with the manifestation of this reunited spirit of America before us we can not shut our eyes to another result that was perhaps inevitably brought about by the issue of that war. I refer to the enormous increase in the expenditure of the people's money for increase in armament, both on land and on sea, since the close of that war.

It is amazing to me when I compare the enormous, and as it seems to me, criminal increase in the expenditures of the money of the people of every nation for military purposes during the last 15 or 20 years; when I consider the fact that this enormoust increase in the military expenditures has not only been of no benefit to the people, but may be directly responsible for the greatest military struggle that the world has ever seen, which is now in progress across the waters, it seems to me that we should not be swept off our feet, but should pause in this hour of the world's great catastrophe and engage in the helpful occupation of self-investigation, in order that we may not lose our sense of proportion, nor lose sight of the eternal fitness of things.

Let me give you for your serious consideration, in connection wth the tendency of this age, the figures of the seven greatest nations in the world, comparing the amounts expended for naval purposes during the last 15 years:

Total naval expenditures by principal naval powers.

Fiscal year.	Great Britain.	United States.	Germany.	France.	Russia.	Italy.	Japan.	Total.
1900-1	$145,792,850	$61,721,695	$37,173,074	$72,683,180	$42,101,212	$23,829,206	.....	.....
1901-2	150,569,190	68,438,301	46,315,800	67,097,011	45,488,462	23,875,532	$21,373,954	$423,140,250
1902-3	150,679,328	82,977,641	48,818,700	59,217,558	50,769,465	23,522,400	17,654,528	433,639,620
1903-4	173,543,058	104,126,192	50,544,000	59,740,222	60,018,895	23,522,400	17,553,279	489,053,046
1904-5	179,138,049	116,655,826	49,110,300	60,178,623	58,076,543	24,300,000	10,018,024	497,477,365
1905-6	161,117,947	109,725,059	54,918,000	61,565,779	60,228,444	24,494,400	11,378,202	483,427,831
1906-7	152,951,342	98,392,144	58,344,300	59,514,296	60,703,557	25,865,668	30,072,061	485,846,368
1907-8	151,880,617	117,353,474	69,133,500	60,685,813	43,012,166	27,516,454	35,124,346	504,706,370
1908-9	156,401,161	120,421,579	80,737,626	62,194,916	49,682,482	30,453,697	39,347,332	539,238,793
1909-10	181,936,341	122,247,365	95,047,820	64,899,589	58,680,915	31,812,885	35,005,719	589,008,759
1910-11	202,056,258	111,791,980	103,302,773	74,102,439	46,520,465	40,595,204	36,889,158	615,258,277
1911-12	211,596,296	133,559,071	107,178,480	80,371,109	56,680,915	40,780,987	42,944,329	673,111,187
1912-13	224,443,296	129,787,233	109,989,096	81,692,832	82,019,633	41,893,420	46,510,216	716,335,726
1913-14	237,530,459	136,858,301	112,091,125	90,164,625	117,508,657	49,550,147	48,105,152	791,808,466
1914-15	260,714,275	141,872,786	113,993,329	123,828,872	128,954,733	56,920,440	69,111,653	895,396,088
Total	2,740,358,467	1,655,828,647	1,136,727,923	1,077,918,864	959,823,669	488,932,840	461,087,953	8,137,447,146

It will be seen from these figures that for the years 1901 to 1915 the United States increased her naval expenditures from a little more than $61,000,000 to more than $141,000,000; that Great Britain for the same period increased her naval expenditures from more than $145,000,000 to more than $260,000,000; for the same period Germany increased her annual naval expenditures from more than $37,000,000 to more than $113,000,000; that France for the same period and for the same purpose increased her expenditures from $72,000,000 to more than $123,000,000; that Russia increased her naval expenditures from a little more than $42,000,000 to more than $128,000,000, and that Italy increased her annual naval expenditures from a little over $23,000,000 to nearly $57,000,000, and that Japan, that great nation in the Orient, which rises up to plague our genial friend from Alabama [Mr. HOBSON] in all his nocturnal dreams, increased her naval expenditures from a little over $21,000,000 to nearly $70,000,000 in the same period.

It will be observed that for the year 1915 the only nation which will exceed the United States in the expenditure of money upon her Navy is Great Britain. During the 15 years it will be observed that Great Britain expended upon her navy the enormous sum of $2,740,358,467, that the United States during that period expended upon her Navy the enormous sum of $1,655,828,647, that Germany during this 15 years has expended upon her Navy the sum of $1,136,727,923, that during that same period France has expended $1,077,918,864, that for the same period Russia has expended $959,823,669, and that Italy has expended $488,932,840, and that for the same period Japan has expended for her navy the sum of $461,087,953.

Thus it will be seen that for the past 15 years Great Britain exceeded the United States in the expenditure of money for naval purposes by he sum of $1,084,529,820; and that the United States for the same period and for the same purpose expended $519,100,724 more than the German Empire. Yet, Mr. Chairman, according to the report of the Committee on Naval Affairs, accompanying the present appropriation bill, England stands first in naval strength, Germany second, and the United States third among the nations of the world. In other words, notwithstanding the fact that during the last 15 years the United Sates has expended more than half a billion dollars more upon her Navy than Germany has expended, it is claimed by the Naval Committee that Germany outranks the United States as a naval power.

Mr. FESS. Will the gentleman yield?

Mr. BARKLEY. Yes; I will yield.

Mr. FESS. I am interested in those figures. Is that the sum total for many years?

Mr. BARKLEY. That is the sum total of the nations which I have named, beginning with the year 1901 and ending with the present year, 1915.

Mr. FESS. Well, according to that we ought to have a higher rank and force.

Mr. BARKLEY. That is the point to which I am coming. It is admitted on all sides that, by reason of the widely scattered possessions of the British Empire, together with the situation of the British Isles, it is necessary for that nation to preserve her superiority upon the high seas in order to maintain the integrity of her territory and protect herself against displacement as one of the great nations of the world. Therefore it is not contended, even by those who believe in a large Navy for the United States, with few exceptions, that we ought to undertake to maintain as large a Navy as the British Empire. The reasons for this are obvious. The British Empire is composed of a large number of islands and sections of territory scattered through the length and breadth of the earth. The very existence of that great Empire depends very largely upon her naval strength. This is not true of any other nation in the world, although it may be true at some time in the future of Japan, whose situation in the Orient is somewhat similar to that of England in Europe. We may therefore dismiss from discussion the contention that the United States Navy is under any necessity, either real or imaginary, to outstrip or to equal the strength of Great Britain.

But it has been contended by those who have set the high standard for the naval policy of the United States that we ought to maintain as large a Navy as Germany. In other words, that we ought to accept Germany as our standard and keep our Navy as large, at least, as the Navy of the German Empire. The question, therefore, which causes me some consideration, is that if it is our aim merely to keep pace with Germany, why is it that we have in the last 15 years expended upon our Navy half a billion dollars more than Germany has expended upon hers, and yet Germany outranks us as a naval power? If the amount expended is a true index of the efficiency or strength of a navy, then we ought at least to be the second naval power of the world, and we ought by far to outstrip Germany, or else somebody has gotten a profit out of the construction of naval equipment to which they are not entitled.

Mr. PADGETT. Will the gentleman permit me to interrupt him just at that point?

Mr. BARKLEY. I will.

Mr. PADGETT. Earlier in the evening I called attention to the fact that for the year 1913, as an illustration, the United States paid for pay of the Navy, pay of the men, $44,300,000;

Germany paid $11,400,000, having a conscription system. For provisions the United States paid $8,600,000; Germany paid $900,000. For clothing the United States paid $1,400,000 and Germany paid $140,000. In other words, the United States has paid $54,000,000 for these items, for the men, as against $12,000,000 for Germany, or, in other words, a difference of $42,000,000; and if the gentleman will run it through for 15 years he will get the explanation. And then, in addition, I will call to your attention that in 1913 for new construction the United States appropriated $35,315,000, and Germany appropriated for new construction $53,568,000. In other words, for the benefit of humanity, the men, the United States spent $44,000,000 a year more, and for new construction Germany spent $18,000,000 a year more. That explains your figures.

Mr. BARKLEY. I am not charging anybody with anything wrong in connection with these figures. I just wanted to have an explanation. If it is true that all of this difference is made up in salaries and in clothing and allowances to officers and men in the Navy of the United States, and if it is true that the German officers and navy personnel is so efficient as it is claimed, then Germany is paying too small salaries or we are paying too large salaries. And the whole difference in the amount in the last 15 years between Germany and the United States is not made up in salaries paid to naval officers.

Mr. PADGETT. If the gentleman will permit a question?

Mr. BARKLEY. I yield for a question.

Mr. PADGETT. The gentleman will recognize that the wage level of pay and wages paid for construction in this country and Germany is very different, Germany being much lower than here.

Mr. BARKLEY. The point I was undertaking to emphasize was the fact not that part of this difference could not be accounted for in the salaries of officers and other necessary evils connected with the naval service, but the claim has been constantly made, not only to-day, but in all of the naval bills that have been reported in the last several years, that it has been the object of the United States merely to keep pace with Germany; that we have set Germany as our guidepost, so to speak, that we will hold up as an example for naval construction, and I wanted to show the House and the country that we have in the last 15 years spent $519,000,000 more than Germany, according to the admissions of the big Navy men on the floor of the House, and we are no stronger now as a naval power than Germany, and according to the report of the committee, not as strong.

Those who are now claiming that we ought to embark in the expenditure of much larger sums of money to increase our Navy took steps to accomplish that result years ago. If our Navy is so inferior, in the opinion of the jingoes, what has become of all this money which has been expended upon the American Navy in the past 15 years? And if our Army is so inferior, what has become of the great amount of money which has been expended upon it in recent years? Is it all going to salaries of officers, some of them active and some retired? Is some of it going for enormous profits to those who get contracts to supply the Government with materials? These are interesting inquiries, which I would like to have answered by those who are undertaking to embark this nation in an era of militarism similar to that of the European nations now at war.

It has been claimed that to be prepared for war will insure peace. It has been claimed that the expenditure of enormous sums of the people's money in preparing for war will insure peace. But it is a singular fact that all the nations of the world which have expended more money for military and naval purposes than the United States are now at war. Only one nation expends more money upon her navy than the United States. Only five nations expend more money upon their armies than the United States in times of peace. Yet, that expenditure was not able to keep them out of the greatest war of all history.

I hope the day will never come when this peace-loving, God-fearing, prosperous Nation will pattern after the military nations of Europe. Already, about 70 per cent of the ordinary revenues of the Government goes to pay for wars we have had and those that may come in the future. What must be the prospect if we are to enter upon a field where we shall undertake to keep pace with the military despotism of the Old World? We are not a warlike people, though we are swift to defend our national and individual rights whenever they are trampled upon. And as we have been able in the past to defend ourselves with honor and success when we have been attacked, without becoming a great military power and warlike nation, always suspecting the motives of others, I have sufficient faith in the patriotism and devotion of the people to the principles of this Nation to believe we can do so again if occasion should arise. [Applause.]

It is not true, Mr. Chairman, that preparation to fight will keep a nation from having to fight more certainly than it will keep an individual from having to fight. Most of the nations of Europe were prepared to fight, and it has been said by many statesmen and thinkers that the real cause of the present European war was military efficiency. If a man starts down the street ready to fight, because he is prepared to fight, he is more than apt to have an encounter before he returns home. We usually do the things we prepare to do. This is true of nations as it is of individuals. The only hopeful sign connected with the present European war is the fact that each nation is trying to unload the responsibility for starting it upon the others. They are all ashamed of it. [Applause.]

Therefore, let us not become excited because half the world is at war. There is no European nation which desires to have a war with us. When they get through with the one they have on their hands over there, they will not be ready for the war business for several years to come. If the thing continues much longer, they will all be bankrupt, their armies destroyed, their battleships all sunk, their commerce gone, and the cry of the widow and the orphan will be heard for many years. Let us, therefore, bend our energies toward the accomplishment of peace. Let us make such sacrifices as may be necessary to adjust ourselves calmly to the agitated condition of the world and await the coming of the day when our voice may be heard around the world in the cause of peace and international righteousness.

I shall be a proud American, Mr. Chairman, if under the leadership of our great President, strengthened by the wise counsels of his great advisers, we shall escape the maelstrom of hate and murder now enveloping Europe, and in the end vindicate our mission as a Nation in upholding the principles of a just and free Government, placing the peace, the happiness, the prosperity, and the love and fellowship of the people above the imaginary glories of organized murder, masquerading in the name of war. [Applause.]

Rural Credits.

EXTENSION OF REMARKS
OF
HON. HORACE W. VAUGHAN,
OF TEXAS,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, March 2, 1915.

Mr. VAUGHAN. Mr. Speaker, I put some remarks in the RECORD on February 27 on the subject of providing credit facilities for the farmers. I do not wish to reiterate, but wish to say that while I favor legislation that will enable the farmers to organize cooperative credit associations in their respective communities throughout the country, and obtain such cooperation from the Government, under proper safeguards, as may be necessary to establish a credit system, adapted to the business of farming, that will furnish credit facilities for the man who has no land to mortgage as well as the man who has, I know that making provision whereby landowning farmers may, by mortgaging their land, obtain money at 5 per cent will do a great deal of good. It will lower the interest rate the farmers have to pay. It will enable many to save homes from foreclosure. It will enable many to acquire homes.

I voted for the McCumber amendment because it proposed that the Government make the loans direct to the farmers. Other bills and amendments proposed that the Government create and aid land banks to make loans to farmers. There is too much machinery about them. I prefer the direct to the indirect method. I voted to agree to the McCumber amendment without amendment because I did not wish to risk the chance of no legislation on account of disagreement over the matter between the House and the Senate. The McCumber amendment needs to be amended in a few particulars, but we could trust the next Congress to amend it rather than do so now under the circumstances of the situation. Some gentlemen talk with great vehemence against the Government lending money to the farmers, and, Cassandra-like, wail over the sad condition of the Republic that such a proposition is made. It is not proposed to give the farmers anything. It is simply proposed to use the credit of the Government in a safe and businesslike way to help reduce the exorbitant interest rate the farmers have to pay in many parts of the country; to lend them some of the Government's money as well as the banks; and the security required of them for the loan is as good as that required of the banks for the money the Government lends them.

Rural Credits.

EXTENSION OF REMARKS
OF
HON. J. M. C. SMITH,
OF MICHIGAN,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, March 2, 1915.

Mr. J. M. C. SMITH. Mr. Speaker, one of the most important bills that this Congress has been called to act upon is that providing for rural credits or farm-mortgage banks.

The purpose of the bill is to loan money to our farmers upon real-estate mortgages. There have been several bills introduced by different Members for this purpose, and testimony has been taken by the Banking and Currency Committee for over one year, but this committee failed to agree upon a bill or make a report on one to the House, so that it is up to this body to enact such a bill in a single day, and upon which only two hours have been set aside and allotted for general debate.

The subject of loaning money to the American farmer in aid of agriculture has been a topic of more or less discussion for a number of years, and in the year 1912 the Republican national convention adopted the following platform:

It is of great importance to the social and economic welfare of this country that its farmers have facilities for borrowing easily and cheaply the money they need to increase the productivity of their land. It is as important that financial machinery be provided to supply the demand of farmers for credit as it is that the banking and currency systems be reformed in the interest of general business. Therefore we recommend and urge an authoritative investigation of agricultural credit societies and corporations in other countries and the passage of State and Federal laws for the establishment and capable supervision of organizations having for another purpose the loaning of funds to farmers.

The Democrats at their Baltimore convention in 1912 adopted a platform for the investigation of the subject of rural credits, and while not going as far as the Republican Party in pledging itself to a policy for borrowing easily and cheaply money needed in farm productivity, went far enough to commit itself to the subject of rural credits and the loaning of money by national banks upon farm mortgages, and I herewith incorporate as a part of my remarks the Democratic platform upon that subject, which is as follows:

RURAL CREDITS.

Of equal importance with the question of currency reform is the question of rural credits or agricultural finance. Therefore we recommend that an investigation of agricultural credit societies in foreign countries be made, so that it may be ascertained whether a system of rural credits may be devised suitable to conditions in the United States; and we also favor legislation permitting national banks to loan a reasonable proportion of their funds on real estate security.

I wish to say, in the interest of agriculture, that it is the greatest industry in our country. It is known as the chief industry. It is before manufacture and transportation. One-third of our population, 30,000,000 people, are engaged in agricultural pursuits, while our whole Nation of 100,000,000 is dependent upon it. Our national wealth is estimated at $125,000,000,000, of which amount $40,000,000,000 is the estimated wealth of agriculture. It is stated in the latest census that the farmers who are engaged in the business of agriculture owe $6,000,000,000, so that we can at a glance see not only the importance but also the benefit of extending to the American farmer assistance in conducting and carrying on his farming operations and in making the burden of his indebtedness, if possible, lighter.

May I also state, possibly not as a premise to what I may say further on, that it is generally understood and claimed that farming at the present day is lucrative and profitable. It is possibly no more prosperous than any other business at the present time.

It is authoritatively stated that the net income on farm property in the four great agricultural States of Ohio, Illinois, Indiana, and Iowa was 4 per cent net upon the capital invested, which would be considered a very poor investment at the present time for any manufacturing industry.

It is frequently stated on the floor of the House that in many parts of the United States the rate of interest on farm mortgages is as high as 12 per cent, while in others it is very difficult to obtain a mortgage loan at all; and, as far as any bills I have been able to consider, rural credits limit loans to the proprietor or owner of farms at not to exceed one-half their actual value at a low rate of interest.

In my own State of Michigan it is not difficult to secure a loan upon a farm at one-half its value at the uniform rate of 6 per cent interest, while under rural credits it is supposed that the owner can secure a mortgage loan for 5 to 35 years at a rate of interest from 4 per cent to 5 per cent.

There have been two ways proposed to make it easy for the farmer to borrow money upon a real estate mortgage.

First. By a direct loan from the Government.

Second. By the Government guaranteeing the mortgage note or bond.

Around these two ways of aid from the Government all the other proposals may be centered, and I wish for a few minutes to call attention to the difference between them.

With all those who think that the Government should go into the loaning business and loan money direct upon farm mortgages and real estate I have no controversy. But my mind goes back to the formation of many companies and corporations for the specific purpose of foreclosing mortgages in an earlier day on Kansas and Nebraska farms where the money had been furnished by eastern capitalists. I have no controversy with those who believe that the Government should buy up all the railroads in the country, street car lines, electric light companies, telegraph and telephone companies, waterworks, and all other public utilities, including steamboat lines and railroad equipment, and issue bonds therefor, and then employ 10,000,000 people to operate them. But I do not believe the people are in favor of doing so just yet.

Some of the bills provide that money should be taken out of the Public Treasury and loaned directly to the farmer upon farm mortgages, and that the Government should sell the Panama Canal bonds, issue new bonds, or take the money in the postal savings banks for such purpose.

If the Government takes money out of the Public Treasury and loans it out on farm mortgages to the farmer, why not the Government take money out of the Public Treasury and loan it to the laboring man to assist in the purchase of his home?

I note fully that the Republican Party through its platform has recommended that a provision for loaning to farmers more easily and cheaply the money borrowed by them to increase the productivity of their land. But it says nothing about how this shall be brought about, and for a moment let us consider the second proposition of indorsing or securing the mortgage loan made to the farmer by the Government or State. This can be done without the Government furnishing the money. Two of the bills specifically provide a system which would afford the same relief as a loan from the Government without furnishing the money.

One bill provides for associations, small banks, and larger banks, for doing the business, and to which the farmer would go for his loan and to give his mortgage. When the application is made out and the loan is passed on by the association it is sent to the Government bank, or the State bank, together with the mortgage and the mortgage note or bond. If the loan is approved the Government bank, or State bank, retains the mortgage, and either guarantees the loan on the back of the note or bond given by the mortgagor, or issues a certificate guaranteeing the loan, which is sent back to the mortgagor and disposed of by him upon the market or to people wishing this kind of investment or the bank can purchase or sell it for him.

It is presumed that people having money to loan will prefer to loan it upon a certificate of indebtedness guaranteed by the Government or State than to loan it themselves upon the real estate and take the mortgage direct. It is claimed for this that the Government having a prior mortgage upon the real estate for double its value would never become a loser and would never be called upon to pay an obligation indorsed by it.

It is further claimed that people having money to loan prefer to loan upon some kind of a security guaranteed or issued by the Government or State rather than upon a real estate mortgage, although it is known that good real estate security is as sound as that so guaranteed. In fact, it is stated that in Germany and France at times these bonds or certificates, secured by real estate, have been known to sell on the market for a higher price than the Government bonds.

The subject is not without its intricacy and complexity, and possibly pervades some of the rules of taxation. Like all other questions of finance, however, it is also subject to well defined rules. But my observation with the questions of finance and of money is that they are not in trade and practice generally greatly affected by legislation.

Approximately one-half of the farms in the country are owned by people now living in town. This tends to build up a tenancy, and we hear more complaint about inability to secure farm labor than there is to secure money with which to conduct the farm. It is not encouraging for any man to recommend to his neighbor or anyone else to execute a mortgage upon his real estate if he don't have to. Mortgages are a mean

thing and are to be avoided if possible and hated rather than encouraged.

Certainly we all have the welfare of the farmer at heart. One would think from the remarks made here on the floor of the House that there is no one loved so much as he. Being a farmer myself I may speak with a little more freedom than license would otherwise permit. What I say may be accepted or rejected if it does not coincide with the experience of others.

The Republican national platform commits us to a rural farm credit. Sooner or later this legislation must be enacted into law. The choice may be between the two methods above referred to, and I concede to the man who thinks that the Government should loan its money directly to the farmer his right of opinion the same as I myself might prefer Government security instead of Government aid. The question being what is the best way to accomplish the result.

The subject is one of much interest. All the leading nations of Europe have a system of rural farm credits. A commission was sent from this country to Europe to study farm credits, and have reported in favor of establishing rural credits here, and if it will be productive of the good claimed for it the date ought not to be far distant when some system of establishing farm credits should be enacted into law.

Listening to some of our Members from the South, especially when the cotton bill was up, and hearing it frequently stated here on the floor of the House that the fall in price of cotton resulted in a great loss and created great distress similar to that of the Civil War; and that the high cost of living, which was the Democratic slogan during the last campaign, was soaring, all on account of the high price charged by the farmer for his product, and noticing the frequent editorials charging the farmer with unfair methods, my sympathy was much aroused.

But we must not pass a rural credit bill by which he can secure money that he does not want, merely because he can secure it cheaply.

There are many idle acres not being worked because no help or labor can be secured to work upon the farm. I would like to have some one of the committee explain whether or not the high cost of living is not more the result of not being able to get farm labor than it is to get money on a farm mortgage. It is not an uncommon sight to see gentleman from town riding past the fields in their automobiles while the farmers are either in the furrow or picking potato bugs to save his crop and to keep down the high cost of living.

The trouble with the Government going into the land-mortgage business, and purchasing these bonds direct either by investing the deposits of the Postal Savings Bank, selling Panama bonds, or purchasing each year mortgages direct out of money in the Treasury, are manifold. There is the paternalistic side of the precedent for the Government to go into other more hazardous business, especially if there is a depression.

Then, there will be the question of who comes first. In what section of the country will the Government loan its money? Will the Government buy or take all the mortgages now extant, should they be offered for sale? And ought the Government go into this business to the exclusion of furnishing money to conduct and carry on other business? And how are they to qualify these mortgages, or fix their value?

In determining the value of the security, some have taken the position that the security should be passed upon by a commission or an authorized commissioner in each locality who knows the market value of the land, and the mortgage taken for only one-half of what the land is worth. This is a restriction or limitation that prevents a great majority of farmers from getting any of the low-rate money upon a mortgage, as the value of a farm fluctuates largely with each man's opinion who is asked for one, and its value is not of a settled or fixed character.

In fact, a person having his farm half paid for is in fairly good circumstances, and can readily secure money in any locality at the current rate, and the only benefit a person would get from a long-time mortgage, or the only reason why he would mortgage his farm to the Government, would be the inducement of a low rate of interest.

Another proposed to fix the value of the farm according to its income. This method would be so entirely impractical as to be useless. The income of a farm is governed by the crop it raises. A crop of wheat might net $5 an acre, a crop of beans, potatoes, cabbage, or hay might net $10 an acre, while it would not be unusual for a crop of sugar beets and cotton to net $20 an acre. If the season is bad, the crops—either by too much rain or being too dry—are a failure, and the determination of the value by the income of the farm is too uncertain to form the basis for a commercial transaction.

But it is supposed that the farmer will be attracted by the long time in the mortgage for payment. Experience has rather proven that the person giving the mortgage upon his farm rarely ever wants it to run more than 5 years, and in this country it is very doubtful whether a mortgage drawn to run for a period of 10, 20, or 30 years would be acceptable by any of the investing American husbandmen.

It is proposed to make the mortgage exempt from taxation. Real estate mortgages do not pay any Federal taxes now, and some of the States in the Union, and the District of Columbia, have a law exempting mortgages from State, county, and local taxation. It would not be very polite of the Government to waive the taxes on property upon which it levies no taxes, and it would not be very courteous to the States for the Federal Government to destroy the authority of the State to levy taxes for its State, county, or municipal uses.

When the questions of national prohibition and woman suffrage were considered in the House, the great objection thereto by many of the Members was that it interfered with the rights of the States to pass their own laws affecting these subjects, and when it comes to the point of denying the States the right to tax mortgages upon real estate, undoubtedly much will be said about State rights, although we have heard very little upon the constitutional question in the consideration of this subject.

Hand in hand with the American farmer goes the interest of the American laborer, whose interest and welfare is as much entitled to consideration. What is done for him? Is his home, valued at $1,000 or $1,500, in which to support his family, to be taxed while the money of the investor is to escape taxation in mortgages? These are a few of the questions to be solved in determining the policy of rural credits.

I join with those who desire to aid the American farmer and the American laboring man to see our factories running and prosperity restored in every community throughout our Republic. But if the law to be enacted for this purpose is to be of the same effect as the law in Germany, France, and other foreign countries, and is to remain upon our statute books for all time, we should not only determine what is the best law for the purpose intended, but what law will best conserve the rights of all the people concerned.

Charges Against Judge Speer.

EXTENSION OF REMARKS

BY

HON. A. J. VOLSTEAD,

OF MINNESOTA,

IN THE HOUSE OF REPRESENTATIVES,

March 1, 1915.

Mr. VOLSTEAD. Mr. Speaker, it has not been my intention to say anything to this House in regard to Judge Speer or the charges made against him, but the gentleman from Georgia [Mr. EDWARDS] a few days ago took occasion to read into the RECORD those charges and a part of the majority report made by the subcommittee which investigated them. In view of this I desire to submit some observations, together with some excerpts from my minority report in answer and explanation. The subcommittee which made this investigation consisted of three members of the Judiciary Committee. All three agreed in reporting to the Judiciary Committee that the evidence did not sustain any of the charges. Upon this report the proceeding against Judge Speer was dismissed and all charges abandoned. Though the two majority members of the subcommittee admit that the evidence failed to establish any guilt, they nevertheless reflected upon the judge in a manner that seems to me very unjust. It was some of these reflections that the gentleman from Georgia saw fit to read into the RECORD. Let me call to the attention of this committee some of the facts that appeared in the investigation.

It may be conceded that there is considerable bitterness among a certain class of people in Georgia against Judge Speer. An attempt has been made to account for this bitterness by calling attention to the fact that he was appointed judge by a Republican President. While it is true that politics played an important part, party politics is only one element. The evidence taken on the charges bristles with facts that unmistakably point to matters less creditable than politics. The one thing above all others that stirred sentiment against Judge Speer is his conduct in trying peonage cases, and in this class of cases

may be included the so-called Jamison habeas corpus case. When he dared to hold the State statute void under which peonage is practiced in Georgia, including that barbarous State law under which petty offenders against city ordinances were sent to the State prison for six months at hard labor on the public road, he committed an unpardonable offense.

That peonage does exist in Georgia and that it is eagerly cherished by many people no one can doubt who has read the record in this case. Some time ago I received a newspaper from Georgia containing what purports to be an account of a speech delivered by Attorney General Felder, one of the witnesses against the judge. In that speech Mr. Felder appealed to the voters in behalf of his candidacy for the United States Senate on the ground that he is in favor of the repeal of the Federal peonage law. This issue could not be popular unless there is strong sympathy for this barbarous institution, which is worse than slavery.

The following from my minority report will give some idea of the manner in which peonage is carried on. The Crawly & McClellan case was one of the first peonage cases tried in the South. It had been carefully selected by the Attorney General of the United States after a report by a special examiner. In substance, the following evidence was submitted on the trial:

McClellan was the sheriff of Ware County and also jailer. Crawley was a lawyer. Henry Brunage and Dave Smith, two colored boys, were arrested and tried for stealing a watermelon and were convicted before the judge of the county court of Ware County and sentenced to imprisonment in Ware County, with no alternative of fine. Mr. E. J. McRee was asked to come for the boys by Crawley. McRee testified: "I received a letter from Mr. Crawley, which I can not find after a search, in which he asked me to come to Waycross; that there were some boys there who wanted to come to my place." McRee went to Waycross and, accompanied by Crawley and McClellan, went to the jail where the two boys were confined, and also found, outside of the jail, Jeff Brunage, a brother of one of the boys in jail. Jeff was not charged with any offense, but "was just out there interceding for them." McRee gave a check for these boys, the check being dated August 6, 1903, for $65, payable to the order of T. J. McClellan, payable at the Citizens' Bank of Valdosta, and indorsed by T. J. McClellan. This was to cover the fee of Mr. Crawley, the lawyer, and the jail fees of Mr. McClellan. Although in jail under commitment, and no provision made for release upon the payment of a fine, and no order of any court authorizing their release, the two boys were turned over to Mr. McRee, and not only were they carried to the plantation of the McRees, at Kinder Lou, but the little brother, who was "interceding for them," was also carried to the plantation, and E. J. McRee afterwards pleaded guilty to holding the three in peonage.

Another of the indictments charged a similar sale of Lula Frazier, who had been arrested for adultery, but on the hearing before the county judge he decided that if she was guilty at all it was of bigamy, of which offense his court did not have jurisdiction. While she was in jail with no charge against her, Mr. Crawley, her lawyer, telephoned to the McRees as follows: "E. J. McRee, Valdosta, Ga.: Come to Waycross for woman. W. F. Crawley." Mr. Frank McRee went to Waycross for her and was accompanied to the jail by Crawley and McClellan, the latter being the jailer. McRee gave a draft for $50 to Crawley, and the woman was released and carried to the Kinder Lou plantation in Lowndes County. This draft was dated August 27, 1902, payable to W. F. Crawley, for $50, drawn on the Citizens' Bank of Valdosta, and signed by Kinder Lou Mills, by F. I. McRee.

Other checks were tendered in evidence, in payment for other negroes, one for $88, payable to T. J. McClellan, for George Davis and Ed. Hardy, dated July 8, 1902. George Davis carried his wife with him to the Kinder Lou plantation. Another check, for $40, dated August 11, 1902, payable to T. J. McClellan, in payment for John Westley Brown. A third check was dated December 15, 1902, payable to T. J. McClellan, for $240, for "four men and one woman."

The two boys charged with stealing a watermelon were kept at McRee's for six months and 10 days each, and Lulu Frazier, the woman who had not been convicted of any offense, was kept there for 7 months.

The McRees at that time operated a large plantation in Lowndes County, about 70 miles from Waycross, where these parties were confined in jail. They also operated a large crate factory. About 200 hands were employed by them, many of them obtained in the manner above described. The negroes were worked under guard, locked up at night, whipped by overseers, and made to work out the money advanced to them. They were not permitted to leave the plantation. Some escaped and were captured; some made good their escape. The prison commission of Georgia made an investigation of the conditions at the McRee plantation a short time before these indictments were returned, and, as Mr. E. J. McRee stated, "did not exonerate us entirely."

The Branen case was another peonage case. It had also been selected by the Attorney General of the United States for prosecution. Parties interested in peonage contributed to the payment of Mr. Felder's fee; he was the attorney for the defense. After the defendant had been acquitted those interested in the defense arranged to have a barbecue to celebrate their victory. To this the jurors were invited. Complaint is made that the judge persuaded the jurors not to attend by publishing in one of the Macon papers a protest against the propriety of such action.

Branen, on being acquitted, went straight home and found a negro that had induced his sister, whom Branen held in peonage, to run away while the trial was going on. He went to a gathering of innocent negroes where the young negro was and arrested him, stating, "I will show you how to fool with my hands"; took him over to another county, in a graveyard, strapped him down to a log, and beat him to death; then tied a rope to his body, attached it to his buggy, and dragged it along the road to a conspicuous place as a warning to others. The judge simply sought to secure justice for these poor people, and as a consequence all the venum of race war was directed against him. The criticisms of his course are absolutely ridiculous.

The statute under which peonage is practiced in Georgia is almost identical with a like statute in Alabama. The Supreme Court of the United States has held this latter statute void, as in contravention of the Federal Constitution.

The so-called Jamison habeas corpus case illustrates a phase of the judge's character that was repeatedly emphasized in the hearings—his sympathy for the poor and oppressed—and is another of the chief grievances against him. It grew out of a statute under which the city recorder of Macon was authorized to summarily try offenders against the ordinances of the city without any written charge and without a jury, and impose upon the offenders a six months' State prison sentence at hard labor on the public roads.

The county of Bibb, in which the city of Macon is located, had entered into a contract with the city under which it was agreed that if those convicted by the city recorder were sentenced to the county chain gang (a part of the State prison system), the county would pay to the city $8,000 annually for the labor of these prisoners. A young man, as inhuman a wretch as ever disgraced a judicial position, was appointed city recorder of Macon a short time before this case arose. He promptly proceeded to fill the Bibb County chain gang. In the month of March, 1904, the month during which Mr. Jamison was sentenced, he sent 149 unfortunate victims to this chain gang.

Jamison, an inoffensive colored person, between 55 and 60 years of age, who had been engaged about town in odd jobs, like cleaning houses and laying carpets, was arrested, charged with being drunk. He was brought before the city recorder and promptly sentenced to the Bibb County chain gang for three months for drunkenness, and because while in this drunken condition he did not, while in the barracks, speak as politely to the officers in charge of him as they thought he ought to, he was sentenced to an additional four months for using abusive language, making in all seven months at hard labor in the State penitentiary.

Among those not blinded by any selfish interest in the $8,000 a year, there was naturally a good deal of hostility to the system and a good deal of sympathy for the unfortunate victim. While nearly all those sent to the chain gang were colored, occasionally a white person would be drafted in this fashion to do work. About this time a young white boy came to Macon to do some business. When this was finished, and on the same day, he repaired to one of the depots and bought his ticket to return home. The train was late; he sat down in the depot to wait and fell asleep. The train came and left without waking him. An industrious officer looking for a victim gathered him in, and the next morning, regardless of explanations and protests, the city recorder promptly railroaded him into the county chain gang, there to stay for several months. The charge against him was vagrancy. Public indignation, however, soon released him.

When Mr. Jamison was convicted Mrs. Speer's sympathies were aroused. She knew him; he had done some odd jobs at her home, and she called her husband's attention to the matter. This complaint was brought to the attention of the assistant district attorney, who presented to Judge Speer a petition for writ of habeas corpus. The writ was issued. Upon a hearing Judge Speer released Jamison on the ground that the statute authorizing the conviction was unconstitutional.

To give some idea of the character of this punishment and the motives that must have actuated him, I quote from Judge Speer's opinion in that case (130 Fed., 351):

The most cursory view of the evidence in the record will convince the impartial that practically every ignominious mark of infamous punishment is stamped upon the miserable throng in Bibb County chain gang. This is clear from the testimony of the superintendent, E. A. Wimbish, and from the uncontradicted evidence of witnesses who have there expiated their disregard of sundry provisions of the city code. The sufferers wear the typical striped clothing of the penitentiary convict. Iron manacles are riveted upon their legs. These can be removed only by the use of the cold chisel. The irons on each leg are connected by chains. The coarse stripes, thick with the dust and grime of long torrid days of a semitropical summer, or incrusted with the icy mud of winter, are their sleeping clothes when they throw themselves on their pallets of straw in the common stockades at night. They wake, toil, rest, eat, and sleep to the never-ceasing clanking of the manacles and chains of this involuntary slavery. They progress to and from their work in public, and from the public roads and before the public eye. About them as they sleep, journey, and labor, watch the convict guards, armed with rifle and shotgun. This is to at once make escape impossible and to make sure the swift thudding of the picks and the rapid flight of the shovels shall never cease. If the guards would hesitate to promptly kill one sentenced for petty violations of city law should he attempt to escape the evidence does not disclose the fact.

And the fact more baleful and more ignominious than all, with each gang stands the whipping boss, with the badge of his authority. This the evidence discloses to be a heavy leather strap about 2½ or 3 feet long with solid hand grasp and with broad, heavy, flexible lash. From the evidence, we may judge the agony inflicted by this implement of torture is not surpassed by the Russian knout, the synonym the world around for merciless corporal punishment. If we may also accept the uncontradicted evidence of the witnesses, it is true that on the Bibb County chain gang for no days is the strap wholly idle, and not infrequently it is fiercely active. One witness, who served many months testified that if the gang does not work like "fighting fire" (to use his simile) the whipping boss runs down the line striking with apparent indiscrimination the convicts as they bend to their tasks. Often the whipping is more prolonged and deliberate. At times, according to another witness, also uncontradicted, the convicts when at the stockade are called into the "dog lot." All present, the whipping boss selects the victim in his judgment worthy of punishment. They are called to the stable door, made to lie face downward across the sill, a strong convict holds down the head and shoulders, and the boss lays on the lash on the naked body until he thinks the sufferer has been whipped enough. It is but just to Mr. Wimbish to record his statement that he knew nothing of the ceremony.

It may be judged from the evidence that it is a whipping more formal and drastic than any other inflicted. Since this is done at the stockade, we may presume that the spectators and guards are the only witnesses, but on the public roads, in the presence of wayfarers and bystanders, often the convict, to use an expression of a witness, "is taken down and whipped." The evidence gives us the account of two white persons who were thus whipped, one a boy with but one arm. For this reason it was not necessary to hold him. He stood and cried as the boss applied the lash. The other white boy was compelled to place his head between the legs of a burly negro convict and was thus immovably held. The punishment will mark the lad with infamy in the minds of his fellows as long as he may live. The offense of one of these lads was "loitering in the depot."

At another point in this opinion will be found the following:

He [Jamison] applies for the great writ of right, the writ of habeas corpus, and he humbly seeks the portals of that court whose judges are sworn to know no difference between the rich and the poor, where justice ever bends the listening ear to catch the plaint of the humble and the lowly, and through all whose generous and benign jurisprudence is heeded the admonition of the Master: "Inasmuch as ye have done it to one of the least of these my brethren, ye have done it unto Me."

That the judge exhibited some interest in this unfortunate victim of a cruel system is now charged up against him, and this offense is greatly aggravated by the fact that his good wife asked him to do so. I wonder when it became an offense for a person on the bench to be actuated by motives and feelings such as those disclosed in this opinion? Is the inhumanity of the city recorder the sort of impartiality to be commended? I hope that our country may always have judges whose hearts beat in sympathy with the poor and oppressed. The Supreme Court of Georgia has, since this case was heard, held this statute void.

The action of Judge Speer in this case forced the city of Macon to have its charter so amended that the city recorder can not now send a person even to the city prison for more than 30 days instead of to the State prison for 6 months.

The famous Green and Gaynor case is another favorite topic in abusing the judge. These parties stole some $2,000,000 from the United States Government and spent it with the lavish hand of a drunken sailor in and about Savannah. They were highly in favor there, and when the judge, on a proper application, made an order excluding jurors from that town and the surrounding country from the trial panel he was condemned as a lawless tyrant. The case took three months to try. After conviction the case was appealed to the Circuit Court of Appeals and the Supreme Court of the United States and affirmed in both. The attorneys for the defendants—and they had an army of them—now swear at the judge with a vehemence that is amusing. They do not deny that their clients were guilty. Many phases of this same case have been before other courts, with the same results. The Government recovered some three-quarters of a million dollars in different civil suits subsequent to their conviction for the embezzlement.

The array of eminent counsel engaged in some of these peonage cases testifies to the supreme importance attached to the issue. The bitterness shown by the parties interested in these cases is simply amazing to a person not familiar with the situation. When you eliminate from the evidence taken to sustain the charges against Judge Speer the evidence in the Jamison case, the peonage cases, and the Green and Gaynor case you have eliminated the bulk of the evidence against him. When you understand the situation it is easy to explain why these parties criticize the judge; but there is another phase of this matter that should not be overlooked and no one can miss it in reading the evidence. Look at this list of corporation counsel who appeared as witnesses:

A. R. Lawton, vice president and general counsel, Central of Georgia Railway Co.

P. W. Meldrim, division counsel, Atlantic Coast Line Railroad Co.

Stanley S. Bennett, division counsel, Atlantic Coast Line Railroad Co.; general counsel, South Georgia Railroad.

L. W. Lambdin, division counsel, Atlantic Coast Line Railroad Co.

John W. Bennett, division counsel, Atlantic Coast Line Railroad Co.

Alexander Akerman, special counsel, Atlantic Coast Line Railroad Co., and assistant general counsel, Macon, Dublin & Savannah Railroad (controlled by Seaboard Air Line Railroad).

Minter Wimberly, general counsel, Macon, Dublin & Savannah Railroad.

W. A. Harris, division counsel, Southern Railway Co.; division counsel, South Central Railroad.

George S. Jones, counsel, Georgia Railroad and Louisville & Nashville Railroad.

A. A. Lawrence, counsel, Southern Railway Co. and Street Railways of Savannah.

W. W. Osborne, counsel, Southern Railway Co. and Street Railways of Savannah.

W. C. Snodgrass, president, Blakely Southern Railroad, connecting with Central of Georgia and Atlantic Coast Line Railroads.

Boling Whitfield, division counsel, Atlanta, Birmingham & Atlantic Railroad Co.

S. B. Adams, counsel, Merchants & Miners' Transportation Co., Naval Stores Trust, and other corporations.

J. R. L. Smith, president, Floville & Indian Springs Railroad, short line connecting with Southern Railroad.

W. E. Simmons, attorney for the Corbin Banking Co. and other corporations.

Why are these witnesses opposed to the judge? The reason is at hand: In the Rankin against Louisville & Nashville Railway Co. case, the United States against The Atlantic Coast Line case, the Central Railway Co. case, the McReynolds against City & Suburban Railway Co. case, the Holst against Savannah Electric Co. case, the Tifft against Southern Railway Co. case, the Johnson against Southern Railway Co. case, and other cases, complaints are made on behalf of these corporations by their attorneys. In every case it is apparent the judge strove to do justice. The complaint of W. E. Simmons is another illustration. As attorney for the Corbin Banking Co., a firm famous for its usurious exactions, he was not looking for justice; that was the last thing his client wanted. Judge Speer tried to give him what he was honestly entitled to, and he fled from his court and has not quit cussing the judge even unto this day, though that was more than a score of years ago.

It may be easily guessed that the judge's record on labor and trust questions is not very enthusiastically approved by these men. In Waterhouse *v.* Comer (55 Fed., 148) Judge Speer, for the first time in the history of our jurisprudence, recognized the right of labor organizations. His opinion in that case was printed as a Senate document. In the case of Farmers' Loan & Trust Co. *v.* Central of Georgia (166 Fed., 333) the receiver of that railway had without just cause discharged a conductor from employment on the road. The conductor appealed to Judge Speer's court for relief. Over the vigorous protest of Mr. Lawton, one of these railway attorneys, now a witness against the judge, he reinstated the conductor and condemned the unfair practice of the receiver. In the Erie Lumber Co. case (150 Fed., p. 807) will be found another opinion of Judge Speer of inestimable value to labor in protecting wages. Mr. George L. Jones, another railway attorney who testified against Judge Speer, opposed this view of the law. Shortly after the Federal employers' liability act was passed it came before Judge Speer. It was attacked as unconstitutional by this same Mr. Lawton. Judge Speer, however, not only sustained its constitutionality but commented it in vigorous language. With such a record it is not surprising that some years ago Grand Chief Engineer P. M. Arthur and Assistant Chief A. B. Youngson, acting for the brotherhood, strongly commended the judge for promotion to the circuit court of appeals. But these are not all the grievances corporation counsel have against Judge Speer. In the Naval Stores case (reported in 151 Fed., 834) this trust was indicted and convicted. It was claimed upon the trial that under the operation of this trust the people of southern Georgia had been robbed of more than $40,000,000. Mr. Adams, a railway attorney and witness against the judge, strove to avert this conviction. In the case of United States *v.* Merchants & Miners' Transportation Co. (187 Fed., 355) rebates were given in violation of the interstate-commerce law. The company was convicted and fined $30,000. This same Mr. Adams was again of counsel for the accused. In United States *v.* Miller (187 Fed., 355) Mr. Miller, who was the beneficiary of the rebates, was fined $5,000. Messrs. Osborne & Lawrence, who testified with

exceeding bitterness, were of counsel for the accused. In the case of Tifft et al. (123 Fed., 789, and 138 Fed., 753) Judge Speer enjoined the exactions of excessive rates on lumber, and by final decree compelled the repayment of more than $2,000,000 to shippers. The same Mr. Lawton was of counsel in opposition to this decree, which was affirmed in Two hundred and sixth United States, page 428. This case affected every railroad represented by the attorneys who testified against the judge. Osborne, Lawrence, and Meldrim were all of counsel in the famous Green and Gaynor case.

Is it not strange that none but disappointed attorneys and their clients should have been called in this inquiry? Why, that is what they are, with hardly a single exception. If the attorneys or parties who appeared on the other side in these suits or proceedings had been called, is there any doubt that their testimony would have been favorable to the judge? The fact that this testimony was not produced is almost as conclusive on that point as anything can be. Every piece of gossip from almost before the war down to the last edition of some newspaper that did not get the last bankruptcy notice to publish was dragged into this hearing.

It is perfectly evident that there is a motive behind this proceeding that does not rest on the highest order of disinterested patriotism. After these charges had been made against the judge the Valdosta Times, on December 21, 1912, edited by Mr. C. C. Brantley, now editor of the Macon Telegraph, published the following editorial:

A FIGHT ON JUDGE SPEER.

The grand jury of the United States court concluded its work in Valdosta yesterday by passing some resolutions putting itself on record as being opposed to the proposition to emasculate the southern district of Georgia and the creation of another division. It is generally understood that this movement was started for the purpose of trying to get rid of Judge Emory Speer, and that it is backed up by some men who are antagonistic to Judge Speer because of the fact that he does not look with any degree of allowance upon the misdeeds of the high any more than he does on the wrongdoings of the humble.

Judge Speer, though affiliated with the Republican Party, is a judge of the strongest democratic tendencies and spirit. He nearly always takes sides with the weak against the strong. The men who have been in his court have been impressed with the fact that humble offenders are shown the greatest consideration by him. He bas adopted a system of handling cases against moonshiners that has had a splendid effect, though he has not had to impose any severe penalties upon them.

Several years ago, when Judge Speer wanted to try the Green and Gaynor case, he went away from the scene of their operation and influence to get a jury to try them. It is said that they had strong friends who wanted them tried by a jury nearer home, believing that they would gain much in that way.

Later on Judge Speer had a round with the Naval Stores Trust, which was composed of large influences in and around Savannah, and it is said that these influences have been busy ever since trying to get rid of him. They are supported, of course, by the friends of the other culprits who have had to suffer because of Judge Speer's strong stand against "crime in high places."

The Times believes that the grand jury on yesterday expressed the sentiments of a large majority of the people of south Georgia in protesting against the proposition to tear up the southern district and to remove Judge Speer from the place which he now occupies with so much firmness, yet tenderness, in dealing with criminals of all types.

The resolutions which were adopted yesterday are printed in this issue of the Times, and we commend them and the spirit behind them to our readers.

Has not the hostility shown upon this hearing been nursed into being, in the hope that a Democratic House and Senate would remove Judge Speer, so that he might be replaced by some one subservient to the interests hostile to him?

As late as May, 1913, Mr. Akerman, the district attorney and one of the judge's bitterest enemies, expressed the highest regard for the judge. In 1910 the Bar Association of Macon tendered to Judge Speer a banquet on the twenty-fifth anniversary of his appointment as judge. At this, which was largely attended by the bar of the district, the kindliest feeling toward the judge appears to have existed, as is evidenced by the newspaper accounts of the occurrence. He was eulogized in the most flattering manner. This would clearly demonstrate that less than four years ago public sentiment was friendly to him. Five years earlier the bar association at Macon passed resolutions commending the judge. In these resolutions they emphasize by inserting as the first resolve:

That in the decision of cases in his court he has known neither the rich nor the poor, and that in the enforcement of the criminal laws he has tempered justice with that mercy which blesses him that gives and him that receives.

The Chamber of Commerce of Macon at this time, by resolutions presented to him, offered this tribute:

We recall with a great deal of pleasure—

First. That it was he who reorganized the jury system in these courts and eliminated the professional and unworthy jurors.

Second. Through his administration the criminal laws of the United States have come to be respected by all classes in this jurisdiction and justice is done to the mightiest as well as to the lowliest lawbreaker. The reform wrought by Judge Speer by crushing the great system of land piracy which once cursed this State has done a great deal to encourage immigration into Georgia and facilitates the work of the chambers of commerce and other commercial organizations in bringing investments into this section.

Third. We appreciate the fact that his great power, used as it has been used, has proven a protection for the State against men of enormous wealth and influence who have at times sought to increase their riches through crimes of the greatest magnitude.

Fourth. We are especially appreciative of the fact that the court has from time to time, on proper pleadings, taken charge of insolvent corporations involving great values, and through the skillful selection of receivers and by constant guidance brought about a reorganization of the properties and a restoration of their values, thus preventing untold losses in the community.

Fifth. We note with considerable pleasure the fact that in the administration of the bankruptcy law the records of the Attorney General's office show that in Judge Speer's district there is a maximum of net assets, homestead exemptions, priorities paid, and dividends distributed, while the same records show a minimum of cost of administration comparing most favorably with any district in the Southern States and with any district in the United States.

Sixth. It is also with pride that the people of Macon recall that within his 20 years on the bench Judge Speer has been reversed for his rulings in only one jury trial, and that in a large majority of the appeals in cases of all classes his decisions have received the approval of the Supreme Court of the United States and of the circuit court of appeals; and we find among his most ardent admirers the highest representatives of labor on one side and of capital on the other.

In 1906, at a banquet tendered Judge Speer at Savannah, Judge Carlton (now and for a long time judge of the superior court in that city) paid to Judge Speer an eloquent tribute. I copy from this the following:

And throughout the vicissitudes of his career—as soldier, as politician, as lawyer, as judge—he has loved his State and her people with a tenderness which is as pronounced to-day as it was when as a boy he took his chances, for their sakes and their honor, in the fighting line. His broad culture, his signal ability, the delightful humor which oozes from him as did Greek from Gladstone, his grace of oratory, are all known to you. But greater than these—perhaps the greatest dignity which can come to a man—is the humanity which has marked his judicial career.

There is no court in the land where the administration of justice is characterized by more dignity, and there is no court wherein the humble and the helpless are safer. The far-reaching effect of the Jamison case has not only struck a decisive blow at the unmerciful dispensation of unregulated justice—it has brought its administration by subordinate tribunals to a sense of proportion and laid upon them the humanizing touch which brings consideration for the casual errors of the weak and the poor and the friendless, and this is the straight path to the highest civilization it is given us to reach.

It is a signal tribute to his administration of his high office that while in this district population has increased and human frailties are the same, there is less crime than when he came upon the bench and fewer Georgians in Federal prisons.

Because of all these things, because of any of them, may time so lightly touch his heart that as the richly laden years shall pass along content shall follow in their wake, and friends be near, and hope and fame and peace.

In 1903 Judge Speer was a candidate for promotion to the circuit court of appeals. At that time he received the indorsement of nearly all of those who testified against him at this hearing. Some of these indorsements are significant. The one from the Savannah bar, which bears the signature of Meldrim, Osborne, Lawrence, Lawton, Cunningham, Saussy, Gazan, and many others, contains this language:

The long and faithful service of Judge Speer on the bench of the district court, during which time questions of the utmost moment have been settled by him with unusual ability, indicates him as preeminently fitted for the new honor with which his name is now associated.

During his administration this community has not only benefited by the singular ability and clear thought which he has brought to bear upon the issues which have been submitted to him, but our observation justifies us in declaring him one of the most humane of judges. During his term not only has crime diminished, but his eloquent charges to the juries impaneled in his court have done more than any other influence to make the people of Georgia feel that the Federal court is one of their own institutions.

The variety of novel points which have arisen in the cases tried by him, many until then undetermined, have demanded an acuteness of intellect and patience of research rarely exacted in the judicial career of any judge. His success in this direction, illustrating his preeminent fitness for the bench of the circuit court, is of record in the published reports. The daily evidences of usefulness to the public and consideration for the misguided and helpless are matters to which it is just that we should invite your attention, since they appear only inferentially in the plain statement of judgments.

The business men of Savannah furnished this tribute:

During his long service as the judge of this district the proceedings of his court have been marked with a dignity which has commanded respect, and his firm and humane dispensation of the law has at once diminished crime and tempered its consequences to the ignorant and the lowly. His quick and clear apprehension of the intricate constitutional and commercial questions which have been constantly submitted for his adjudication has invited the confidence of the business public, and the patriotic utterances, expressed with a singular and forceful eloquence, with which from time to time he has recalled to the people of this State the great principles which underlie the Republic, have had an influence for good, far-reaching and permanent.

The Augusta bar expressed this opinion:

We desire to bear testimony to Judge Speer's great learning, scholarship, and distinguished ability. As a judge his greatest characteristic is perhaps his love for substantial justice and equity. It is a common saying among the profession in the southern district of Georgia that

no innocent man is ever convicted in his court, and the guilty rarely escape. The lawyer with a meritorious cause does not hesitate to enter his court, while those with bad causes are usually wise to avoid them.

The business men of Augusta testified:

We have known Judge Speer personally for many years. He is a man of unquestioned ability, absolute fairness and impartiality, and has always undertaken to conserve the interests and rights of persons and property when they have been committed to his care.

Like indorsements came from his own town, Macon, and from other places in his district. In addition to this, he was indorsed by the city of Atlanta, not in his district, and by a great many public men in different sections of the country. It is significant that nearly all the complaints now presented were then known to the men who now so bitterly condemn him. That the judge has at all times been very humane and has striven earnestly to preserve the rights of the poor and oppressed as against the rich and powerful stands out prominently throughout this record. It is one of the things that appealed to those who signed these indorsements. It is the one thing for which he has been most severely criticised in this inquiry. Still there is no showing that any injustice has been done to anyone. In Georgia a judge of a State court can not comment upon the testimony in charging a jury, while under the Federal practice it is the duty of the judge to aid the jury by summing up the evidence, just as is done in the State courts of my State and in a great many other States. Against this Federal practice, which has aided in sending rich clients of those who complain to jail, there is vigorous protest. Lawrence, speaking of the judge, gives vent to this complaint:

He should never have been a judge; he has not got the judicial temperament; he has not got the judicial mind; he has not got the judicial character. I believe if he had remained at the bar he would have made one of the greatest advocates that ever lived, because he is talented in that line, and talented as I have never seen anybody else. He is the best cross-examiner of a witness I have ever known; he knows the jury, knows how to play on their passions, on their prejudices, as no living man that I have seen could do it; he has a faculty for marshaling evidence that I have ever seen another living man able to marshal; and in that Green and Gaynor case he charged that jury for eight hours, and I will challenge any six prosecuting attorneys in the United States, from the Attorney General down, all of them together, to take that mass of testimony taking three months' time that Judge Speer heard, and then put it down in as ingenious an argument against the defense as Judge Speer put it in that thing. It was a masterpiece of oratory, but a very poor thing when you come down to look at it from a judicial standpoint.

Despite this condemnation the circuit court of appeals and the Supreme Court approved the charge. I have had some experience in practicing law under both systems, and have no hesitation in indorsing the Federal practice in preference to that which prevails in the State courts of Georgia. I have never heard anyone but a lawyer complain because the judge in charging the jury in a Federal court is required to point out the questions to be decided by the jury and call attention to the evidence that has a bearing on those questions. That this practice greatly assists the jury in arriving at a just verdict no one can doubt. Under its restraining influence lawyers find it to their advantage to try cases fairly. They know that any appeal to passion or prejudice or appeals to misleading or irrelevant matters may be promptly rebuked in the court's charge. They find it necessary to appeal not only to the jury but also to the judge. It takes 13 men to steal a man's home in the Federal courts, while it may take only 12 under such a practice as that which prevails in the State courts of Georgia. The Federal practice is the old English practice, and it can not be said that it invades the province of the jury, as that institution was handed down to us. The Georgia practice gives a lawyer of superior ability a great advantage over his less fortunate competitor, but that advantage is at the expense of justice.

When it is remembered that none but men with a grievance were sought in this investigation, it is surprising that the record does contain some very striking indorsements.

Mr. Preston, one of the oldest attorneys at the Macon bar, testified that in some respects Judge Speer was the finest presiding officer he had ever seen. He added that the judge's exalted intellect and his splendid manner on the bench always impressed him. Judge Nottingham, speaking of the judge, said:

I have shot off my mouth about the judge, as all lawyers do. That is one of the usual things in the profession. It soothes our clients. When I came to Macon in 1888 to practice law, Judge Speer had been on the bench for two or three years perhaps. I found nearly every member of the bar criticizing him. The burden of the cry was, "Damn Republican. We want a Democratic judge sent in to help the party in north Georgia." I found the feeling pretty bitter even when I undertook to be his master in chancery. But the judge gained in popularity, and in less than two years, when Mr. Lamar died on the bench, I took a petition around for him and got all but 15 of the 45 members of the bar to sign it.

In regard to the charges of favoritism and antipathy to certain lawyers, I have never encountered any trouble of that sort. In the 40 years I have practiced at the bar, I have heard just as grave charges against the judges of the superior bench of this county. I have heard them charged with favoritism. Even dear old Barnard Hill, it was charged, had a school of favoritism in Anderson, Hill & Harris, and he was even insulted in open court as being a member of that firm. You could meet one man and he would tell you Judge Speer was unjust, unfair, and tyrannical. Of course he has made strong friends and bitter enemies, as every man with a strong personality must.

Minter Wimberley, speaking of Judge Speer, said:

When Judge Speer was appointed judge of this court, he cleared out the Augean stables. If there ever was a court that was a den of infamy, it was the Federal court of this district at that time, in my opinion When Judge Speer did clean out this court, I felt the deepest gratitude to the judge as a citizen and as a patriot, if I may be permitted to class myself as such. Judge Speer did me once a personal favor, and I never forget a personal favor. I took the first petition around Macon. I wrote it myself in the effort to put him on the Supreme bench of the United States. The feeling against him in some quarters was very intense; that was 15 or 20 years ago. I have known Judge Speer to do a great many beautiful acts of mercy to the oppressed.

Speaking of the judge's conduct in the Jamison case, Mr. Wimberley said:

I do not want to use the witness stand as a way to punish him for a fancied wrong. He thought he did me right; I thought he did me wrong.

At another point in the evidence he said:

The judge has been exceedingly kind to me and maybe in other cases he has not, and I did not expect him to be any kinder to me than to anybody else, but at no time did I think he did the other side an injustice when he decided in my favor.

Then again:

Except in the Jamison case—I am speaking for myself—I got fair and just treatment, and I do not know of my own personal knowledge of any other case in which I can say he did anybody any injustice.

Mr. J. R. L. Smith, who is very hostile to the judge, was asked on cross-examination, "Can you recall and cite a single judicial opinion of Judge Speer in which any human right or any Federal statute was violated or any right either of person or property denied to anyone?" To this he answered, "Not at this time." Mr. Toomer gave this opinion of the judge:

I have, while I have heard some slight testimony to the contrary, always had the impression that Judge Speer was a very hard worker. He certainly worked out very promptly and thoroughly every case that I ever had any personal knowledge of when I was representing the Government, as I have done in a number of cases, or the defendants, or in civil cases; I think that the judge is a judge of commanding capacity. I think that his capacity as a lawyer and as a literary man as well is simply superb.

I have never been able to convince myself, after 20 years of my knowledge—and he has never done me a financial favor in his life—I have never been the recipient of an appointment that meant one dollar to me, from him; I have tried cases that I lost in his court, but I have never been able to think that Judge Speer was not personally honest and judicially honest. I will go further and say this, that while there are some men—we all have our peculiarities—I know some very distinguished members of this bar who have grievances of manners, and this and that and the other kind, against Judge Speer, my own opinion is that the rank and file of the plain people and business men of this district find in Judge Speer and in his court a perfect terror to evildoers, not because of the severity of the sentence he is going to impose, but because of the certainty of their conviction in his court.

Since the hearing was held in Georgia, I have received a large number of letters and affidavits from lawyers, bankers, and business men residing in different sections of Judge Speer's district commending the judge in the strongest terms, and he has since been reelected dean of the law school of Mercer University. The jurors attending the various divisions of Judge Speer's district in 1913 protested against the project of dividing his district, and in that connection strongly indorsed Judge Speer, showing clearly not only friendly feeling toward him, but confidence in his ability and fairness as a judge.

While I concur in the recommendations made in the majority report that no further proceedings be had upon the charges against Judge Speer, I desire to express in as emphatic language as possible my protest against the methods that have been pursued; but I do not criticize the motives of my associates. In this investigation no effort was made to protect the judge against mere slander and abuse that could serve no other purpose than to disgrace and humiliate him. Every enemy that 29 years on the bench had produced was invited and eagerly encouraged to detail his grievance and to supplement that with all sorts of innuendoes, insinuations, and insulting opinions, utterly illegal as evidence and incompetent for any proper purpose.

It is humiliating to have to admit that a committee of Congress could consider such methods justifiable. No court in any civilized country would tolerate any such proceeding. The framers of our Constitution sought to give to the judges of our courts a position of security beyond the reach of passion and prejudice so that they might have the courage of their honest convictions. If judges are to be subjected to the treatment accorded Judge Speer, how can they be expected to maintain

that spirit of independence so essential to the just administration of the law?

It is not necessary to say anything in commendation of Judge Speer. The last line in the majority report, recommending no further action upon the charges, is, despite all criticism to the contrary, a complete vindication. It would not have been written if the evidence had pointed to anything worthy of real criticism. In conclusion, let me add, the day will come when Judge Speer will be remembered with pride by the people of Georgia, not only for his ability and integrity, but especially for what Mr. Wimberly called his many beautiful acts of mercy to the oppressed.

Standardization of Grain Grades and the Development of the Modern Grain Market.

SPEECH

OF

HON. GEORGE R. SMITH,

OF MINNESOTA,

IN THE HOUSE OF REPRESENTATIVES,

Monday, January 4, 1915.

The House in Committee of the Whole House on the state of the Union had under consideration the bill (H. R. 17971) for securing the uniform grading of grain, preventing deception in transactions in grain, and regulating traffic therein, and for other purposes.

Mr. SMITH of Minnesota. Mr. Speaker, I indorse all my colleague has said about the Minnesota Railroad and Warehouse Commission. It is natural that this commission should be opposed to any legislation that in any way interfered with its control over weighing and inspecting grain in the State of Minnesota; they have spent years of faithful service in perfecting a grain-inspection system that has no equal in the country, and they are justified in their belief that they can maintain this system in its present high state of efficiency better than an outsider having little, if any, practical knowledge of the subject. They are to be admired for their efforts to sustain an institution which has given such universal mutual satisfaction to both the producer and consumer of grain. I am satisfied that the people of the Northwest, and especially those of the State of Minnesota, would bitterly oppose a proposition to displace the railroad and warehouse commission system of grain inspection by any other system.

However, I am in favor of the pending measure, because, in my judgment, it will greatly extend the field of usefulness of this commission rather than in any way impair its present organization or its power to adopt and enforce its own rules and regulations.

In the different markets great lack of uniformity exists under the present system of grading grain, which causes considerable confusion to the grain trade and frequently causes injustice to buyer and seller. Each State or exchange fixes its own grades and can change them at will independent of any action taken by other States. In Minnesota there are 6 grades of wheat, while in Illinois there are about 25 grades, and like differences exist between other markets. Even where nominally the same grade exists the grades are differently applied in different markets. The present description of grain grades are too general in their terms permitting a variation in their application during the different conditions of the market and at the different State exchanges. Therefore, it is apparent that uniform grading or standardization of grades would be of great benefit to the grain trade. It would reduce the risk in buying and selling grain, thus enabling the dealer to handle it at a smaller margin and to get better results for the producer, and with uniform grades established, a grain grower or dealer in Iowa could ship to Minneapolis, Chicago, or St. Louis knowing that he would get the same grade in any of these markets: the one paying the highest price would get his shipment. Such a condition will tend to stimulate competition and materially benefit the producer.

The growth of the grain trade in the last 50 years, like nearly every other American enterprise, has been by leaps and bounds. In the early history of the production of grain the farmer carried his grain by team direct to the mill and sold it direct to the miller, who bought the grain by sample; that is, by inspection of the particular amount offered for sale. With the rapid growth of grain production, especially in the Northwest, it became necessary to remove vast quantities of grain to distant and seaboard markets, which necessitated the erection of large warehouses for storage of the grain awaiting further sale or exportation. As these practices developed it soon became impractical and exceedingly expensive to keep the grain for each sale and transaction separate. However, it was highly essential that the different qualities should not become intermixed or confused, as quality is a determining factor in price and a substitution of an inferior grade meant loss. Therefore, at an early date it became necessary to establish a system of grading or separation of the different qualities in a manner that would give mutual satisfaction to buyer and seller without the interference of partiality to either. In response to this demand the systems of grading have developed, and now, instead of receiving the identical grain brought in for sale, the buyer receives an elevator receipt calling for a definite amount of a specific quality or grade that he has purchased.

No step in the merchandising of grain means so much to the trade as an efficient, comprehensive grading system. To-day every produce exchange in the country, whether public or private, operates under a grading and weighing system. As early as 1885 the State of Minnesota created and established a grading and weighing department and lodged it under the control of a commission known as the Railroad and Warehouse Commission, where it has ever since remained. The Minnesota weighing and grading system has been adopted by Canada and several domestic exchanges and is to-day looked upon by the grain trade as one of the best systems in operation. About 250 men, under a chief inspector, are employed in the grading department of the State. These men are known as helpers, samplers, inspectors, graders, and clerks.

The method of weighing and grading under the Minnesota system is as follows: upon the arrival of a car of grain at a terminal market it is placed on a track reserved for inspection purposes. As soon as may be, a helper makes an inspection of the physical condition of the car and examines the seal, and makes a written report of the car's condition. A sampler then enters the car and takes samples from at least seven different places with a sectional probe long enough to penetrate to the bottom of the car. The sample thus taken is put into a small sack, together with a card on which is written the car number, the initial of the car, and the sampler's number. The sack is then brought to the office of the grader, who inspects the sample, gives it a grade, and enters the grade thus made in a grade record. He also makes out a slip showing the grade given the car and places it in a conspicuous place in his office, where it can readily be seen by anyone interested in the car either as buyer or seller. Under such a system as this it is impossible for the sampler or the grader to learn who the seller or buyer might be. Thus the possibility of playing favorites is entirely eliminated, since the weigher, the helper, the sampler, the grader, as well as the commission are all officials of the State. The commission, an elective body, appoints all employees. It is manifest that the whole weighing and grading system as organized and carried on gives to both buyer and seller efficient and impartial service. The State has no other interest except to see that the rights and interests of the parties engaged in the buying and selling of grain are protected by a disinterested board. Such a system has many advantages over a private system maintained by an exchange. Under the public system the weighers and inspectors occupy an absolutely neutral position, whereas in the private system they are apt to consider the interests of the party who employs them as against the interests of an outsider.

Federal supervision of State systems of grading and weighing, with grades established by the National Government, will be a vast improvement over any system we now have. Under the system in vogue in Minnesota the grades are established once a year by an appeal board, consisting of six members, appointed by the governor. Thus, it is seen that the railroad and warehouse commission's objection to the pending bill on the ground that they do not wish to have their work interfered with by the Federal Government for fear that the rules of grading that might be adopted will not be practicable or workable, does not seem to be well founded, because under the present system the appeal board of the State establishes the grades and not the commission; and is there any reason to believe that the commission will experience any more difficulty in operating under grades established by Federal authority than by State authority? It has been admitted by practically every witness who appeared before the congressional committee having charge of this bill that the standardization of grades by the Federal Government and the supervision of inspection would be beneficial to the grain trade, if practical. Moreover, they advanced no plausible reason why the Federal Government can not establish grading rules that will be as practical as those established by a State government. Likewise these witnesses admitted that if the Government officials whose duty it will be to establish these grades will call to their

aid men who have had practical experience in the grading of grain, they could see no reason why the grades established by the Federal Government with such assistance would not be as satisfactory and workable as other State grades.

Therefore, it is evident that the standardization of grades and the supervision of inspection by the Federal Government is both plausible and desirable from every point of view and that this legislation should be enacted into law without further delay.

MARKET PLACES.

Co-existent with the establishment of systems of both private and public warehouses for the housing and storage of the large surplus stock of grain, as well as the development of the systems of weighing, grading, and issuing of elevator receipts, scientific and efficient market places likewise developed, and to-day constitute the great centers in the commercial world. These market places, which, like the other steps in the grain trade, grew from small trade rooms where a few men met to buy and sell grain for immediate use, have become extensive and highly organized institutions known as exchanges.

The Minneapolis Chamber of Commerce, a type of the modern exchange, is the leading primary wheat market in the world. This institution is organized under a general statute of the State, which grants to the chamber the usual rights of holding property, organizing under its officers and under rules and by-laws adopted at will. In addition to the usual rights granted to organizations incorporated for commercial purposes, there is added to this class of associations an important provision giving them the right to establish an arbitration committee, as follows:

First. Said corporation may constitute and appoint committees of reference and arbitration and committees of board of appeal, who shall be governed by such rules, by-laws, and regulations as may be prescribed by said corporation, for the settlement of such matters of difference as may be voluntarily submitted for arbitration by members of said corporation or by other persons not members thereof. The acting chairman of either of the said committees or boards, when sitting as arbitrators, may administer oaths to the parties and witnesses, and, upon request of any party to such arbitration, any clerk of any court of record, on payment of his fees therefor, shall issue subpœnas for the attendance of witnesses and production of papers before said committees, and the same may be served and obedience thereto enforced in like manner as process requiring attendance before court issuing the same.

Further:

Said corporation may inflict fines upon any of its members and collect the same for breach of its rules, regulations, or by-laws. Said fines may be collected by action for debt before a justice of the peace, or in any court of record having jurisdiction of the amount of the fine, in the name of the corporation, or by temporary suspension or removal from the membership, or removal from office therein.

MEMBERSHIP.

The membership in all exchanges is limited; for example, the Minneapolis chamber's membership is 550. After that number is reached new members are admitted only by transfer of membership. Experience has shown that about 15 per cent of the total membership of the chamber changes each year.

The section of the by-laws regulating the admission of members to these associations are quite similar and are about as follows:

Any respectable person, on the proposal of one member, seconded by another, and on presentation of a certificate of membership duly assigned to him, and a written application stating the nature of his business, and such other facts as the board of managers may require, after a certain number of days' notice of such application has been conspicuously posted in the exchange, shall be admitted to membership, if approved by the committee on admissions and elected by the board of managers, on the signing of an agreement to abide by the charter, by-laws, and rules of the exchange and all amendments that may be made thereto.

One of the advantages for a limited membership is that it enables the board of directors to enforce the rules of the organization with little difficulty on account of the fear of the loss by the member of the privileges of the exchange, which are of greater value by reason of the fact that the membership is limited.

Every modern device tending to facilitate the gathering and dispatching of information will be found in the exchange room of an up-to-date market such as the Minneapolis Chamber of Commerce, with its well-equipped rooms suitable for the use to which they are put, with its blackboard recording complete statements of the supply of grain in store at the leading markets, and with the daily quotations of prices sent from all the leading markets instantaneously with any change in price. The objects and purposes of these associations, in addition to the supplying of these accommodations and facilities, are stated in the articles of incorporation as follows:

To inculcate just and equitable principles in trade; to establish and maintain uniformity in commercial usages; to acquire, preserve, and disseminate valuable information; to adjust controversies and misunderstandings between persons engaged in business, etc.

COMMISSIONS.

The Minneapolis chamber, like all other chambers, by rule fixes a definite rate of commission to be charged for the purchase and sale of grain. Much criticism has been leveled at this commission rule; however, no complaint has been made that the charges for the services rendered are either unfair or unreasonable. It is of vast importance to the shipper to know what commission he will have to pay; and since the shippers can not all appear in the market to sell their own grain, they must be represented by an agent, who is known as a commission broker; and this agent, if he is going to stay in the business, must make a charge; and it is much better for all parties concerned to have a reasonable fixed commission with uniform application than to have one that fluctuates from day to day.

In the merchandising of grain the commission merchant, in so far as the producer is concerned, performs the most important function. He must of necessity be an expert in the handling of grain so as to intelligently advise his client—the country shipper—of the market conditions as well as to match the skill of the buyer who is invariably an expert dealer. It is to the merchant's interest to secure the highest price for his customer's grain, since he has to depend on the country shipper for this business. A very close relation exists between the shipper and his broker on the exchange. It is no uncommon thing for these brokers to have and retain the same customers for years.

It requires three to four hundred millions of dollars to move the annual crop harvested in the Northwest, which places a great burden on the banks and grain traders of this section of the country. The country shipper looks to his broker to furnish him a portion of the money needed to carry on his business, and unless the broker is a man of considerable financial standing he will be unable to meet this demand made upon him by his customers. However, these demands have invariably been promptly met by the commission merchants of the chamber of commerce. All of which goes to show that a commission merchant must be a man of ability, integrity, and financial standing to operate upon the exchange and to hold the confidence and business of his customers.

SPECULATION.

The Minneapolis Chamber of Commerce has grown and developed in response to the desire and the need for a large, well-organized market that would take care of the surplus stock of grain. With the rapid development of the enormous agricultural areas, especially in the central and western portions of the United States, the supply in this section of the country far exceeded the local demand, and the necessity arose for the proper distribution of this surplus to the consuming markets of the world where it could be properly used.

In other words, there was an urgent need to find some organization that would introduce the northwestern producer into the world market, where his surplus grain could compete with the crops of other nations and other parts of the country. The commission broker still continued in his field of operations, acting as agent on the market for the country shipper, but in addition to these men there developed a class of persons who, instead of caring for the local needs of producer and miller, sought to introduce the surplus supply of the Northwest into the world's and distant markets for competition. The country shipper did not have adequate facilities, information, or finance to take the risks in this new field, and there soon sprang up a class of persons who entered this realm voluntarily, known as speculators. Speculation now has become an important economic feature in modern business; in fact, it is the very life, the vital part of our present exchanges and chambers of commerce. Speculation is not a creature of modern invention, but has existed as long as there has been trade of any kind; it is only since the eighteenth century that it has become highly organized in the routine of business to the extent of becoming an indispensable factor in economic production, and the modern speculative machinery is now one of the most important factors in determining price.

The word "speculation" connotes to the average mind such ideas as gambling; in fact, it is frequently thought of as a synonym for gambling. Naturally, such an interpretation and suggestion is extremely odious to the lay and professional mind, and a popular prejudice has arisen against anything connected with speculation, and especially against exchanges and chambers of commerce where such functions are carried on daily. This popular antipathy has been due largely to a lack of accurate knowledge and an understanding of the real significance of the terms. Especially is this true in respect to the terms "dealing in futures" and "hedging," terms of which few people, other than those actually engaged in the business, know the meaning, and they gather their ideas from the current reports

issued from time to time when evils have resulted from the practice and use of these usages of business.

It would be foolish to try absolutely to defend the methods and practices of speculation, "dealing in futures," "hedging," and "options," for it must be admitted that many evils have arisen through the use of these business usages and practices; but, on the other hand, it is equally true that a great amount of good is directly traceable to them, and moreover, such practices are, and no doubt always will be, vital factors in modern business. If this is true, then the important thing is to find out the exact nature of speculation, its legitimate functions, its use in the modern business world, and from these sources of information the question may be answered, "Is speculation a necessary part of the modern commercial machine?" Only after acquisition of such knowleuge, at least to a fair degree, will anyone be able to respond or answer to the spreading propaganda to wipe out all exchanges and chambers of commerce, which has started from the arousing of popular sentiment against these business machines. There has only been one real attempt to wipe out these exchanges and chambers—detailed information will be given later—and several attempts have been made in other countries with varying degrees of success to regulate, and in the United States several different schemes have been introduced into Congress only one of which was ever successful in passing even one branch of Congress.

Speculation is not gambling; in fact differs materially from it. In speculation the risk already exists, no chances are created, but are already in existence, just as in the case of fire insurance the danger of fire exists long before there is any policy and long before the creation and development of fire insurance companies. In the case of fires the assumption of the risk has been taken over by organizations known as insurance companies. They have really done nothing else than speculate as to the future and the possibility of destruction of property by fire or other causes. During the course of years and by experience this risk has been reduced as far as possible to an accurate scientific basis and the companies can determine the rates to very small margins of accurateness. The insurance business has developed a special class of men who have undertaken the assumption of the risk of future loss by fire, tornado, and so forth; they merely assumed risks already in existence, because the great majority of business men and property owners did not wish to carry this risk themselves. In gambling, an unnecessary element of risk is created.

A man bets on the outcome of a certain event, a race for example, and he puts up his money as to the outcome; the outcome of the event was uncertain, but there was no necessity for creating this risk of losing his money on the probable results. Gambling is needless, and the risks it creates are not helpful. But in speculation, as in insurance, the risk already exists. When the farmer harvests his grain and stores it in his granary, he is subject to the change in price of the commodity; in other words, he is speculating. He does not know the amount of the total crop; that is, the supply or the demand, and consequently he can not determine the price. The only reason that he holds his grain is to wait for a better price than the one obtainable at the time of harvest. Price is an uncertain thing which is bound to fluctuate, and with the fluctuation there is a chance of loss to the farmer. When he thus keeps his crop he is assuming the risk of change in the price of grain; if the market goes up he is the winner; if it goes down he is the loser. In either case there is the element of speculation with its ever-present risk. Although there are insurance companies that will insure products to be carried from one place to another, there are no companies that will insure the carrying of products from one time to another; but instead of the development of insurance companies there has grown up a special class of men who have been willing to take over the risk of the change in price. These men have made a special study of the risks involved in the carrying over of commodities from time to time, they have endeavored to lessen the field of chance, to discover methods of penetrating the future, and to anticipate events affecting price and the sale of commodities. In other words, speculation is nothing else than foresight, and the most successful speculator is the one with the keenest foresight and the best ability of effectuating and devising means for effectuating the ends in view.

It must be remembered that the annual crop of grain is not sent to the market in a steady stream throughout the year, but is suddenly dumped on the market soon after harvest. Somebody must carry the amount needed in future months, the surplus, and must assume the risk of the changes in price. It is in this field of business that the speculator has appeared, and to the best advantage. If, at the harvest time the exact crop could be determined and the demand accurately ascertained, then the crop could be distributed over the year and an ideal or theoretical price would result.

But the future is uncertain. Events may arise which will change the entire aspect of the market and the crop can never be accurately estimated. Fluctuation is inevitable, and the speculators assume the risk because of their knowledge of conditions throughout the whole world, made possible by the modern means of communication, and because they are educated and are competent financially of performing this service, which is analogous to insurance. The general effect of speculation, contrary to popular opinion, is to moderate these fluctuations in value and to maintain the price in the fall months, when the crop is suddenly thrown on the market, and when under ordinary economic conditions the price would fall to low levels, and, on the other hand, tends to prevent exaggerated prices in the summer, when the crop is becoming exhausted. The speculator, in other words, distributes the crop over the year, and thus tends to steady prices and to keep them close to the theoretical price.

The question might be raised, Why can not the farmer or the local elevator man do his own trading without resorting to this class of speculators? Theoretically there is nothing to prevent such action, but it is not to the advantage of the farmer to do so.

In this modern world of business, with its swift means of transportation and highly developed system of communication, the local conditions are not the controlling factors in price. The modern market is the whole world, and every country contributes to this market and to the determination of price. A poor crop in Russia increases the demand in some other locality, a bountiful crop in Argentina influences the markets here in this country, the whole world contributes to the supply of grain and consequently to the determination of price. With this greater complexity in the business world it has become more and more difficult to ascertain the supply of grain and to compute the theoretical price. The farmer has not the sources of information regarding the conditions of other countries or does not keep in touch with conditions in other parts of the world, and yet the world conditions are determining the prices and the changes in values. In order to facilitate the interchange of grain and to keep in constant touch with world conditions a class of persons, called speculators, who operate upon the exchange have arisen and they have assumed the risk of the fluctuations and the effect of future events upon the price.

Mr. Irving Fisher, professor of political economy at Yale, in commenting upon speculation, said:

> Business men try not only to estimate the risks they must encounter and to adjust their accounts accordingly, but they also endeavor to avoid such risks altogether. One method in which risks may be reduced is by throwing risks into the hands of a special class of speculators.
>
> Where risks can not be reduced to a statistical basis and therefore can not be insured against, recourse is often had to the shifting of the risk into the hands of those who are willing to take it. Such persons are speculators. A speculator is usually fitted for his work by special knowledge, so that the risk to him, owing to superior foresight, is at the outset less than it would be to others. The indiscriminate prejudices against all speculations which is so often met with is beside the point, for were there no speculators the same risks would have to be borne by those less fitted to bear them.
>
> Where speculation is based on independent knowledge its utility is enormous. It operates both to reduce risks by means of utilizing the special knowledge of speculators and also to shift risk from those who lack this knowledge to those who possess it. The consequence is that normally speculative property will gravitate into the hands of those most able to forecast its true income.

Prof. Seligman, a noted economist at Columbia University, says, in his Principles of Economics (1905):

> Speculation and the result of regular speculation is to steady prices. Speculation tends to equalize demand and supply, and by concentrating in the present the influences of the future it intensifies the normal factors and minimizes the market fluctuation.

"FUTURES."

A special form of speculation known as "dealing in futures," or simply "futures," has been the subject of the most extreme and adverse criticism. A "future," according to the use of the term in grain exchanges, is "the contract for the purchase and sale of grain to be delivered during some future months," usually the months of May, July, and September, or December. Any other months would be permissible, but these months have been determined by the movement of the crop.

A "future" does not call for a special or specific quantity of grain; it is merely a contract to deliver in the future a certain and specified amount. The man who sells may or may not have the grain in his possession at the time he makes the sale. The seller may think that the price will go down and that in the future he will be able to supply his contract by purchases made below his original contract sale. At the termination of his contract the seller is merely obligated to deliver the amount.

and he does this by delivering warehouse receipts on some licensed warehouse—that is, a warehouse which is recognized by the chamber as qualifying to the State regulations and doing business in a way satisfactory to the rules of the chamber. In Minneapolis, in all contracts for future delivery, it is understood that No. 1 northern wheat is to be supplied. The grades are determined not by the buyer or by the seller, but in Minnesota by a State inspection department which judges the quality and determines whether the grain is No. 1, or what it is. This grading process makes deals in "futures" possible, for a man may sell any amount of grain without actually at the time being in possession of the grain.

In the ordinary course of legitimate business there is an actual delivery contemplated by the party who sells to the party who buys. The party who buys does so because he knows that he will need grain along in May, or some other month in the future, for the purpose of carrying on his business, and he believes that the price at the time of this purchase is better than it will be in the future. For example, A knows that along in May he will need 50,000 bushels of wheat to carry on business for the rest of the year. He has not the storage capacity for keeping it from now until then, but he needs the wheat in May. He could wait until May and supply his need then at the prevailing market price; but he thinks that the present price and quotation on May wheat is better now than it will be along in May, so he contracts with some one, B, who is willing to supply A wheat in May. If the price goes down, A is the loser, and his profit is less than it would have been had he waited until May to buy his wheat. But B is the gainer, on the other hand, by the transaction. This is a simple illustration, and on the market the average dealings are far more complex; men are constantly selling and buying as the market varies from day to day as the report comes which they think will affect the future market.

"HEDGING."

In the business world futures are used as effective means of protection in the transaction and carrying on of the grain and milling business, and this protective application and appliance of futures in the legitimate business realm is known to the trade as hedging, which is really nothing less than insurance.

In many classes of produce and manufactured goods it is impossible for the owner of the articles to hedge and to protect himself from the fluctuations which might occur in the market, and there is no class of persons who will assume this risk for him; so, consequently, these products and manufactured articles must be "merchandised," that is, the owner, manufacturer, wholesaler, or retailer must assume this risk himself, with the result that he must take a large profit to justify the risk and to insure himself, for it is only in this way that these articles can be handled in safety, and only such articles of commerce as are not susceptible to speculative risk—as in the case of articles where the supply is always fairly constant and generally capable of accurate computation—can be handled on a narrow margin of profit.

A simple example of hedging will illustrate the effects of this feature of the market and the use to which it is put:

A farmers' elevator out in some small country town buys wheat from the farmers soon after harvest for cash and stores this wheat in his elevator. Most farmers do not like to keep their grain on hand in their own buildings when the market price is reasonable at the time of harvest, as the market is always uncertain, and they would sooner have the spot cash for their products and grain, and in some instances they need the spot cash. The elevator man as soon as he purchases the wheat assumes the risk of price fluctuation and a possible loss or profit. The market may go up soon after his purchase and the elevator man sees a chance to sell his wheat that he has purchased for a future delivery at a profit of a few cents—for example, 4 cents. He knows that there is a possibility for a further rise, but this possibility is uncertain, and rather than take the chance he shoves it off on the speculator and is satisfied with his 4-cent assured profit. The elevator man has hedged his wheat; or, in other words, he has given the risk over to a speculator.

If the contract made by the elevator man called for delivery in May and the elevator operator did not wish to keep the wheat on hand that long, it would be a very natural thing for him to ship his wheat to the terminal market in the fall, arriving along in November. If the price of wheat had advanced 5 cents, he could sell this wheat, and apparently would be making a profit of 5 cents per bushel; but he has his contract, or hedge, to supply, and if the current price has gone up 5 cents the May price will likewise go up correspondingly, and in order to buy back his hedge he will have to pay 5 cents more than the original purchase price called for; so he is still left only the original profit of 4 cents.

On the other hand, should the market decline 5 cents and the wheat was shipped in November to the terminal market and sold, the elevator operator would apparently lose 5 cents per bushel, but if the current price goes down 5 cents May prices would go down to the same extent, so he could buy back his hedge at a profit of 5 cents, thus offsetting his loss, with the ultimate result that he would still have the original profit of 4 cents as contemplated.

On the other hand, the miller may want to purchase wheat to cover up his sales of flour which he has made in advance, basing his prices of the sale on the current market. If the price of wheat should go down along in May he would reap a greater profit on the sale of his flour than he had contemplated; but if the price should rise he would be obliged to supply the contract calling for flour, and his profit would be wiped out. Therefore he will go on the market and hedge his flour sales for future delivery by buying wheat for future delivery. By so doing he loses all chance at the speculative profits; but he is willing to forego this chance and is satisfied by a small profit, because he has also insured himself against speculative losses.

In fact, therefore, hedging is an insurance against a real and ever-present hazard in business. Every leading grain exchange renders in this respect a function as legitimate and useful as our life and fire insurance companies, and, in fact, they should be regarded as among the greatest insurance interests in existence. Here is a type of insurance that is so dangerous that no private insurance company has ever wanted to underwrite it. A purchaser of large amounts of grain and cotton who does not enter the future market for hedging purposes speculates as really as if he purchased the "future" for purely speculative reasons.

In the cotton business the Liverpool banks refuse in some instances to lend money on cotton in the warehouses unless it is hedged, and if money is lent on cotton not hedged the interest rates are invariably higher. The reason is evident, as the risk of loss in the change of prices is done away with and the price is assured; consequently the banker can depend upon the return of his capital.

The use of futures for hedging purposes is clearly within the realm of legitimate business and is a real insurance and security to the grain and milling business, preventing speculative profits and also speculative losses.

On the other hand, there is a large field of operations in the future market carried on by persons who deal in futures with no bona fide purpose or intent ever to deliver or to secure delivery. They are constantly watching the market and conditions affecting it, buying and selling, and taking the profits expressed in the difference between purchase and selling price. Such selling and buying is bound to affect the market to some extent, and at times is effectual in producing serious fluctuations in the market prices. Persons doing business for differences only, those who play the market for what there is in it, are the ones who try to manipulate prices and reap the benefits of the change thus artificially produced. These classes of persons have been responsible for the extreme criticism leveled against the exchanges, but the persons criticizing usually fail to distinguish between legitimate speculation, which includes hedging, but classify all speculation as unworthy, producing bad effects upon the market, and artificially manipulating prices.

In order to avoid adverse popular criticism and to bring the exchanges wholly within the realm of legitimate business it is the present problem of these exchanges to rid themselves of the evils of wild speculation and manipulation. These are the problems confronting the chambers of commerce for solution.

The Minneapolis Chamber has put itself on record as desiring to—

make Minneapolis a safe place for hedging, a real grain exchange, and a safe market without the chance for manipulation and the opportunity to corner any grain, and has evidenced a bona fide intention to effectuate these results by the adoption of rules and regulations, a few of which are hereafter enumerated:

Resolved, That offers to buy or sell large quantities of grain or seed for future delivery, with limitation requiring the buyer or seller to purchase or sell the entire amount offered, is not permissible and is hereby forbidden. All such offers to buy or sell grain or seeds must be open for acceptance by any member in lots of 5,000 or multiples thereof.

The spirit of this order is that pit trading shall be open and free. This is directed against the possibility of manipulators who come in on the floor and offer to sell all or none below the market price or offering to buy all or none above the market price, thus causing an artificial or manipulated change in the market price. If any such offer were made on the Minneapolis Chamber floor, more than one person could buy or

accept the offer, which would result in a loss to the person without the desired change in the market.

Another rule looks toward the prevention of corners. It reads:

SECTION 1. In all sales of grain for future delivery the grades shall be No. 1 northern wheat, No. 3 corn * * *: *Provided*, That on all sales of wheat No. 2 northern wheat, as established by joint board of grain appeals or other properly constituted authority of the State of Minnesota, may be delivered and applied at a discount of 3½ cents per bushel below the price of No. 1 northern wheat.

A corner is only possible when some person has ample means to get control of the supply in that market. The smaller the supply the greater the possibility for getting control and, conversely, the larger the supply the more difficult. Now, if there are a large amount of contracts out for May delivery, any person who can get control of the May wheat can ask a prohibitive prices from those persons who are bound to deliver according to contract, and thus the price is sent way up. But by this rule the seller, if he can not get No. 1 wheat, has the option of supplying No. 2 at a rate 3½ cents less than the price for No. 1 northern. The actual difference in value between the two grades is less than 3½ cents, so that the seller would endeavor to supply the No. 1 northern as per contract. It is next to impossible for any person to get control of the supply of both grades, and thus the risk of corners is minimized.

Realizing the unproductive results of dealing in futures with no intention to deliver, but for the mere purpose of dabbling in the market, the chamber has passed the following resolution, which helps in a large measure to shut out such persons:

Resolved, That the making of pretended or fictitious offers to buy or sell futures in pit trading is uncommercial conduct, and is hereby forbidden.

The purpose is to put an end to all bids or offers which are not made in good faith and intended to be carried out if accepted.

The Minneapolis Chamber of Commerce has attempted to secure concerted action of all the exchanges to formulate rules and regulations which make it difficult for the incompetent person to deal or work on the market, and, if possible, adopt such rules as would make it impossible for these persons to engage in speculative trading. In other words, they are endeavoring to keep out the manipulator, the so-called "lambs," who are nothing less than inexperienced persons who dabble on the market and take what are known as "fliers" or chances on the market conditions, which usually result in loss—or, to use the exchange phrase, they are "shorn." It is a big problem to keep these persons out and at the same time to keep the market open to the small elevator man and the farmer and offer them the opportunities for legitimate hedging of small quantities of grain. The question presents difficulties and the Minneapolis Chamber has expressed itself as willing to help in any propaganda which will look toward the abolition of the abuses and evils of an exchange and which will recognize the benefits and help the legitimate field of operations.

Several countries have made efforts to control or regulate exchanges, and especially trading in "futures." France has the most complete system and exercises the greatest control. In that country there is an authorized exchange, and the Government appoints 60 brokers, who are permitted to operate on the market, and they alone are given the license to operate. The rules of the market are formulated by the Government and enforced by the governmental machinery. Time operations or dealing in futures are not permitted, and the Government provides that all contracts for time operations shall be null and void. The markets have been greatly hampered in their work and the results are far from satisfactory, and would probably be entirely unworkable here in our larger exchanges.

In England several different methods of legislating against speculating had been tried and after six centuries of unsatisfactory legislation a commission was appointed to "inquire into the origin, objects, present constitution, customs, and usages of the London Stock Exchange." The report of this commission was published in the parliamentary bluebook (1878).

The commission reported:

In the main the existence of the stock exchange and the coercive action of the rules which it enforces upon the transaction of business and upon the conduct of its members have been salutary to the interests of the public. We wish to express our conviction that any external control which might be introduced by such a change should be exercised with a sparing hand. The existing body of rules and regulations have been formed with much care and are the result of long experience and vigilant attention of a body of persons intimately acquainted with the needs and exigencies of the community for whom they have legislated. Any attempt to reduce this rule to the limits of the ordinary laws of the land or to abolish all checks and safeguards not to be found in that law would, in our opinion, be detrimental to the honest and efficient control of business.

The report goes on further to absolutely uphold the purpose of the exchange and the legitimacy of speculation, pointing out the dangers of attempting to control by external pressure, but advocated the adoption of new rules through the creation of public sentiment and suggestions by the legislative body.

In Germany it was thought for a time that the Bourse was the cause of the low prices paid to the producer, and therefore in 1896 legislated against the Bourse and absolutely abolished the dealing in options and futures. The result was that Berlin, which at one time was the grain center of Germany, lost her prestige, and for a time the produce exchange went out of existence, but was later revived in 1900. The exchange was directly under the Government, who gave some control to a body known as the Elders of Berlin Merchants. In their annual report for 1899, the year when there was no exchange, they reported as follows:

The heavy loss suffered by the dealer choked with merchandise, difficulties experienced by the producers in disposing of their corn, and the depression in the milling industry were the features of the year.

Business was so restricted that many firms closed their doors altogether. The effect of the abolition of futures was supposed to be realized in the increased price paid to the producer, but the actual results were directly opposite to those expected and legislated against. During the period of high prices in the spring and the low prices in the fall the German quotations as rendered by the Government were below the New York prices; in fact, they were considerably below the American prices.

In 1900 the exchange was again opened, but the restriction on futures was not taken off. With the opening of the exchange conditions improved, but because of the lack of opportunity to deal in futures and options the exchange played little part in the determination of price, and business was paralyzed; effectual insurance against loss became extremely difficult and expensive, as the foreign markets—London and New York—had to be resorted to. The effect was to throw business into the American markets or other foreign markets, and these markets practically controlled the local price. Efforts were made to find substitutes for futures, but without any real degree of success. The condition of the German market and conditions is summarized in the report of the Elders of Berlin Merchants for 1901:

Prices on home markets were regulated chiefly by the American exchange, which derived the greatest advantage from the suppression of the business in futures and options in Germany. They were fully aware of this fact and had their quotations published and circulated all over the country. It can safely be stated that no transaction of any importance is made in Germany (1901) without being largely influenced by the American tendency.

Even the Government admitted that the laws had been "injurious to the public" and that "the dangers of speculation had increased," so in 1908 a new law was drafted which reinstated dealing in futures and options except in corn products and combed wool.

Germany, in 1896, laid the blame for the low prices being paid to the producer and all the evils connected with exchanges on speculation in futures and options, and declared that these elements were responsible for the fluctuations of price, and consequently they thought they would eliminate all these evils by destroying the source, with the consequent abolition of futures.

The American people to-day are making the same charges against our chambers and exchanges as the German people made in 1896. In Germany they tried to remedy the legitimate dealings in futures by destroying them. Germany has experienced the actual effects of the abolition of futures and options.

It is interesting to note that the very evils that were supposed to be removed by this legislation were, in fact, increased.

Prof. Henry Emery, of the Columbia University, made a study of the effects of the bourse law in Germany which may be enumerated as follows:

1. Fluctuations in prices have been increased rather than diminished. The corrective influence of the bear side of the market having been restricted the tendency to an inflated bull movement was increased in times of prosperity. This in turn made the danger of radical collapse all the greater in proportion as the bull movement was abnormal. The greater funds needed to carry stock on a cash basis further increased the danger when collapse was threatened. The result was an increased incentive to reckless speculation and manipulation.

2. The money market has been increasingly demoralized through the greater fluctuations in demand for funds to carry speculative cash accounts.

3. Business within the banks is done on the basis of exchange prices, but these became more fluctuating and subject to manipulation as the quantity of exchange dealings were diminished and were concentrated in a few hands. The advantages of a broad open market were lost. The object of the act has been to lessen the speculative influence over industrial undertakings. Its effect was to increase it.

4. The effect of interference, increased cost, and legal uncertainty was to drive business to foreign exchanges and diminish the power of the Berlin exchange in the field of international finance.

I have tried to do nothing more in these remarks than to give a short history of the grain trade as it has developed in this country and to show the different elements which enter into the business of merchandising grain. It is evident from the foregoing remarks that the development of elevators, elevator receipts, warehouses, as well as the system of weighing, inspection, grading, and markets, are all necessary to the economic handling of grain and serve a useful and important function which has grown up in response to an imperative demand for an efficient method of handling and marketing of produce. However, the relation of speculation to a modern market and its good and evil effects is debatable. But before we attempt to destroy the whole system of speculation we should first try to preserve the good in our attempt to eliminate the evil, and if that is impossible, then the speculative feature will have to give way.

Regulation in Interstate Commerce of Watchcases and Watch Movements.

EXTENSION OF REMARKS

OF

HON. J. HENRY GOEKE,

OF OHIO,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, March 2, 1915.

Mr. GOEKE. Mr. Speaker, early in this Congress I introduced the bill H. R. 2972, which was referred to the Committee on Interstate and Foreign Commerce, of which committee I have the honor of being a member, having for its purpose the regulation in interstate commerce of watches and watchcases, and to prevent the transportation in interstate commerce of gold-filled or gold-plated watchcases bearing "time guarantees," and to prevent the misbranding of watch movements and watchcases. Extended hearings were had by the committee on the subjects of the bill, all of which have been printed, but for want of time and because of the press of other important business, it was impossible to obtain consideration of the measure in this Congress. The committee recently adopted a resolution in which it expresses its belief in the importance of giving early attention to this and kindred subjects, deeming it necessary in order to bring about fair dealing and prosperity to consumers as well as to the dealers in such articles, and expressing it as the sense and opinion of the committee that consideration of these subjects should be had by the committee at an early date during the next session of Congress, and strongly recommending such course.

The frauds perpetrated upon the public by resorting to the practices that I shall hereafter disclose are among the most flagrant evils that exist in the entire business world. Under the pretense of a guarantee that gold-filled watchcases are durable in wear and honest in ingredients and workmanship, the most unwarranted and exorbitant prices, entirely out of proportion to the value of the article offered, are obtained from the consumers. A large percentage of the people of this country are constantly being defrauded by the placing upon the market for sale misrepresented gold-filled watchcases and watch movements. In most cases retail dealers are not to blame for the impositions practiced upon the public. This particular fraud is universally carried on by so-called auction stores, and the owners of these auction stores are able to carry on and practice these frauds by reason of the dishonest manufacturers engaged in the business. Therefore the frauds practiced in this line of trade are, of course, made possible in the beginning by the manufacturer, and there is where it ought to be corrected.

The simple purpose of the pending bill is to require that gold-filled or gold-plated watchcases shall be placed upon the market in such a manner that the consumer may know whether he is getting a genuine article or a counterfeit. The proposed act does not prohibit the manufacture of an article and manufacturers may continue to turn out what they please, but its effect is to prohibit the shipment in interstate commerce of the articles mentioned unless they comply with the provisions of the bill.

The provisions of the bill are as follows:

Section 1 of the bill relates to gold-filled or gold-plated watchcases only, and prohibits the transportation in interstate commerce of gold-filled or gold-plated watchcases, which, or the tags, etc., attached to which, are stamped with the word "Guaranteed" or the word "Warranted" with or without other words indicating duration of wear or with any other words importing time or permanance.

Section 2 relates to gold-filled or gold-plated watchcases only, and prohibits the transportation in interstate commerce of gold-filled or gold-plated watchcases unless there be stamped or marked conspicuously and indelibly on the inner surface of the lids or caps of such watchcases the name or properly registered trade-mark of the maker or manufacturer thereof. It also provides that where the words "gold-filled" are stamped upon a watchcase such stamp shall be accompanied by a mark indicating the fineness of the gold contained in the case by karat. It defines what shall constitute a case marked "gold-filled"; providing that a watchcase marked "gold-filled" shall have a minimum thickness of gold of three one-thousandths of an inch for the outside of the backs, etc., and one one-thousandths of an inch for the inside of the backs, etc.

Section 3 relates to solid gold watchcases only, and provides that where the word "gold" is stamped upon a watchcase it shall be accompanied by words or marks indicating the carat or fineness of the gold or its alloy contained in such watchcase, and it further provides that the name or the properly registered trade-mark of the maker or manufacturer thereof shall be stamped on the inner surface of the lids or caps of such watchcase.

Section 4 relates to watch movements only, and prohibits the transportation in interstate commerce of any watch movement unless there be cut, engraved, or diesunk conspicuously and indelibly on the top plate of such movement the name or properly registered trade-mark of the manufacturer or maker thereof, and unless there also be cut, engraved, or diesunk on such top plate the number of jewels contained in, and the number of adjustments of, such watch movements, such numbers to be expressed both in words and Arabic numerals. This section also prohibits the improper marking of watch movements in respect to the number of their jewels and their adjustments.

Sections 5, 6, and 7 are administrative sections, and section 8, the last section, provides that the bill shall take effect six months after the date of its passage.

TIME GUARANTIES.

The use of "time guarantees" on gold-filled or gold-plated watchcases is prohibited by section 1. The "time guarantee," as applied to gold-filled or gold-plated watchcases, means a guarantee as to the length of time or number of years the gold on such plated watchcase will wear before the base metal shows through. Nothing in the section prevents a manufacturer from stating that the case is of a certain quality or kind of workmanship, but the prohibition goes to "time guarantees" only, and the use of the words "guaranteed" and "warranted," which have acquired by reason of long usage a limited meaning, to wit, time of wear, and in order to make the remedy really effective the use of said two words must be prohibited.

Time guarantees on gold-filled or gold-plated watchcases should be prohibited because of frauds practiced on the public which result from their use.

EVIL TO BE REMEDIED.

Frauds.—The opportunities for deception in the manufacture and sale of gold-filled or gold-plated watchcases have resulted in flagrant frauds on the public. The country is flooded with brass watchcases thinly plated with gold and stamped with guarantees of wear for long periods, generally for 20 years. Thousands of such watchcases are now on the market, containing less than 20 cents' worth of gold on them, which is guaranteed to wear for 20 or even 25 years, a thing utterly impossible. Such spurious marking is done in different ways:

First. Sometimes by the manufacturer, either of his own motion or at the request of a wholesale customer.

Second. After having left the manufacturer's hands without any guarantee, and sold for what they really are, the cases are then spuriously marked by dealers.

In either instance the consumer, at least, if not the retail dealer, is imposed upon, being induced to purchase an article whose wearing qualities are ridiculously below those of the so-called guaranty. Where the guaranty has been stamped by the dealer, to the purchaser it appears as the guaranty of the manufacturer, when it is the guaranty of an irresponsible and fraudulent dealer, and the manufacturer can not be held on the guaranty; and where it is stamped by the manufacturer, the latter is liable to go, and in many instances has gone, out of business, leaving quantities of cases with spurious and unredeemed guaranties in the hands of the dealers and consumers. Moreover, the guaranty is frequently accompanied by the name of a fictitious manufacturer, the real manufacturer concealing his identity. In these instances the unfortunate purchaser of

the watchcase is remediless when the plating of gold wears through. He then for the first time learns that he has a worthless brass case, and there is no one upon whom he can call to make it good. By reason of these fraudulent practices, the innocent purchaser is cheated. The reputation of the dealer suffers, and he loses the confidence of his customers. The honest manufacturer who attempts to put as much gold on his filled cases as he thinks will make them wear for the time for which they are guaranteed finds himself in ruinous competition with his dishonest competitor who places long-time guaranties of wear on watchcases which contain so little gold as to make them practically worthless.

The processes of manufacture of gold-filled or gold-plated watchcases are such as to make it impossible to tell the exact thickness of the plates of gold on a finished watchcase, and the length of time the gold plate on a gold-plated watchcase will wear depends upon the conditions under which it is worn, as well as the thickness of the plates of gold covering the base metal.

PROCESSES OF MANUFACTURE.

The stock from which gold-filled or gold-plated watchcases are made consists of a plate of gold soldered to each side of a bar of base metal and rolled to thickness. A bar of base metal about 1.060 inches in thickness has soldered to each side of it a bar of gold about 0.150 inch in thickness on the outside and 0.060 inch in thickness on the inside. This bar is then rolled down to the proper thickness required in a rolling mill. Great care must be exercised in preparing the base-metal bar, as well as the gold bars soldered thereto, in order to prevent too great a variation in the relative thickness of the base metal and the gold plates, which will result from a variation in the density or the consistency of the metal used.

Experience has shown that no two bars will reduce in exactly the same proportion, due to the variation in the density of the metals. After the metal has been rolled down to the requisite thickness, the stock is then taken to the presses and cut out, first in disks and then domed up to shape, and after being domed to shape the edges are turned over, making the snaps. After leaving the press department the pieces are taken to the turning department, where they are spun up to finished shapes. The various parts are then assembled and ready for the polisher and decorator. To secure a perfectly smooth surface the outside of the lids must be stoned off and polished down before being engraved or engine-turned.

There are a great many parts, trimmings, etc., for which the metal is prepared in the same manner as described above. If the case is to be engraved the design is cut into the gold by an engraver. If it is to be engine-turned it is placed in a machine and the desired decoration put on it by machinery.

While manufacturers aim in preparing the parts to put the gold on of sufficient thickness to finish up from thirty-five ten-thousandths to five-thousandths, yet the process of manufacture makes it impossible to determine the exact thickness of the plates of gold covering the base metal when the case is finished.

The evidence submitted would seem to justify the following conclusions:

1. It is impossible to tell the thickness of the plates of gold on a finished gold-filled watchcase without destroying the case, for the reason that the only way to test a case for actual thickness is to cut out a piece of the gold and measure it. This is done by eating the base metal out with acid, thereby ruining the case.

2. The thickness of the various plates of gold is sure to vary on all cases, and the processes of manufacture are such as to make it next to impossible to make them uniform. For instance, if 25 cases were made from one bar of gold, some of the cases being finished engine-turned, some engraved, and the others plain, it is improbable that any two of said cases, when finished, would show the same thickness of gold on the various plates.

3. The different parts of a properly constructed watchcase have different thicknesses of plates of gold for the centers, backs, caps, bezels, and outer and inner plates. In other words, all the parts are made from the same character of stock but from different pieces of stock, each of which is thicker or thinner than the others.

4. While manufacturers of gold-filled watchcases have certain thicknesses which they attempt to work to, yet, no matter how great care is exercised, there will always be more or less variation in the finished article. This is influenced by a great many things which are beyond absolute control. For instance, two meltings of gold of the same alloy will come out with different degrees of hardness, as will also different meltings of composition metals which form the filling. In consequence, when plating two bars of filled stock, though the relative proportion of the gold to the composition metal at the time of laying it on be identically the same, by the time these are rolled down to a thickness of stock for making the various parts of the case the thickness of the plates of gold may vary somewhat from that intended.

The various parts of a watchcase are formed in dies or by spinning operations, so that at times in certain places on parts of a case the gold may be stretched a little thinner, while in other parts it may be crowded in the die so as to make it a little thicker.

5. Engine turning and engraving a case always take off a certain amount of gold and make it impracticable to fix certain absolute standards of thickness, and one workman may take off more gold in engraving and engine turning a case than another.

6. An important matter that must be taken into consideration is the polishing. One case may have a few more scratches or imperfections in the surface and need more polishing than another, or one workman may be a little more careless in his work than another, thereby materially affecting the actual measurement of the plates of gold. Very often a case has to be repaired in some way so that it requires repolishing, which would again affect the thickness of the plates of gold, and very often jewelers will buff cases off which they have in stock, and this may again affect the thickness. Also, in soldering the joints, pendants, and so forth, the metal becomes oxidized and must pass through a pickeling solution of sulphuric acid, which removes the oxide and takes a small scale of the gold with it. From the processes of manufacture, therefore, the manufacturer who attempts to guarantee a watchcase, even though he had the means of knowing the conditions under which it would be worn, which is impossible, not being able to determine the thickness of the plates, would be only guessing at the length of time the watchcase would wear.

CONDITIONS OF WEAR.

The length of time a watchcase will wear depends upon the manner in which it is worn, so that no fixed standard can be determined or worked out as to the amount of gold that should be placed upon a filled watchcase in order to make it wear for a specified time. A watchcase in the pocket of an engineer or a stonemason, where the pocket is subjected to or contains more or less dust and grit, can not possible wear the length of time that a watchcase worn by a bookkeeper or a professional man, where the pocket is not subjected to dust and grit, would wear.

The evidence of fraud developed during the hearings on the bill were very complete. In this connection it was shown that six watch cases were submitted to Jacob B. Eckfeldt, assayer of the mint of the United States at Philadelphia, each of said watch cases being guaranteed for 20 years. Also, five watch cases were assayed by Henry W. Detmering, superintendent of the Dueber Watch Case Manufacturing Co. In each instance reports were rendered and submitted to the committee showing the amount of gold in each case.

EXHIBITS ILLUSTRATED IN HEARINGS AND REPRINT OF SPEECH.

Owing to a ruling of the Joint Committee on Printing, I am unable to print herewith exhibits of these cases with the assayers' reports thereon, as I would like to do, but invite your attention to the same as printed in the hearings before the Interstate and Foreign Commerce Committee. These exhibits, together with other illustrations bearing on this subject, will also be found in a reprint of this discourse.

Upon examination it will be found that the cases submitted to the assayers, as above mentioned, were all stamped "Warranted 20 years," but that, according to the assayers' reports, the gold contained in them ranged from 4.7 cents in value to 50 cents in value per case. Further, it will be found that each case bears a supposed name of a manufacturing company which in reality has no existence as such.

This spurious marking is done in different ways, sometimes by the manufacturer either of his own notion or at the request of a wholesale customer, and very often the spurious marks are placed upon the case after it has left the manufacturer's hands without any guaranty being stamped in the case. A very convincing exhibit showing how this is done was submitted during the hearings before the committee under affidavit. This exhibit will be found, as above mentioned, in copy of the hearings, as well as in reprint of this speech.

COURT-RECORD EVIDENCE.

The record in a suit brought in the United States Circuit Court for the Southern District of Ohio, between a certain watchcase company and a certain firm of wholesale dealers, shows that the defendant had ordered from plaintiff 19,000 so-called five-year watchcases to be stamped "Ohio Merc. Co., warranted 20 years," for which the defendant agreed to pay

$1.10 each. According to the pleadings about 6,000 of the cases were actually delivered, when the defendant refused to receive the balance, because, apparently, they were so bad that even he could not dispose of them. One of these watch cases, marked "Ohio Merc. Co., warranted 20 years," was assayed as having 4¼ cents worth of gold in it.

In addition to the foregoing evidence, and for the purpose of showing to what extent the guaranty is being used for the purpose of baiting innocent purchasers, an affidavit of Norman L. Schneider in regard to 12 watches, including cases, advertised as guaranteed from 5 to 20 years in a farm journal of general circulation, with facsimiles of the advertisements, was submitted to the committee during the hearings. Mr. Schneider sets out in his affidavit clearly the kind and nature of the articles he received by answering said advertisements. The guaranty was used as a strong argument in each advertisement to attract the prospective purchaser. The junk Mr. Schneider received in answering these advertisements almost fills a suit case. He got all kinds of jewelry in addition to the watches, all of which was simply junk and of no real value whatsoever. The 12 advertisements will be found illustrated in the prints mentioned above.

One of the methods used in guaranteeing watchcases for a specified number of years has been to place in each case a paper certificate. During the hearings there was submitted evidence of instances where these certificates were issued under a fictitious name, some of them in imitation of the names of reputable concerns, the guaranties being false in every particular. Forcible illustrations of this will be found as above mentioned.

Section 2 of the bill as originally drawn prohibits the transportation in interstate commerce of gold-filled or gold-plated watchcases unless there be stamped or marked conspicuously and indelibly on the inner surface of one of the lids or caps of such watchcase the name or properly registered trade-mark of the maker or manufacturer thereof. This provision, when enacted into law, will enable the purchaser or dealer to trace each case to its maker.

In order to fully carry out the purpose of the measure I have concluded, after careful study, that certain changes should be made in the pending bill, viz:

Section 2 should be amended so that it provides that watchcases stamped gold-filled shall be manufactured so as to comply with the following minimum requirements as to thickness and distribution of the gold.

First. The backs and the caps shall be made of two sheets of gold soldered, brazed, or otherwise affixed to inferior metal.

Second. The center, bezel, pendant, and bow shall be made of one sheet of gold soldered, brazed, or otherwise affixed to inferior metal.

Third. The thickness of the sheet of gold on the outside of backs, center, open-face bezel, pendant, and bow shall not be less than three one-thousandths of an inch.

Fourth. The thickness of the sheet of gold on the inside of the backs, both sides of the caps, and the outside of the hunting-case bezel shall not be less than one one-thousandth of an inch.

Fifth. Gold sheets of uniform carat fineness shall be applied to each part of every gold-filled case where gold is used.

Sixth. Any watchcase stamped gold-filled containing sheets of gold of greater thickness than three one-thousandths of an inch upon parts where three one-thousandths of an inch are therein provided may be marked or stamped by the manufacturer thereof in such a manner as will denote the thickness of the gold sheets so used, but in case such watchcase is so marked then such mark or marks shall state such thickness correctly.

Seventh. Whenever the thickness of the gold sheet is stamped in such watchcase it shall only refer to the thickness of the sheet of gold on the outside of the backs, the open-face bezel, the center, pendant, and bow, and in no instance shall the thickness of the gold on any of such parts be less than the mark indicating such thickness which may be stamped in the case. Such marks shall be in decimals indicating the thousandths of an inch.

Eighth. For testing purposes the thickness of the sheet of gold shall be determined by measurements at a point on such part of the watchcase where there has been no gold taken from or added to such watchcase by any process of decoration.

Ninth. Every watchcase stamped "gold-filled," in accordance with the terms and definitions provided therein, shall also have conspicuously stamped, die sunk, or engraved within such case the degree of carat or fineness of the gold sheets used.

Tenth. The carat fineness must be stamped in accordance with the requirements of the Vreeland law.

SECTION 3.

Section 3 as originally drawn provides that no watchcases stamped with the word "gold" shall be transported in interstate commerce unless the gold, or its alloy, of which such watchcase is composed shall not be less by more than three one-thousandths parts than 9 carats in fineness, and unless accompanying such word "gold," or any words or marks indicating gold or its alloy, and in close proximity thereto, there be also stamped, branded, engraved, or imprinted figures or marks indicating the carat or fineness of such gold or its alloy.

Pure gold is 24 carats fine. The original standard of manufacturers of gold watchcases was taken from the standard of foreign countries, such as England and France, in which countries the purity of the metals used in the arts has been regulated for years, so that by the infliction of severe penalties it was possible in those countries to keep the fineness and the purity of the gold used up to standard. In the early history of the manufacturing of gold watchcases in America 18 carat, 14 carat, and 10 carat were used. It was not considered advisable, either from a mechanical or commercial standpoint, to go lower than 10 carat. A minimum of 9 carat is provided by the laws of England, Canada, and Australia. Nine carat is probably the lowest that should be allowed, as it will stand the acid test and maintain its color. It would, therefore, seem that 9 carat is the proper minimum standard that should be fixed for gold watchcases in this country.

The 9-carat minimum provision of this section, however, should be eliminated.

The provision of section 3 that all watchcases marked "gold" or "solid gold" shall be stamped with figures or marks indicating the carat or fineness of such gold is a most important provision, for it will prevent the dishonest manufacturer or dealer from making a case of a very low carat of gold, marking it "gold," and then disposing of it to the unsuspecting public as an article of a very much higher grade of gold than it actually contains. The carat mark should be required to be stamped upon all cases marked "gold" or "solid gold."

This section (3) should be amended to provide:

First. That the name or properly registered trade-mark of the maker or manufacturer be required to be stamped on all gold cases.

Second. For the double and concurrent test provided in the Vreeland law for testing gold watchcases.

As heretofore stated, the 9-carat minimum provision of section 3 should be eliminated.

SECTION 4.

Section 4 should stand as originally introduced. This section prohibits the transportation in interstate commerce of any watch movement unless there be cut, engraved, or diesunk, conspicuously and indelibly, on the top plate of such watch movement the name or properly registered trade-mark of the manufacturer or maker thereof, and unless there also be cut, engraved, or diesunk on such top plate the number of jewels contained in and the number of adjustments of such watch movements, such numbers to be expressed both in words and in Arabic numerals.

This section also prohibits the improper marking of watch movements in respect to the number of their jewels and their adjustment.

In 1908 it was suggested to the committees of Congress that for the purpose of preventing frauds in the importation of watch movements a provision be written into the tariff law requiring that the number of jewels and adjustments be stamped upon the plates of all watch movements imported. These suggestions to Congress not only provided that the number of jewels and adjustments be stamped upon all watch movements imported, but provided that the name of the manufacturer as well be stamped upon the plates. Evidence submitted showed that it was the practice, which had become prevalent, for watches to be imported without any marks whatever upon the plates and, after they had been cleared, to have false marks engraved upon the plates of the movements; for instance, a 7-jewel watch would be marked 23 jewels; the movement not being adjusted within the scientific acceptance of the term "adjusted," would be marked adjusted three position, to heat and cold. Furthermore, a name would be engraved upon the plate, simulating the name of American railroad watches. These watches were then sold to the public at exorbitant profits under these fraudulent representations by watch droppers, auction houses, and in various ways. These fraudulently marked watches were frequently sold to railroad

men, in whose hands they were discovered by the officials of the railroad time-inspection service.

A great many letters and affidavits have been submitted in regard to these fraudulent practices. One instance is a good example of many. A prominent watch inspector says:

I have before me a Swiss-made watch which was brought into my office yesterday by a man who loaned a railroad employee $5 on the watch. The markings on this watch are as follows: "Missouri Pacific," "Specially adjusted," "Extra quality," "Highly 21 jeweled," "Swiss." I find it has five "jewels," made of glass; and the center "jewel," one of the most important bearings in the watch, has the appearance of a ruby, but upon examination we find it is made of red wax. The markings on this watch indicate that the figures giving the numbers of jewels at 21 were stamped on the plate after the watch passed through the customhouse. I have another watch movement before me, which was recently detected in the hands of a railroad employee. It bears the following markings on the plates: "Bell special," "23 Ruby jewels," "Adjusted." On the dial is also marked "Bell special." The number '23" was stamped on this watch evidently after it passed through the customhouse, as it is a very rough job, while the other lettering is plain and well done. This watch has only seven glass jewels. The general inside finish of both watches, and under the dial, is very rough and poor.

Such fraudulently marked watches are sold to the innocent customer at a profit of between 500 and 1,000 per cent.

A large business has been built up in America in cheap Swiss watches, made in imitation of American movements, by the use of false markings and fictitious names and initials to simulate the names of well-known American manufacturers of railroad watches. After the passage of the act of 1909, in order to carry on this practice, it was necessary to bring in the movements as material, for the reason that complete movements are required to be marked, and the result has been that large quantities of knock-down, cheap watch movements have been brought into this country, assembled and marked with the false markings, and sold to the innocent consumers as heretofore. In order to stop this practice, and to prevent any American manufacturer from marking his watches falsely, this section (4) was incorporated in the bill.

SECTION 5.

Section 5 of the bill will be made much stronger by amending so as to provide that the sale or importation in interstate commerce of watchcases or watch movements in violation of any of the provisions of the act shall be prima facie evidence that such violation was committed knowingly.

SECTION 7.

Section 7 of the bill should be amended by broadening the definition of the word "jewel" so as to include scientific rubies or sapphires and stones of equal hardness, provided they serve a mechanical purpose as a frictional bearing.

CANADA ABOLISHES TIME GUARANTEES.

E. M. Trowern, of Toronto, Canada, provisional secretary of the Retail Merchants' Association of Canada, where time guarantees on gold-filled and gold-plated watchcases have been prohibited by law for over seven years, has written the following strong letter upon this subject. This indorsement is of great importance, in view of the fact that it comes from a man who has been in close touch with the workings of the Canadian law, and who is in a position to know the benefits the public, as well as the legitimate dealer, will gain from the prohibition of time guarantees on gold-filled and gold-plated watchcases and the provisions of this bill.

Mr. AUGUST LOCH,
Chairman Special Committee,
The National Retail Jewelers' Association,
Pittsburgh, Pa.

DEAR SIR: I am in receipt of your esteemed favor of June 3, and also a copy of a bill which has been introduced in the United States Congress, and the brief accompanying same, all of which I have read over with a great deal of interest. I must apologize for the delay in answering your letter, owing to my absence from the city.

In reading over your letter, I can see that you have experienced in the United States the same troubles in connection with guarantees in filled watchcases as we have gone through in Canada.

Your bill seems to me to be a very good one, indeed, and as it is for the protection and in the interests of the watch-buying public at large, and works no hardship to anyone (except those who have been using the guarantees for the purpose of defrauding), there would seem to be no reason why your legislators should not take prompt action in passing this bill.

For many years the retail jewelers of Canada, who desired to build up their businesses upon a sound foundation and sell goods according to their merits, found themselves in competition with, and seriously handicapped by, those who were more anxious to secure exhorbitant profits than they were to secure for themselves a good reputation. As time passed on the evil became worse, and as competition grew more keen the unscrupulous dealers would have filled cases of an inferior quality bearing guarantees made for them, which were represented as being much better than they really were, and naturally the public were the ultimate sufferers.

The situation finally became so acute that the retail jewelers of Canada decided that the only way to correct this was through an act of Parliament prohibiting the stamping of guarantees in filled cases, and thus compelling goods to be sold on their merits, rather than on account of fictitious guarantees.

In due course this law was enacted by Parliament, and at the same time there was embodied in the act a provision that in articles made of solid gold the actual fineness of which must be made according to the carat of quality stamp on the article, and that no article should be stamped or represented as solid gold which was less than 9 carats in fineness—as anything below that can not be depended upon to hold its color in service and should not be represented as gold—and thus putting a stop to the frauds which had become so prevalent, of selling articles of gold stamped a much higher quality than they actually were.

The act also provided that watchcases and other articles must bear the name or registered trade-mark of the maker, in order that the manufacturer can be traced and held responsible for any misrepresentation.

The purpose of the act is to protect the honest retailer from the false advertisement and representation of unscrupulous competitors, and to protect the consumer from the frauds and misrepresentations which had become so prevalent.

When the act was first prepared and presented to the trade there was a fear expressed by a few that the abolition of the right to guarantee a gold-filled watchcase to wear for a certain number of years would mean a loss of sales, on account of the long time for which this custom had been established, but these fears have long since disappeared, and the result (after the law has been in effect for about seven years) has been greater stability and confidence, not only on the part of the public, but also as between the retailers, wholesalers, and manufacturers.

A little reflection regarding the guaranteeing of gold-filled cases will soon convince any honest retailer that he should not be a party to foisting upon his customer a condition that it is impossible for anyone to carry out, as each watchcase sold is subject to the varied conditions of the wearer; one case with twice as much gold on as another may only wear one-half the length of time.

It would readily be seen that a watchcase in the pocket of a railroad engineer, stonemason, farmer, mechanic, or anyone where the pocket becomes filled with dirt or grit, can not possibly wear for anything like the length of time as the same case in the pocket of a merchant, clerk, or anyone whose occupation is such that the pocket remains clean and free from dirt and grit.

In many instances watchcases which were stamped by the manufacturer with a five-year guaranty would fall into the hands of a dishonest dealer, who would stamp or engrave a 2 in front of the 5 and then sell them for a 25-year guaranty case.

From our personal experience of several years operating under the law prohibiting guaranties in Canada, I have no hesitation in saying that our brother retail jewelers in the United States will soon have cause to congratulate themselves if your legislature will pass the bill which has been introduced, and give you the relief asked for from this very pernicious system of guaranteeing filled cases. Watches will then be sold upon the reputation of the maker and the dealer and the merit of the goods, and the watch-buying public will be benefited thereby.

Wishing you every success in your undertaking, I am,

Sincerely, yours,

E. M. TROWERN,
Secretary Jewelers' Section.

CANADIAN LAW.

The United States and Canada have been the greatest markets for gold-filled and gold-plated watchcases. Comparatively few gold-filled watchcases are sold abroad. Canada, where gold-filled cases are extensively sold, about seven years ago, by an act of Parliament, prohibited the stampings of guaranties on gold or silver plated ware, including gold-filled and gold-plated watchcases. Canada thereby set a precedent for a similar law in this country. The Canadian act was first passed in 1906. The Canadian act assented to July 13, 1906, and cited as the "Gold and silver marking act, 1906," provides:

2. Everyone, being within the meaning of this act a dealer, is guilty of an indictable offense and is liable to the penalty by this act provided, who (c) makes use of any printed or written matter, or applies any mark guaranteeing or purporting to guarantee that the gold or silver on or in any article of the kind referred to in this section will wear or last for any specified time.

In 1912 the Canadian law was revised in a number of particulars and very materially strengthened and made more drastic in regard to the stamping of time guaranties on plated articles as follows:

14. Everyone is guilty of an indictable offense and liably on conviction thereof to a fine not exceeding $100, who, being a dealer within the meaning of this act, (a) applies to a plated article any mark which guarantees or purports to guarantee or induces or tends to induce a belief that the gold or silver with which the article is plated will wear or last for any time, whether specified or not; (b) makes in Canada, sells in Canada, or imports or otherwise brings into Canada any plated article to which any such mark is applied; (c) in Canada prints, causes to be printed, issues, publishes, or otherwise makes use of any printed matter of the nature of an advertisement guaranteeing or purporting to guarantee or inducing or tending to induce a belief that the gold or silver with which a plated article is plated will wear or last for any time, whether specified or not; (d) imports or otherwise brings into Canada any such printed or written matter; (e) attempts to commit any offense described in the foregoing paragraphs of this section.

Careful investigation of the results of the operation of the Canadian law proves that it has been extremely satisfactory.

LEGISLATION UP TO DATE ON THE SUBJECT.

(*a*) United States assay law.—In 1905 Congress passed an act to prevent the use of devices calculated to convey the impression that the United States Government certifies to the quality of gold or silver used in the arts. This law, known to the trade as the United States assay law, was the first enactment by Congress tending toward an abatement of frauds in interstate commerce in the manufacture and sale of articles manufactured from gold or silver.

(b) Gold-stamping law.—In 1906 Congress enacted the gold-stamping law. The President signed the national gold-stamping law on June 13, 1906, which was an important step in the right direction and which has tended to prevent fraud by dishonest manufacturers and dealers in spuriously marked articles of gold and silver.

INDORSEMENTS OF THE BILL.

This proposed legislation has been generally indorsed, as will be seen from the following:

The American National Retailer Jewelers' Association, with 26 State retail jewelers' associations affiliated, unanimously approves this bill.

The National wholesale Jewelers' Association passed resolution approving elimination of time guaranties.

Detroit Jewelers' Board of Trade passed resolution indorsing bill.

Idaho retail Jewelers' Association unanimously passed resolution approving bill.

Illinois Retail Jewelers' Association unanimously passed resolution approving bill.

Indiana Retail Jewelers' Association unanimously passed resolution approving bill.

Kansas Retail Jewelers' Association unanimously passed resolution approving bill.

Maryland Retail Jewelers' Association unanimously passed resolution approving bill.

Michigan Retail Jewelers' Association unanimously passed resolution approving bill.

Minnesota Retail Jewelers' Association unanimously passed resolution approving bill.

Missouri Society of Retail Jewelers unanimously passed resolution approving bill.

New Jersey Retail Jewelers' Association unanimously passed resolution approving bill.

New York Retail Jewelers' Association unanimously passed resolution approving bill.

North Carolina Retail Jewelers' Association unanimously passed resolution approving bill.

North Dakota Retail Jewelers' Association unanimously passed resolution approving bill.

Ohio Retail Jewelers' Association unanimously passed resolution approving bill.

Oklahoma Retail Jewelers' Association unanimously passed resolution approving bill.

Pennsylvania Retail Jewelers' Association unanimously passed resolution approving bill.

South Dakota Retail Jewelers' Association unanimously passed resolution approving bill.

Texas Retail Jewelers' Association unanimously passed resolution approving bill.

Virginia Retail Jewelers' Association unanimously passed resolution approving bill.

Washington Retail Jewelers' Association unanimously passed resolution approving bill.

West Virginia Retail Jewelers' Association unanimously passed resolution approving bill.

Wisconsin Retail Jewelers' Association unanimously passed resolution approving bill.

Colorado Retail Jewelers' Association unanimously passed resolution approving bill.

Arkansas Retail Jewelers' Association approve eliminating time guaranties.

Iowa Retail Jewelers' Association approve eliminating time guaranties.

Maine Retail Jewelers' Association approve eliminating time guaranties.

Nebraska Retail Jewelers' Association approve eliminating time guaranties.

The Pacific Coast Gold and Silversmiths' Association approve elimination of time guaranties.

Retail jewelers in States not having associations indorsed bill: Laramie and Cheyenne, Wyo., and Reno, Nev.

Mid-year conference of officers and committees of the American National Retail Jewelers' Association, held at Chicago, January 14, 15, and 16, 1914, approved bill and proposed amendments.

The Connecticut Retail Jewelers' Association on January 27, 1914, unanimously passed resolution approving bill.

The Southwestern Michigan Retail Jewelers' Association on February 2, 1914, unanimously passed resolution approving bill.

Maine Retail Jewelers' Association on February 10, 1914, again unanimously passed resolution approving bill.

The Nebraska Retail Jewelers' Association on February 17, 1914, again passed resolution unanimously indorsing bill.

Minnesota Retail Jewelers' Association on February 25, 1914, again passed resolution unanimously indorsing bill.

Northwestern Wholesale Jewelers' Association in March, 1914, unanimously passed resolution indorsing bill.

Oklahoma Retail Jewelers' Association on April 15, 1914, again unanimously passed resolution indorsing bill.

Ohio Retail Jewelers' Association on April 22, 1914, again unanimously passed resolution indorsing bill.

The Pacific Coast Gold and Silversmiths' Association on April 21, 1914, unanimously passed resolution indorsing bill.

Macon (Ga.) Jewelers' Association filed letter approving bill.

Iowa Retail Jewelers' Association on April 15, 1914, unanimously indorsed bill.

West Virginia Retail Jewelers' Association on May 5, 1914, again unanimously passed resolution indorsing bill.

Virginia Retail Jewelers' Association on May 14, 1914, again unanimously approved bill.

New York Retail Jewelers' Association in annual convention in 1914 again passed resolution approving bill.

May 6, 1914, Retail Jewelers' Association at Tucson, Ariz., approved bill.

Pennsylvania Retail Jewelers' Association in annual convention at Philadelphia on May 20, 1914, again unanimously approved bill.

Maryland, Delaware, and Virginia Peninsula Retail Jewelers' Association in annual convention at Salisbury, Md., on June 3, 1914, unanimously approved bill.

The Jewelers' Guild of Philadelphia on June 4, 1914, unanimously approved bill.

The North Dakota Retail Jewelers' Association on June 10, 1914, at Minot, N. Dak., again unanimously approved bill.

North Carolina Retail Jewelers' Association in annual convention at Asheville, N. C., on June 24, 1914, again unanimously approved bill.

Wisconsin Retail Jewelers' Association in annual convention assembled at Milwaukee on July 9, 1914, again unanimously approved bill.

Indiana Retail Jewelers' Association in annual convention assembled at Laporte, Ind., on July 22, 1914, again unanimously approved bill.

Utah Retail Jewelers' Association in annual convention assembled at Salt Lake City, on August 3, again unanimously approved bill.

Idaho Retail Jewelers' Association at Boise, Idaho, in annual convention assembled, August 6, 1914, again unanimously approved bill.

Washington Retail Jewelers' Association in annual convention assembled at Seattle on August 10, 1914, again unanimously approved bill.

The Oregon Retail Jewelers' Association in annual convention assembled at Portland on August 14, 1914, again unanimously approved bill.

The American National Retail Jewelers' Association in annual convention assembled at Chicago, in August, 1914, unanimously approved report of special legislative committee relative to this legislation. Strong resolutions were passed urging Congress to pass the bill.

Twenty thousand retail jewelers in America have expressed their approval of the bill individually by writing thousands of letters indorsing its provisions and commending it as a public measure of great importance to the purchasing public as well as to all honest dealers.

I have discussed this subject at length in the hope of being able to convince the House, as well as the country, first, that the fradulent practices complained of by the honest jewelry manufacturer and retailer are a reality and do great harm not only to them, but to the consumers who buy these spurious articles without knowledge of the existence of these frauds; and, secondly, that the legislation proposed is necessary in order to put a stop to them. As my services in Congress will come to an end with the termination of this session, I will, of course, not be in a position to continue the work of bringing about the enactment of this legislation. I hope, however, that my remarks on this subject may appeal to the Members-elect of the next Congress with sufficient force that the legislation under consideration may be speedily enacted, and thus afford the remedy that will quickly and effectually eliminate from the business world this almost criminal trade practice. I feel confident that the mere publicity given to these frauds by reason of bringing the matter to the attention of the country will make it more difficult in the future for men now engaged in this fraudulent trade to thrive and prosper. For dishonest, crooked, and fraudulent business methods and practices such as those to which I have referred, amounting to nothing more or less than a swindle, can never continue to exist under the searchlight of publicity; but it is not possible to inform everybody, and therefore the ignorant and uninformed or those not in a position to receive information and

who are frequently the least able to bear the injury suffer by permitting these trade frauds to be practiced. The honest manufacturer who is willing to have his workmanship as well as the quality of the article which he holds out for sale to the public tested and examined, the responsible retail and wholesale jewelers who are liable for their business transactions and believe in fair and honest dealing, ought certainly to be protected by law against the unfair and dishonest competitor who now resorts, free from fear of being punished by law, to the use of fraud and misrepresentation in order to out strip them by the sale of his spurious articles to the unsuspecting consumers. I do not believe that any fair-minded person who believes in honest business methods will hesitate to say that legislation of this character ought to be enacted. Certain it is that no honest man can defend such frauds or advocate their existence or continuance. To do so would be to tolerate dishonesty and cheating.

While I greatly regret that the state of business in this Congress has been such that it has been impossible to secure consideration of this legislation, I feel that my labor in behalf of the same has not altogether been in vain if it will result in bringing the subject again to the attention of Congress in its next session. For, though I shall not be here to give the matter further attention, I am sure that some one, perhaps more able than myself to champion the cause, will take it up and bring it to a successful conclusion.

Agricultural Appropriation Bill—Discrimination Against the Ports of the Cotton States.

SPEECH

OF

HON. CHARLES L. BARTLETT,

OF GEORGIA,

IN THE HOUSE OF REPRESENTATIVES,

Thursday, January 28, 1915.

The House in Committee of the Whole House on the state of the Union had under consideration the bill (H. R. 20415) making appropriations for the Department of Agriculture for the fiscal year ending June 30, 1916.

Mr. BARTLETT. Mr. Chairman, I offer the following amendment: On page 74, at end of line 2, after "$50,000," add the following:

Provided, That no part of the sum in this paragraph or this act appropriated shall be used or expended in the enforcing of any rules or regulations promulgated by the Secretary of Agriculture which have for their purpose and intention to, and do in effect, give preference to the ports of one State over those of another.

This amendment is not subject to a point of order made by the gentleman from South Carolina [Mr. LEVER]; it is simply a limitation. Mr. Chairman, I know it is late, but I have waited for two days in order to offer this amendment. This amendment is offered for this reason, and it is in the language of the Constitution of the United States, the exact language, which I will now quote:

"Article 1, section 8, paragraph 6: No preference shall be given by any regulation of commerce or revenue to the ports of one State over another."

The purpose of this amendment is to prevent what would be a great injury to the cotton States that manufacture cotton, the States of North Carolina, South Carolina, Georgia, and Alabama. Some time last year a campaign was inaugurated for the purpose of preventing the southern States from having an opportunity to purchase Egyptian cotton. It was proposed to exclude the importation of Egyptian cotton from the ports of the cotton-producing States but admit to certain ports in the non-cotton-producing States.

This would work serious injury to many manufacturing institutions in the South. I read a letter from the president of the Bibb Manufacturing Co., of Georgia, to show what effect it would have on the business of that company.

BIBB MANUFACTURING CO.,
Macon, Ga., May 20, 1914.

Hon. CHAS. L. BARTLETT,
Care House of Representatives, Washington, D. C.

DEAR SIR: Yours of the 18th instant is duly to hand, and I must say that what you write and the inclosures you send of the proposed action to be taken by the Department of Agriculture gives us a great deal of concern. I alluded to this in postscript of my letter to you yesterday.

This would be for us about as bad as the Edwards bill, and would absolutely, in my judgment, paralyze all the fine yarn mills in the South and turn all the business over to northern and European mills. I think all the southern mills would be absolutely willing to have a Government inspector in their picker room where Egyptian cotton is opened, and if necessary, they themselves pay the wages of such an inspector, rather than have this sort of a proposition go through. So far as the Bibb Manufacturing Co. is concerned, and we think it true of all southern fine yarn mills—all the product of these mills, so far as waste is concerned, is shipped North. There is absolutely no seed that can come out of this cotton that is fit to be used for planting purposes. There is no part of the waste that could in any possible way, in my judgment, be scattered over the country.

Of course, you understood the matter perfectly right—how much New England would jubilate if these restrictions were put on the South.

We are good Democrats in the South, and it does seem to me that we are entitled to some consideration from a Democratic administration.

We are trying to raise long staple cotton out West. We are continually trying to raise it in the South—sea-island, Floradora, and other long staple varieties of cotton—but we can not spin any of this cotton successfully if we should be restricted to it alone. There are competitors in Europe and New England who have a quarter of a million bales of Egyptian cotton that is raised annually to draw from.

There would be one way to deal with this question.

If Egyptian cotton were prohibited from the whole country, if a prohibitive tariff were put on the importation of fine yarns and all fine-yarn goods, of course we could spin up our crop of sea-island and fine staple cotton, but if a thing of this sort were attempted, every automobile manufacturer in the country and the people themselves would raise a howl that would go from one end of the country to the other.

The Bibb Manufacturing Co. itself has contracts outstanding for 1,000 bales of Egyptian cotton, 250 bales to be shipped in June, 250 in July, and 500 in August. If such a bill were passed, restricting the importation of this cotton the 1st of July, it would put us in a very serious position, indeed. Of course, we have goods sold largely to cover our production from this cotton. We could not fill our contracts—our people would be out of work and our Columbus property would be shut down.

I would thank you very much if you would take this matter up with Senator SMITH and the Secretary of Agriculture and advise us by wire of the possible rulings of the department. If they seriously contemplate passing such an order, we would like to know it at once, and, if necessary, I think it would be better, possibly, for the writer and Mr. Jordan to come to Washington rather than simply file a protest, except that you advise especially this proceeding.

Kindly wire me on receipt of this.

Yours, very truly, E. T. COMER, *President.*

This proposed action was taken for one reason, it was said, because the cotton factories in the South were accessible to the cotton fields; the cotton raised in the South was more accessible to its mills than to the mills not located there. The cotton manufacturers of the South had proceeded to that point in the manufacture of cotton goods where they were using Egyptian cotton to manufacture the finer grades of goods. It was then found out by those who were being hurt by the competition of the southern mills that they could manufacture cotton goods of all sorts more cheaply than they could be manufactured elsewhere, and that the competition could not be withstood unless some means were devised by which the Egyptian cotton could not find its way into the markets of the southern manufacturers. And so they said there was danger of a new kind of boll weevil being found in the Egyptian cotton, called the pink boll weevil, and they proceeded to develop this theory of protecting the crops of the South from the invasion of the pink boll weevil.

That effort did not originate in the South, where the crops were said to be threatened by the pink boll weevil, but it originated with the manufacturers of New England, who said we came too fiercely into competition with them in the use of Egyptian cotton in the manufacture of goods by the combination of Egyptian cotton with the short staple cotton. So we appealed to the Secretary of Agriculture, and we had a meeting or hearing some time in May, 1914. I have a copy of the proceedings here. At that hearing the whole matter was gone into. The manufacturers of cotton goods in the South appeared before this board, and showed that the danger was not great, and that by the use of certain means and preventives, which they agreed to use, such as the destruction of the waste that came out of the Egyptian cotton bales and the like, there was no danger. The Horticultural Board of the Agricultural Department came to the conclusion and decided that they would not undertake to resort to harsh means, which they claimed they had the right to take under the quarantine act passed in 1912, to exclude from the ports of the South all importations of Egyptian cotton, but said that if the southern manufacturers would comply with certain requirements that would be all that would be necessary to be done in order to prevent the introduction of this pink boll weevil. So our manufacturers had inspectors sent to the factories and they complied with the rules and regulations, and there has not been any indication that the pink boll weevil will invest the crops of the South.

However, these New England people, bringing into play the forces which started this propaganda, were not satisfied with that, as I am informed by the chairman of the Horticultural Board, or Federal board, in a communication dated January 18, 1915. They did not propose simply to act upon that, but they stated that the means of protection proposed requires the storage of cotton in normal warehouses for four months, in

order to make it absolutely sure that the insects contained in the bales have all perished, and they proposed that the admission of such foreign cotton, including the Hawaiian cotton, will only be permitted when limited to special ports of entry, including the ports of New York, Boston, and San Francisco, the idea being that if Egyptian cotton is imported into the ports of the South, that being a warmer climate, the danger from the pink boll weevil would be greater.

That opinion, however, must vanish when you see that the same order provides that these imports of Egyptian cotton shall be admitted to the port of San Francisco, and I apprehend that no man from California or San Francisco will at any time admit that the climate of San Francisco is not as good as that of Georgia, so far as healthfulness and warm, balmy air are concerned. Now, I say, in order to protect my people, and I have constituents——

The CHAIRMAN. The time of the gentleman from Georgia has expired.

Mr. ADAMSON. Mr. Chairman, I ask unanimous consent that my colleague from Georgia may proceed for five minutes more.

The CHAIRMAN. Is there objection to the gentleman's request?

* * * * * * *

Mr. BARTLETT. Mr. Chairman, the gentleman from Alabama [Mr. HEFLIN] says we are not going to permit any more boll weevils in the South; and that you have got plenty of sea-island cotton in Georgia and elsewhere. There is no danger to the South from the new-found "pink boll weevil"—the gentleman is not informed on the subject. But regardless of that, we should observe the provisions of the Constitution. I am of that school of Democrats who do not believe we should exclude by law any product in order to give an advantage to the product of my State or to the product of the State of the gentleman from Alabama. I say this, that it has been demonstrated that this pretense of keeping the boll weevil out of the Southern States did not originate with anybody in the Southern cotton-growing States. It originated at the instance of the manufacturers in New England, who grew very anxious about our crop and the invasion of our crop by the boll weevil, not because they were anxious about our trouble with the boll weevil, but because we were competing too sharply with them in the manufacture of the cotton that was imported. It did not come from anybody who raises cotton in Georgia or Alabama or North or South Carolina, but the anxiety to protect us grows out of some other motive. There was a bill passed here in 1912, which I then resisted. In fact, I called attention to the fact that it gave to the Secretary of Agriculture powers which ought not to be given to him. My desire was to protect the people of my district and my State, and the people of North Carolina, South Carolina, and Alabama. They all had representatives in May, 1914, before the Secretary of Agriculture, resisting his proposed order.

And after they had been heard, after they had entered into an agreement with the Secretary of Agriculture to comply with all the demands he made upon them, without notice to them the Secretary of Agriculture, through this board, promulgated this order which will prevent them from buying Egyptian cotton for two years after it is imported into the ports of New York, Boston, or San Francisco. In order to protect my people I have simply raised over them the shield of the Constitution, in order that they may not be unduly discriminated against. When the States gave up the right to regulate interstate commerce between the States, when that was consented to, this provision was written into the Constitution, that Congress could not by any regulation of commerce discriminate or give preference to the ports of one State over those of another; and the Supreme Court in construing that provision has said that it is an inhibition against Congress passing any law or regulation of commerce or revenue that prefers the ports of one State over those of another.

Gentlemen, you may vote this amendment down, but you vote down the very words of the Constitution put in there to protect the people in an emergency like this; that is, that Congress or a department, even though it be the Department of Agriculture, can not by an order or regulation for revenue or commerce say that any article shall come into a port of New York, Boston, or San Francisco that can not go into the ports of Georgia, North Carolina, Mississippi or South Carolina.

Mr. Chairman, as a part of my remarks I submit parts of a letter from the chairman of the Horticultural Board.

UNITED STATES DEPARTMENT OF AGRICULTURE,
FEDERAL HORTICULTURAL BOARD,
Washington, D. C., January 18, 1915.

DEAR SIR: You will find inclosed a statement giving the present situation in relation to the pink boll worm, and outlining the action which will probably shortly be taken by the Department of Agriculture to prevent the establishment of the pink boll worm in this country. I will be very glad to receive from you any suggestions which you may wish to make.

Yours, very truly,

C. L. MARLATT,
Chairman Federal Horticultural Board.

PROPOSED ACTION TO PROTECT THE COTTON INDUSTRY OF THE UNITED STATES AGAINST THE PINK BOLL WORM.

A public hearing was held at the Department of Agriculture, Washington, D. C., May 15, 1914, on the three following proposed orders restricting the entry, movement, and utilization of foreign lint cotton, including Hawaiian cotton, with the object of preventing the introduction of the pink boll worm into our cotton-producing States.

(1) An order placing restrictions on the importation of lint cotton such as apply to the importation of nursery stock, so that the entry of such cotton may be limited to the Northern States. (2) A proposed quarantine order regulating the movement of imported lint cotton from Northern States to cotton-growing States. (3) A quarantine order proposing to restrict the movement of Hawaiian cotton to certain Northern States.

Action has been deferred on these orders to obtain fuller information in regard to the utilization of foreign lint cotton in southern mills, and to give practical trial to a plan proposed at this hearing of daily burning all picker waste from such cotton as a possible means of preventing the establishment of the pink boll worm. Tests have also been made of certain suggested means for disinfecting baled cotton. The results of this investigation, summarized below, indicate the need of promptly placing foreign lint cotton under the restrictions substantially as proposed at the hearing of May 15 last, and this notification and explanation of the action shortly to be taken is issued for the information of those interested.

EFFECT OF THE PROPOSED RESTRICTIONS.

The restrictions proposed and discussed at the public hearing of May 15, 1914, enumerated at the beginning of this announcement, now seems to be the only practicable method of excluding the pink boll worm from the United States. This action will place no important handicap on the importation and utilization of foreign cottons in the manufacturing districts north of the cotton-growing States. The admission of such foreign cotton, including Hawaiian cotton, under permit, will proceed as at present, but will be limited to special ports of entry, including the ports of New York, Boston, and San Francisco, through which practically all of the cotton now reaching the United States enters.

The proposed quarantine of certain Northern States into which foreign cotton will thus be allowed to enter is to provide means of regulating and controlling the movement of such imported cotton from the quarantined States to mills located in cotton-growing States. It is not contemplated to prohibit altogether the movement of such cotton to southern mills. The means of protection proposed is to require as a condition of such movement a period of storage of foreign cotton in northern warehouses for 24 months to make it absolutely sure that the insects which may be carried by the contained seeds have all perished. It has been experimentally shown with this insect, as with related species, that not all of the larvæ transform during the first summer following harvest and a certain percentage may therefor go over as larvæ to the second summer, hence the necessity of a 24-month storage requirement. This means, for example, that the Egyptian cotton, crop of 1914, would not be available for utilization in southern mills until October, 1916. The department is advised that foreign cotton is frequently kept in storage in this country for a considerable time, and it is therefore possible that the few southern mills which, from the nature of their trade, are dependent on this foreign cotton, can secure cotton which will meet this 24-month storage condition, and in the future provision to meet this requirement can be regularly made. Furthermore, it was brought out at the hearing that a sufficient quantity of long staple and Egyptian cotton is now produced in Arizonia and elsewhere in the South to meet any imperative need in southern mills.

The investigation of the use of foreign cottons in southern mills developed the fact that for the most part these cottons are not essential to the business of these mills, and most of the foreign cotton so used is of inferior grade and purchased simply because of its low market price. There appears to be but one large southern establishment whose output necessitates a good grade of Egyptian cotton.

Whatever hardship may be worked to the southern manufacturers by these restrictions will be vastly more than offset by the prevention of the entry of an insect which, from its record, would probably prove fully as disastrous as the boll weevil.

C. L. MARLATT,
Chairman Federal Horticultural Board.

JANUARY 18, 1915.

For a Fair Investigation of Personal Rural Credit Bills.

EXTENSION OF REMARKS

OF

HON. SILAS R. BARTON,

OF NEBRASKA,

IN THE HOUSE OF REPRESENTATIVES,

Tuesday, March 2, 1915.

Mr. BARTON. Mr. Speaker, of all the do-nothing attempts of any legislative body I ever heard of has been the efforts of the Sixty-third Congress on rural credit. It has created two rural-credit investigating bodies; one took a junketing trip to Europe and reported a poor land-mortgage bill and said that personal credit could "best be enacted by the various State legislatures." The other was composed of members of the two banking and currency committees, known as the Rural Credit Committee. It, too, reported a land-mortgage bill, which was an attempt to bind the farmers to the Federal Reserve Board, a

body which will for all time to come be dominated by bankers. But it failed to report a bill on personal rural credit, a system which has been tried for years in most European countries and proven most beneficial to the agricultural interests of those countries.

There are four resolutions now pending in Congress, one (S. J. Res. 232) introduced by Senator MORRIS SHEPPARD, and House joint resolutions 416, 417, and 430, introduced, respectively, by Mr. CANDLER of Mississippi, Mr. DOOLITTLE of Kansas, and Mr. HELGESEN of North Dakota, each being identical, and which provide for the creation of a commission before which farmers or associations of farmers may appear by their own experts with bills and prove them up during vacation, so as to have a bill or bills for the consideration of Congress when it convenes in December next.

Those resolutions provide the only means by which our farmers can hope to secure sound personal rural credit legislation, as it means an open investigation, and the farmer has everything to gain and nothing to lose by an open investigation of this subject by his own selected experts. How different this investigation would be compared to the monetary investigations conducted by the Sixty-third Congress. The chairmen of the committees selected the witnesses to establish their own theories and employed experts at Government expense to aid them in that effort. How is it possible to obtain the truth under such a method as that? It is silly to expect it. If we do not have a plan of investigation as is proposed under these resolutions for personal credit, the American farmer will never secure any legislation worth asking for.

It is gratifying to know that there is an attempt on the part of private initiative to enable the farmers to secure this fair plan of investigating this important subject, and the only hope for the country is for the rural press to take it up and keep at it from the adjournment of this Congress until the convening of the next and urge the people of the rural districts to ask their Members of Congress why they can not give this method of investigation to the farming interests. If the rural press will take it up and keep at it, the farmer will secure this investigation, and with a proper investigation nothing can prevent him from securing a sound and practical personal rural-credit system.

Mr. HELGESEN sets out in his resolution strong argument for an investigation along this line. He says:

Whereas none of the several rural-credit investigating bodies appointed by Congress within the past few years has drafted a personal rural-credit bill; and

Whereas personal rural credit is more necessary than a land-mortgage system, although such system is good so far as it goes; and

Whereas nearly every highly civilized country has in successful operation a personal rural-credit system through which the farmers of those countries obtain credit for productive purposes at low rates of interest and in sufficient amounts to enable them to produce agricultural products more economically than is done in this country, even though our farmers possess many natural advantages not enjoyed by them; and

Whereas the great European war now being waged is wasting capital at a rate never before approached, which condition is bound to result in materially effecting the world's capital and credit markets; and the American farmers having no organized credit machinery, it naturally follows that their interests will suffer more than any other interests in the country and make it more difficult for them to obtain credit in the future than it has been in the past; and

Whereas the function of a body to investigate a scientific question like credit is judicial in character and not legislative in any sense, because its chief mission is to ascertain the truth to form the basis of sound legislation, just as it is the mission of the court to ascertain the truth to form the basis of its judgment, and the function of an investigating body being judicial in character, it follows that "its machinery should conform to that of other judicial bodies, which provides that the interested parties may appear in open court and establish the merits of their respective contentions, and if the selfishly interested parties are brought into court to fight out their own battles in an orderly manner and on fair terms prescribed by the commission, then the Members of Congress would not be charged with representing any special interest: Therefore be it

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the Committees on Agriculture of the Senate and House of Representatives are hereby authorized, through a subcommittee, to investigate and hold hearings on such personad rural-credit bills as may be presented to them, in the manner hereinafter more specifically set forth, and make a report thereof not later than the 10th day of December next.

It is a farmers' farm credit and personal legislation we desire, not a bankers' bill. The criticism of Democrats like Mr. HOWARD, Mr. WINGO, Mr. BATHRICK, Mr. EAGLE prove to my mind that an honest effort has not been made, and will not be made if bankers are permitted to dominate the legislature. This body has already favored the big bankers in their Federal reserve act, why now turn the system of farm and personal credit over to them?

I predict that the farmers will demand a bill that cuts out bankers and middlemen margins, and legislation that will give them relief from their present condition of annually, semi-annually, in season and out of season, paying all their profits out in unjust payments.

The Sixty-third Congress.

EXTENSION OF REMARKS

OF

HON. SIMEON D. FESS,

OF OHIO.

IN THE HOUSE OF REPRESENTATIVES,

Wednesday, March 3 (legislative day of Tuesday, March 2), 1915.

Mr. FESS. Mr. Speaker, I have exercised my right, as I view it, to act the part of a Member of this House—to vote on every measure in accordance with my judgment. I have thus found myself at times supporting a bill brought into the House as an administration measure. From the very outset I promised myself not to oppose any measure which my judgment would approve simply because it was made an administration measure.

When the Federal reserve act was before us, I saw many good features, which I readily admitted in a speech on the floor of the House. There were in it objectionable features, which ought to have been omitted, such as the partisan feature of the board, which, in the hands of men willing to use it for partisan purposes, is serious; and other features, the possibilities of dangerous inflation and the dangerous redemption clause which could have placed the country upon the silver basis. When amendment preserving the gold standard, offered by myself, was accepted by the House, I agreed to vote for the bill, notwithstanding the other features I disliked. I did this with my eyes wide open to the facts that under the old law our country had made the most wonderful progress known to man. But the old law had some features that needed correction, and in the belief that the reserve act was largely copied after the recommendations of the Republican Monetary Commission, I voted for it.

THE MEXICAN SITUATION.

The President's refusal to recognize Huerta, because he had not come to the presidency in a constitutional manner and had not been able to maintain a state of order, had some influence upon me. In that extent I was in accord with him. In addition to these reasons, the complication growing out of the possible legal entanglements of a recognition on the matter of validating obligations of Mexico to other countries was with me a serious matter. I did not then, and do not now, believe President Wilson can be justified in his promulgation of the decree that at an election Huerta can not be a candidate. I did not then, and do not now, believe he was justified in the decree to Congress that "Huerta must go." I did not then, and do not now, believe he was justified in virtually becoming an ally of Villa in his efforts to expel Huerta. I did not then, and do not now, think the country will ever indorse the refusal to lend protection to our citizens in that country who were left to the alternative of relying upon the issues of the sword or to take refuge under foreign flags. The country can not reconcile the President's denial of Huerta's position as head of the Mexican nation with his command to him to salute our flag as an apology. These were steps which I, with other Republicans, deplored and criticized; yet when our troops were landed on foreign soil at Vera Cruz it was an act of war on our part. Believing that all partisan criticism should cease at the international line, I supported the President and asked from the floor of the House my Republican colleagues not to repeat the mistake of the Democrats in 1898 when they assaulted President McKinley for his inaction at a moment when the country was in acute danger. But this position does not indorse the landing at Vera Cruz as a mere opera bouffe. It did not mean a march up the hill in order to march down again.

The country wants to know why the landing was made. It asks whether it would have landed on British, German, or French soil? If not there, why on Mexican? The country wants to know what was gained by the death of a score of American soldiers, 200 Mexicans, and an expenditure of more than $15,000,000. Surely, if the only Government known in Mexico is vacated by order or assistance of our Army, then we have made ourselves responsible for what follows. Did the administration propose to meet such a contingency?

Is the country to understand that the President stated his final policy at Indianapolis when he insisted Mexico has the right to spill as much blood as she cares to? If so, I doubt the wisdom of it.

INTERSTATE TRADE LAW.

The interstate trade bill and the bill for regulating the issue of stocks and bonds I supported. They were recommended by Taft and are Republican measures. But I do not indorse the

extreme partisan character of the Trade Commission just named by the President. To me it is not reassuring to place the business of the country under the control of men whose principal activities known to the country are as party managers. The appointment of the secretary of the Democratic national committee, conducting a campaign in which the main issue was business heckling, may please the Democratic managers, but must be looked upon with seriousness by the average citizen of our country, and especially by those responsible for the country's investors of capital and employers of labor. This seriousness is not relieved by a close scrutiny of the rest of the commission.

BUSINESS HECKLING.

I supported the Alaskan and the conservation propositions of this Congress. But I opposed with all the vigor I possessed the Underwood bill; I opposed the Clayton bill and gave my reasons. I would not vote for any law that denies equal protection under the law to all men alike, not especially when it is offered as a sop for votes.

CANAL TOLLS.

I opposed the Panama tolls proposition because I refused to surrender our control of that gigantic enterprise, the greatest achievement of engineering known to mankind, for which we paid nearly $400,000,000, to any foreign country.

OUR INTERNATIONAL RELATIONS.

In the matter of our relations with Europe, I pointed out February 18 our most acute situation, as it appeared to me, growing out of neutral rights. I also pointed out the remarkable similarity of the years immediately preceding the War of 1812 with the present time since the 1st of last August. In my judgment, from the viewpoint of the past, the administration has the most critical situation facing it since 1860. We are in the midst of events that are fraught with possibilities which are alarming to say the least. The retaliatory measures of both sides will affect the United States most of all. We may be called upon to lay an embargo as a retaliatory measure, as was done in 1807 by Jefferson. In that case dire distress will follow and widespread disaffection among our people will ensue. In addition, such an embargo will be regarded by nations, especially the allies, as an unneutral act.

The present situation will require the highest type of diplomacy to avoid the calamity of war. The administration will have the support of all parties in its effort to avoid such a fatality.

This situation loudly demands caution on all movements of international significance. It certainly will avoid the possibilities involved in the proposed ship-purchase bill.

THE SIXTY-THIRD CONGRESS.

But, Mr. Speaker, many distinguished gentlemen grow eloquent in their recital of what they are pleased to term the achievements of the notable Democratic Congress just closing. To say the least, it takes a peculiar type of mind to applaud a program of legislation which within less than two years—to be exact, but a year and five months—has transformed a people happily employed and universally enjoying the fruits of the Nation's greatest era of prosperity to a state of distress that is taxing to the utmost extent the altruistic character of our people as in no other period in its history. If it be the province of Democratic Members to call the country's attention to what they style a notable Democratic Congress, surely no one will deny to a Republican his duty to note the reasons for the title. Two years ago the press carried the daily story of national achievement as written in the transactions of an independent people; independent because they were not seeking relief from charity organizations. In the campaign of 1912, when the Democrats promised free trade, our people were warned of the inevitable results. To-day, after one year and six months of free-trade legislation, with a banner year of nature's production, the front page of the daily newspaper portrays the task of church, employing every agency at its command; municipality, by issue of bonds for public works; and charitable associations, in attempts to relieve suffering by resorting to the employment of soup houses, bread lines, and lodging stations in every great city.

In the face of immediate suffering, the direct result of a program of legislation, all of which was predicted as an inevitable result of an abandonment of protection, a suffering that was not only predicted by Republican Members but pointed out by unerring argument, these Democratic orators continue to remind the country of this notable Democratic Congress. In the light of conditions incident to the work of the Congress, one asks whether there is anything that could possibly embarrass our Democratic friends.

ITS PARTISAN CHARACTER.

In a sense these men are correct in their title. No one will deny that this Congress is notable for its partisan character. It is notable in this regard, since this feature was unexpected from one of the type of the President. To begin with, it is headed by the most intense partisan since the days of Andrew Jackson. This is a surprise to the country, since the writer of history is usually looked upon as impartial to the facts of history. The President is not only giving an intense partisan administration, but a most arrogant treatment of a coordinate branch of the Government. No one will seriously deny that the Congress is but an echo of its head, which, in this case, is not the Speaker or floor leader, but the occupant of the White House. It moves and lives and has its being in Woodrow Wilson. The jitney line between the White House and Capitol Hill is not needed. Congress has virtually abdicated. It begins and ends in the White House. Even such independent Members as the chairman of the Appropriations Committee [Mr. FITZGERALD] admits that the House is but a ratifying body in matters of appropriation. The executive department hands down the estimates, and Congress as a matter of form applies the rubber stamp. He should have gone further and confessed that the Congress has ceased to be an integral department of government. We hear of a command to pay $25,000,000 to Colombia. The order is given to the Senate. The House, which must originate measures to pay money, was not even consulted, but contents itself with the function of a rubber stamp with the "Wilson" imprint, and in such a case does not even need to apply the stamp.

EXECUTIVE DOMINATION.

It is Wilson that initiates. It is Wilson that terminates. It is Wilson that says "go." It is Wilson that crys "ho," and Wilson that orders rest between heats. Most of the legislation of the Sixty-third Congress wears the well-known brand "'Tis Wilson, that's all." To the Senate he gives orders to pass a ship bill. Opposition to it is classified in a public address delivered to an Indiana audience but directed to the Nation—"Some misguided, others blind, but most of them ignorant." After the most determined opposition in the history of legislation, led by the Republicans, assisted by seven Democrats who insisted on their right to think, by order of the White House it was transferred from the Upper Chamber to the "House of Wilson" and ordered passed under a rule denying the right of amendment, permitting six-sevenths of one minute to each Member to discuss a measure at once revolutionary as a national issue, since it proposed to launch the Government into an enterprise which private capital had not successfully entered, and acutely critical as an international step because it proposed to send a Government-owned ship upon the sea at a time when half the world was in arms. The six hours allotted for discussion were interrupted by a dozen roll calls in a vain endeavor to compel absent Wilsonites to hear discussed the folly of their servility. There was as much time consumed in this way as in debate of the measure. Minds foreclosed by Executive orders are not subject to strong convictions. Why any debate? Why the sham, the opéra bouffe? Condemn in the cloakroom and vote approval on the floor. Time is called; debate closed; vote ordered; bill passed; in a body of 435 Members, many of whom involuntarily sacrificed all self-respect as well as conviction in order to avoid the charge of independent thinking, and all done in letter-perfect form by a House that to-day boasts of its history. What the Senate considered day and night for four weeks the House in a day neatly wrapped, carefully tied into a bundle, and obediently handed back to the Senate for further orders. The Senate rests until ordered to resume. Not even Jackson's time knows of such performances; and it is said by the historian he ruled as a Cæsar for eight years. Jackson was partisan from impulse; Wilson from political theory.

WILSON AS A PARTY LEADER.

If Jackson thus ruled eight years, it is pertinent to propound the query, "How long will Wilson rule?" Jackson believed himself responsible to the Nation, because he as President was the head of his party. Wilson regards himself responsible to the party, because he as a Democrat is the head of the Nation. Note his words:

> If any group of men should dare to break the solidarity of the Democratic team for any purpose or from any motives, theirs will be a most unenviable notoriety and a responsibility which will bring deep bitterness to them.

When he declared the Republican Party had not had a new idea in 30 years the public were inclined to accept it as a petulant utterance. The language was so unlike its author, and especially the President of the country. But he reminds the country that he speaks not as a politician but as a historian. This preposterous statement, which blindly ignores the country's era of greatest achievents, is quite in keeping with his treatment of the minority party in all matters of legislation in the Sixty-third

Congress, and is but a commentary of his political theory as expressed in his prior utterances on party government.

PARTISAN TENDENCIES.

It throws light upon the assault upon the civil service by one who has been for years a member of an association whose sole purpose was to prevent such assaults. It explains the star-chamber sessions of the majority members of the committees while considering great measures of no partisan significance. The procedure was based on the theory that the minority had no ideas worth considering. The Federal reserve act, based upon the Republican Monetary Commission's recommendation, was first handmade by the Executive, then passed over—not to the Banking and Currency Committee, but to the Democratic members of that committee, who excluded both Republican and Progressive members from all proceedings upon the basis that the majority members desired to caucus on the matters.

When the Democratic Members were sufficiently coached they called the caucus and steam rolled the bill through, after which it came to the House with the Executive stamp, with orders to pass it without amendment. The subserviency of the House on this, as upon all other measures, is emphasized by contrast with the procedure in the Senate, where some independence still obtains.

CAUCUS LEGISLATION.

The RECORD of this Sixty-third Congress as it affects the country is but an expurgated copy of the minutes of the Democratic caucus. Legislation is not an open-forum performance, it is a secret-caucus ex parte proceeding. Each measure bears the same earmarks.

(1) Executive handmade bill. Prepared in the White House, frequently by men with no legislative function or experience. Sent down to the Congress.

(2) Perfunctory consideration by Democratic members of the committees. This in order to fall within the rules of the House for introduction of bills.

(3) Caucus order. This not for the purpose of discussion, but quite the contrary—to prevent it. To bind and gag an unwilling minority of the majority, thereby controlling 435 Members by 146 Democrats.

(4) Special rule to gag the House. This to prevent all amendment and limit discussion so as to obviate exposure of gag methods.

(5) The steam roller in motion. The farce of the pretension of legislation when it is mere ratification.

This tells the story of the enactment of the administration measures.

CASES CITED.

The country needs but acquaint itself with the method of the enactment of the Underwood bill. The Democratic majority proposed 20 per cent on wool and a retention of a duty on sugar, but the White House ordered it otherwise, hence they go on the free list. This is but a recital of the story of the Federal reserve act, the tolls-repeal act, the Clayton Antitrust Act, the war-stamp act, all steam rolled through the House with but one conductor and no one needed to keep a clear track.

The ship-purchasing act, hauled through the House in a single day, after it had been held up in the Senate by aid of Democrats, is the most striking example of one-man legislation through men who "recognize their master's voice," of the many similar cases in this "notable Democratic Congress."

GAG RULE IN OPERATION.

The special-rule method of legislation, which in 16 years of Republican administration was employed but 110 times, in this single Congress has been resorted to over 60 times. In Republican times it was resorted to as an exception, in Democratic times as a rule.

The Democratic character of this legislation is shown in the assaults upon the civil-service or merit system, which has been undermined and which is rapidly being superseded by the old "To the victor belongs the spoils" system. It did it in the income-tax law, again in the deputy revenue collectors, again in the United States marshals, and Post Office Department. This administration, headed by a member of the United States Civil Service Commission, has stamped its disapproval of the merit system upon every administration measure. This extreme partisan character of the administration is not confined to the utterances of the President and his spokesmen. Strong opposition was offered to the Federal Reserve Board on the ground of partisan bias. It is well to note how it is displayed in the personnel of this board as it was finally constituted. No more flagrant violation of this privilege could be made than to choose a board of seven, all of whom were Democrats. In the Interstate Trade Commission just appointed we see the same abuse, where on a commission which by law must not have more than three members of the same party there is not a single Republican. But this is not the serious feature. The political activity of at least three of the five members as campaign managers in an election where the issue was persecution of business men, in which the country's industries were pilloried by the demagogue, who attacked men who had won success, makes the possibilities of this partisan commission a serious fact. Surely no Republican would care to share the odium that must inevitably abide with a program that is filled with such fatalities. The country's enterprises under the control of a commission of political workers unacquainted with business is a policy that should be viewed with great concern.

PROSTITUTION OF THE DIPLOMATIC SERVICE.

The universal displacement of men trained in the Diplomatic Service of the country and serving the Nation with distinction, especially in Central and South America, by men whose only claim to recognition is partisan loyalty to the Secretary of State in the many campaigns conducted on his behalf, is a shameful prostitution of our Diplomatic Service which should be condemned by all citizens, Democrats as well as Republicans.

The most recent information on this angle of the notable character of this administration is the Vick letter of Mr. Bryan seeking vacancies in Santo Domingo for "deserving Democrats."

THE UNDERWOOD BILL.

This Sixty-third Congress may well be styled both Democratic and notable, first, because of the Underwood bill, the first performance on this program of national disaster. This measure was brought into the House on the 8th of April, 1913. Its author promised four things—(1) reduce the cost of living, (2) not to disturb business, (3) increase our foreign trade, (4) and raise revenue sufficient to run the Government.

On the 25th day of April, 1913, while this bill was under discussion, I said on the floor of the House in the first two minutes of my address in opposition to the measure, which could have but one effect:

> If this Democratic measure goes into effect, there certainly must be a reversal of public opinion, and it will as certainly come in a very short time—just as soon as the people can register their will. My judgment is that few things will be more sought after than a chance to vote.

This statement was made in the light of what had occurred in 1894, when the McKinley bill was repealed by the Wilson bill. This Underwood bill was passed in the House 15 days after the statement was made. It went to the Senate, where, after discussion for five months, 672 amendments were made. It was signed by the President October 3 and became a law the next day, the 4th of October, 1913. By the end of this Congress it will have been on the statute books one year and five months. What about the prophecy of the wish of the people to vote?

There may be some suggestion in the election of the 3d of November last, the real significance of which lies not in what was actually accomplished by the Republicans, but by the nearness with which they came to revolutionizing matters in the country. A Democratic majority of 145 was wiped out, with but a margin of 29 to go on in the rest of this administration. Prior to the 1st of August, before the war in Europe broke out, and before the Democratic leaders could claim the war as relief from the fatality of their folly, the records of the country's business will tell the story of the effects of the Underwood bill. Industries paralyzed, labor unemployed, capital uninvested, balance of trade against us, loss of gold to Europe, Treasury embarrassed. Nothwithstanding those records, which were constantly kept before the country by frequent recital from the floor of the House and Senate, to the utter discomfiture of the administration, Democratic Members of this House are heard to attribute the distress of the Nation to the European war. At first they denied the statement of fact of real conditions. Then they minimized the effects. Later, they attempted to explain them. It was a conspiracy to discount the Underwood law. Then it was placed on the failure of the Interstate Commerce Commission to allow an increase of rates. Then it was the abundant crops that clogged the markets. Finally, in May, the President explained it as merely psychologic, and on January 8 he pronounced it a state of mind. But the war by unanimous consent of Democrats has been voted as the best Democratic excuse and explanation of this Democratic legislation.

PROMISE VERSUS PERFORMANCE.

It is folly to ask whether the promise to reduce the cost of living was kept. What about our business, domestic and foreign? The first seven months of the Underwood bill, and that was before the war, saw a loss to American labor and capital of a quarter of a billion dollars. We imported $122,000,000 more and exported $126,000,000 less. Every dollar's worth of goods imported and every dollar's worth of goods we failed to export was so much loss to American labor. In these

months this legislation favored the foreign producer and cheap laborer by this sum, displaced from American enterprise in favor of European a sum that would have employed three quarters of a million men at $2 per day for the seven months. You can not buy an article from Europe, and at the same time the same article from America. If from Europe, we employ European labor. The very purpose of the law was to open our markets to the foreign producer. This is but one expression of the choler of this administration toward American enterprise.

RESULTS PREDICTED.

This direful condition was foreseen by Republicans, who declared it to be inevitable. They pointed in specific terms and figures what must follow such legislation. The reply to such declarations was made by its author, Mr. UNDERWOOD, in his famous threat that a Bureau of Foreign and Domestic Commerce, created for the purpose, would investigate any firm that would either close its doors or reduce its labor, either in time or wages. Behold, what a commentary upon that boast is the situation now, with every feature of industrial America prostrated until the demands of war-ridden Europe partially relieved the situation; with banks breaking, firms going into receiverships, with dividends passing, the President, on January 8, congratulated the country that banks were not embarrassed by paying dividends. What a comment. In the light of it, the personnel of the Trade Commission may be studied.

INSIDIOUS LOBBY.

Another item may here be examined. During the discussion of the Underwood bill, men whose very business existence was hanging upon the caprice of the legislator who, too often, sought popularity by crying out against those who had achieved success, these men of affairs who came to the Capital to seek a hearing upon proposed legislation by men who had, to say the most, the slightest ideas of the business they proposed to deal with, were stigmatized as a part of an insidious lobby. A Congressman must be protected from the temptation of influence. His knowledge of details of tariff legislation is sufficient and he must not see others; hence the fiasco of an investigation was ordered by both Senate and House. The Senate report is in innocuous desuetude, while the House found one Democratic Member worthy of chastisement for conduct not connected with the bill in question. We were told that any man who came to protest against this business-wrecking legislation was evilly disposed; that every Member who fought it was under the influence of the interests as against the people. The administration proposed to separate politics and business by destroying the latter by the former.

DEMOCRATIC.

In at least two items the title of this Congress claimed by the Democrats justify their contention. Its partisan character justifies the label "notable." It could well be styled a Government of Democrats for Democrats and by Democrats. Its paralyzing effects upon the country in every department of labor and capital distinguish it as Democratic. Let us specify:

It is Democratic in the sense that it wears the Wilson label. Not because that is Jeffersonian, but because modern Democracy has lost its former anchorage and is to-day absorbed in a political personality.

It is Democratic in the sense that the legislation was inspired by a pronounced and well-defined antagonism to American enterprise—opposition to business success and persecution of those who achieve success. Consult the campaign slogan of 1896 to 1915. Note the drift to socialism. Note the character of debate on the Underwood bill, also the business-distracting Clayton bill, also the character of debate on the currency bill, the attitude both in word and act of the President, and especially his last act, the Trade Commission.

It is Democratic in the manner of carrying into effect business-heckling legislation. No one seriously believes that the Clayton law will be enforced, but a mere sop to appease a class of voters quite numerous. This law rigidly enforced would open the penitentiary to most men who are in business, no matter how careful they might be.

It is Democratic in its nation-wide effect upon all classes of people. It is impossible to harm the producer without hurt to the consumer. You can not help the employee by harm to the employer. Legislation to hurt the business man without harm to all others is the merest demagogy.

NOTABLE AND DEMOCRATIC.

It is both notable and Democratic in that it abandons protection to embrace free trade; it surrenders the American market to the capture of European goods; it displaces American high-paid labor in order to employ European cheap-paid labor; it discourages American capital by destroying American investments for the sake of the foreigner.

This Sixty-third Congress is both Democratic and notable in that, true to its history, it reduces the output of the producer and thereby increases the cost to the consumer; it lowers the price paid to the workingman for his labor and increases the price paid by him for his living; it decreases his ability to sell his labor and increases his disability to buy bread; it transfers him from the mill to the street; it substitutes for steady employment at good wages, with which to maintain the American standard of living, the curse of enforced idleness and the inevitable soup house and bread line of Democratic times.

This Sixty-third Congress is both notable and Democratic in that it has adopted a revenue policy which prior to the outbreak of the war increased imports and decreased revenue; that is, it increased the sales of the European producer and decreased his burdens for the privilege of selling, while it decreased the sales of the American producer and increased his burdens in supplying revenue.

"REVENUE ONLY" LEGISLATION EXPENSIVE.

The free list removes the obstacle from the foreigner and places it upon the American. Our revenue depends upon duty paid upon imports; goods on the free list bear no such burden. Wool is ordered on the free list by Executive decree, hence a loss of $15,000,000 revenue on this alone. The American woolgrower discriminated against, his flocks and fleece decrease, the price of woolens, in the control of the importer, increases to the consumer, and the loss of revenues, heretofore paid by the foreigner, now paid by the American.

Sugar, by the same order, goes on the free list; the American sugar producer discriminated against, domestic production decreases, price to the consumer increases, the loss of nearly $60,000,000 of revenue, heretofore paid by the foreigner, now paid by the American.

THE DEMOCRATIC DEFICIENCY STAMP ACT.

This Congress is notoriously Democratic, in that it relieves the foreigner from paying this revenue by placing it upon our own people in the form of a stamp tax, and that, too, under the Democratic and demagogic pretense that they are legislating for the people. This Congress stamps its character in its abandonment of Republican protection as a revenue producer, which places the burden upon the foreigner, for the Democratic free-trade scheme of the peaceful war tax, which is a deficiency tax fastened upon our own people.

It thus surrenders a system of taxation that not only supplies the necessary revenue to run the Government, but enough to complete the most gigantic engineering enterprise—the Panama Canal—known to man, by paying for it out of current funds, for a system of free trade that not only fails to supply the necessary funds to care for current expenses, but which resorts to the infamous stamp tax—of $90,000,000, deceitfully and dishonestly styled war tax—a system that within less than one year and five months after its adoption sees the magnificent Republican balance of over $100,000,000 in the Treasury almost wiped out and an actual deficit from this date in March of 1913, under a Republican law, of $87,000,000, notwithstanding the war tax of $90,000,000 of but five months ago. In the face of these startling figures what sort or brand of courage does it require to still speak of any Congress with such a record with pride? It is that brand which is spelled with four letters.

EXPLANATIONS, EXCUSES, AND APOLOGIES.

This Congress is both Democratic and notable for the explanations, excuses, and apologies now offered for the universal disaster their legislation has caused. The country has not forgotten the hue and cry of the former free-trade period of 1894 to 1897. It is also both Democratic and notable for the remedies we now hear proposed. It is too soon to forget the 16 to 1 nostrum of the present Secretary of State in 1896 as a remedy for the folly of the Wilson bill. The voter will not forget that relief from Democratic soup houses and bread lines was the repeal of the Wilson bill and the enactment of the Dingley bill of 1897.

STRIKING INCONSISTENCY.

It is Democratic in the sense that it strikes to earth American enterprise, and that after the warning had been thundered at them when the blow was delivered, and then investigates why it does not get on its feet. It is both notable and Democratic when it takes away from labor its employment, and then sends a commission headed by an advanced type of this prejudiced administration in the person of one Walsh to ascertain why men are not at work. Could any further evidence of virulence against business success be adduced to gauge the purpose of present-day Democracy? His socialistic nostrums and "embezzled fortunes" are head lines to recommend the Democratic character of this administration to the country. But what would the fathers say could they read modern Democracy in the light of such representatives? It is Democratic in its

campaign of substituting the soup houses, the bread lines, the lodging places, the altruistic organization, to feed and clothe the distressed, for a system of American industry that gives employment at good wages to everyone who desires to work. It is Democratic in that it proposes charity instead of work, a Federal employment bureau instead of a mutual cooperation between labor and capital under a system of protection that would guarantee a reasonable profit to the employer and good wages to the employee.

It is Democratic in the theory that it can substitute psychology for prosperity, that a state of mind can supply the needed diet for the empty stomach to relieve the pang of hunger, the necessary clothing to dispel the blasts of winter.

It is Democratic in the sense that its "watchful-waiting" policy has created a "wakeful-watching" period for the Nation. It is Democratic in the sense that national prosperity means Democracy out of business, while Democratic prosperity means the country out of business.

INTERVIEW WITH A CONGRESSMAN IS LOBBYING—INTERVIEW WITH THE PRESIDENT IS LEGISLATION.

A man who seeks a hearing upon a proposed business-distracting program is per se an undesirable and should be stigmatized as a lobbyist. The man who opposes the laws which must inevitably paralyze all enterprise is not to be permitted an audience with the Congressman who represents his district. It is Democratic in the sense that such branding is to be applied only when the hearing is sought with legislators upon the theory that the character of their position renders them unsafe from temptation; hence the necessity of the Executive order. The head of the Nation can safely receive at the White House the banking interests, headed by the Morgans, the railroad interests and various other industries headed by the captains, while the lobby committee holds its sessions on Capitol Hill. In other words, what lobbying is to be done, in this as in other matters, will be committed into the hands of the "captain of the team." This Sixty-third Congress is both notable and Democratic in the sense that business control is safe so long as under the guardianship of men who are free from business prejudice because they have never been in business.

ATTEMPT TO SET CLASS AGAINST CLASS.

It is notable and Democratic in that after a campaign which covered much of the time since the famous days of the Bryan 16-to-1 cure-all, a campaign designed to set class against class, to create prejudice against the frugal and the successful, a campaign in which the bloated bondholder, the swollen fortunes were the general objectives and the Standard Oil and United States Steel were the particular issues, the golden opportunity arrives. Loud were the charges against the interests on behalf of the people. The Underwood bill is the remedy against the bloated bondholder and owners of swollen fortunes. The Clayton bill is the cure-all for the Standard Oil and United States Steel. Every man who takes the time to study the Clayton law will see it does not prevent the evils it professed to cure, but gives the monopolist a greater hold by displacing the small competitor, a fact that was time and again pointed out in the debate.

BIG BUSINESS BEFORE AND AFTER.

In the light of this campaign for political purposes against "big business," it would be well to note the recent change of front, the ship-registry law and the war-risk law, the first permitting foreign-built vessels owned by Americans to have our flag. In this way the Standard Oil Co., the United States Steel Co., and the United Fruit Co. steamships, numbering at least 200, up to this time denied the use of our flag, because built in foreign shipyards with cheap labor in competition with our own workmen, by this Democratic Congress, which rode into power in a campaign at the head of which was carried the banner denouncing the Standard Oil, may now use the flag.

In this connection it is useless to quote the campaign speech of the leader of Democracy upon the free-tolls proposition in contrast with his Executive order to the Congress a few months later.

PARTISANSHIP IN FEDERAL COMMISSIONS.

It is Democratic in the determination that the banking resources of the Nation must be placed under the control of a board of seven, six of whom are Democrats. This, after the most telling assaults from Republicans in the House against the possibility of converting this money agency into a political committee. It is Democratic as well as notable in the character of the Industrial Commission, headed by Walsh, which explains the widespread conviction that the vital affairs of the Nation are not intrusted to men of either wisdom or balance. The possibilities for good are entirely lost by the irresponsible mouthings of its chairman; while every man of business experience is bending his energies to save the country from a fatality of business ruin, this governmental agency, headed by a vituperative and prejudiced individual, is adding to the distress. It is Democratic, in the modern sense at least, in consuming months to find a suitable group—that is, suitable to one man—even though it brings the time to within a few days of adjournment of Congress, when the Senate, which from the beginning of the short session, by Executive order, has been busy and has left but a few days to pass supply bills which carry over a thousand million dollars, is expected to ratify the appointments of the Trade Commission. If not, recess appointments will be made. This latest is both notable and Democratic. I quote an editorial of the New York Sun, an independent paper with Democratic leanings:

THE NEW BUSINESS BOSSES.

With the announced appointments to the Federal Trade Commission, the circle of commission government of business is completed. Presumably if the Senate refuses to confirm his nominations the President will make recess appointments of them. Then all our important economic activities within the constitutional reach of Washington will proceed under national control, the Interstate Commerce Commission running transportation services, the Federal Reserve Board running the banks, and the Federal Trade Commission running manufacture and commerce.

The Secretary of Commerce some time ago invented the phrase "mental mourning" to describe what was in administration eyes a reprehensibly depressed business attitude toward the political creations of the new freedom, but in his choice for the Federal Trade Commission President Wilson has made it just so much harder for corporate enterprise to recover confidence. It may be said that there is nothing very much against his appointees except that there is nothing for them, but is not that bad enough from the business point of view?

Even the business career of Mr. Hurley, on which so much emphasis is laid, is not enough to alter the fact that it is a typical new freedom commission, such as might have been expected to emerge from the source which discovered the astonishing Walsh and put him at the head of the United States Commission on Industrial Relations. Is not the caliber of the Federal Trade Commission as a whole measured by the inspired intimation that George L. Record, of New Jersey, was deemed fit for a place upon it and failed to obtain it only because the President's home State had already had a copious share of Federal patronage?

If the first impression which the new Federal Trade Commission gives is that it reeks with politics, the fact is not surprising. It expresses the very law of the commission's being. The only qualification respecting the appointments to the commission was that "not more than three of the commissioners shall be members of the same political party." Nowhere in the law is there the slightest suggestion that some or all of the commissioners should be men of business experience. The only statutory restriction regarding them is political.

The law creating the new body of business regulators had its origin in the realm of politics; it did not emerge from the facts and necessities of business experience as did the Federal reserve act. Politics of a nonbusiness sort tends toward antibusiness politics.

There is always the chance, of course, that the performance of the Federal Trade Commission may be better than the promise of its beginnings. This, however, is all on which the business community has to rely in seeking, as it must, to make the best of the fresh manifestation of the meaning of the new freedom.

Let the Washington Post, an independent Democratic paper, speak upon the personnel of these men who by the President's decree are to have control of the business of the country. If the Senate hesitates, adjournment leaves open the way for recess appointment which makes the President supreme. If the commission are chosen upon the theory expressed at Indianapolis, "I have never been in business and therefore have no business prejudices," the questions which would otherwise arise would be cleared up. The Interstate Trade Commission is a Republican recommendation, initiated by Taft and very largely supported by Republicans; but the personnel is not Republican; it is extremely partisan, not having a single Republican in the list. Its importance is suggested by the following editorial:

PERSONNEL OF THE NEW TRADE COMMISSION.

The salary of each member of the new Federal Trade Commission is to be $10,000 a year and the term of each, after the commission is fully established, will be seven years.

This is a longer term than is granted to any officials of the Government, with the exception of judges.

The salary is larger than that paid to Senators or Representatives or judges of the circuit and district courts. The judges who will pass upon the findings of this commission receive $3,000 each less than members of the commission.

The builder of the Panama Canal, Col. George W. Goethals, receives only $10,000 a year.

The only officers of the Government receiving larger salaries are the President, Vice President, Speaker, justices of the Supreme Court, and certain ambassadors.

Congress thus manifested its appreciation of the great importance of the Federal Trade Commission and the necessity of obtaining the services of the ablest men in the country as members of the commission.

It is no reflection upon the caliber of the men nominated as members of the new commission to remark that they are not in the same class with justices of the circuit courts of the United States or with Col. Goethals or with scores of Members of the Senate and House. They have not had the training and experience of jurists or business men of large affairs. Only one of them may be included in the list of first-class business men. Two of them have been filling subordinate places

in the Government service. The other two are unknown and untried, bearing good reputations and all that, but without other qualifications than are possessed by millions of average Americans.

And yet this commission, so constituted, is to be placed in control of American commerce. It is to wield powers greater than those conferred upon any persons in the United States, with the exception of the President and the Supreme Court.

Can it be possible that the President exhausted the list of really strong, able men in this country, and was forced to make this feeble and unsatisfactory choice?

We can not believe that an appeal was made to the patriotism of men who, by reason of their great abilities and wide experience, should have been selected. The Trade Commission, if successful, will evolve into one of the most potent agencies of the Government, and no man is so conspicuous or so able that he would not be honoring himself by sharing in the task of establishing the new tribunal. Surely the President could have found—surely he can find—the right kind of men to insure the successful operation of this commission.

The Senate should reject the nominations sent in, making it plain that such action is not in disparagement of the personal or business standing of the men who have unfortunately accepted the nomination. Since Congress set a high standard for the character and composition of the new commission, the Senate should insist that the members composing it shall be men of the first rank.

DISCRIMINATION LEGISLATION.

Is it Democratic to order enacted a discrimination law which makes an act a crime when committed by one set of men and a virtue when committed by another. This character of legislation discloses the extent of certain influences operating upon our public men, and is of serious import. It may be Democratic to pass a law that will compel every business man to be more concerned in keeping out of the penitentiary than in succeeding in business, and then to appease the employers of labor by insuring the national chambers of commerce at their recent annual session in Washington that this handicap to business should not be too rigidly enforced. Can it mean that the measure was so much sop to catch votes, and business need not fear because the law will not be enforced? I quote an editorial from the Washington Post purporting to give the interpretation of the law:

THE ANTITRUST HANDICAP.

President Wilson, in his speech before the United States Chamber of Commerce last night, plainly indicated that in his opinion the antitrust legislation had gone a step too far when he advocated its amendment in a way to permit cooperation among American merchants and manufacturers in the search for trade in foreign markets. Drawing distinction between a corporation and combination, the President remits none of his opposition to the formation of monopolistic trusts. He merely at this time declares that in his judgment the law is too rigidly restricting the enterprise of American producers and shippers by making it impossible for them to cooperate effectively.

The modification of the antitrust statute to this end is not likely for some time. If there is an extra session of Congress, precipitated by the present blockade in the Senate, the matter may be considered then, though, unless it is made an administration measure and pressed vigorously as such, it is of doubtful success in the circumstances. The President, however, might fully justify the calling of an extra session on this ground alone, if the antitrust laws do, in fact, put a handicap upon American producers in their search for foreign markets.

PROSPERITY BY FIAT.

When attention is called to this harrowing program and the country is loudly calling for relief in a demand to "revise the tariff, repeal the war tax, abolish the deficit," we hear in reply more psychologic remedies proposed, such as substitution for business sense the slogans, "Made in America," or "Buy it now," or "Buy a bale of cotton," or "State of mind." And all this within less than two years after the disastrous legislation was placed upon the statute books. During the debate upon this program of legislation and whenever a plea was made by a Republican—and it was quite frequent—that the proposed legislation would operate most disastrously upon all classes of our people, especially the laborer, both skilled and unskilled, the demagogic, ready-made reply was always heard, "You propose to legislate for the interests, but we propose to legislate for the people." Think of it! "Legislate for the people" by displacing American products by foreign products. Loud was the boast of our Democratic orators and statesman that they would reduce the cost of living. Note the manner in which they have kept that pledge. Also note the profound silence of the majority side of this House when the question is mentioned. The demagogic character of that pledge is equaled by its insincerity, for no man of responsible reasoning ability would hold that the high cost of living is due to the tariff. Democrats know as well as Republicans that the way to reduce the cost of living is to multiply the product. Republican policy looks to encouraging production, but Democratic policy seeks purchases abroad and thus discourages American production. Cost of living is not lowered when you discourage production by legislation against it.

Increase of production will result from stimulation, not from strangulation. Legislation that reduces the supply without reducing the demand inevitably increases the cost of living. Psychology will whet the mind if pursued in the classroom, but it is not a substitute for the law of supply and demand. This legislation was proposed to increase our foreign trade. It did increase our imports up to the time of the war, but it decreased our exports for the same period. That sort of increase of foreign trade, which augments what we buy and reduces the amount we sell, is vicious and un-American.

EFFECTS OF THE WAR.

Since the war our imports have fallen off as was to be expected, and our exports have increased, as was known by all who exercised any thinking power. I said at the outbreak of the war, "Any man with a thimble full of brains must know and will recognize that Europe, with her production disarranged, if not almost totally held up, will depend upon America to feed her." I pointed out that any industrial history of the United States shows that our export trade began in the Crimean War, back in the fifties, when five of the nations now at war were then in arms. The production of those countries being disturbed, our Nation was called upon to supply them. So will it be in this war. Until this Nation lays an embargo, her exports will be simply fabulous. Half the world in arms totally disarranges production among the warring peoples. That taxes the neutral countries to their very limit of production to supply the belligerent countries.

Whatever advantages this country's industries, its capital and labor reap, these are due to the war, and will not continue long after its close. The demands of those countries upon the productive energies of their people when the war is over will see Europe again the workshop of the world. Labor will be still lower in those countries after this awful cataclysm is over, and our country will see a competition in due time, with labor underpaid, that must not be overlooked and which will prove an additional reason for the repeal of a "revenue only" tariff measure which does not raise sufficient revenue. This means a speedy substitution of a protective system.

A DEADLY PARALLEL OF 1914 WITH 1894.

At various times I have pointed out the deadly parallel with the prior free-trade period of 1894–1896, or the Cleveland free-trade period with the Wilson free-trade period. Republicans reminded the country that the same argument used in 1893–94 on behalf of the Wilson bill was employed 20 years later on behalf of the Underwood bill. Twenty years ago the story was brief. Democratic control, the Wilson bill—1894–1897—American markets opened to foreign-made goods by cheap labor; paralysis of industry; business distress; an army of the unemployed; capital in hiding; imports increasing; exports decreasing; balance of trade against us; gold going out of the country to settle balances; deficit in the treasury; issuance of bonds (1895).

When this record is examined for light to interpret the present situation it becomes a deadly parallel. Democratic control; the Underwood bill; a lower rate than the Wilson bill; American markets open to foreign-made goods; American labor and capital displaced by foreign labor and capital; paralysis of enterprise; business distress; labor out of employment; capital uninvested; imports in seven months increased $122,000,000; exports decreased same period $126,000,000; loss to American labor a quarter of a billion dollars, enough to keep three-fourths of a million men employed the seven months at $2 a day; balance of trade turning against us; gold going out of the country on an alarming scale; deficit in the Treasury.

The next step should have been an issuance of bonds, but no! This administration deceived itself into the belief that it could hide causes by the use of names—hence, "War Tax."

This is a record before the war and can not be affected by it, since it came too late. Since the war imports have fallen off somewhat, but exports have fabulously increased. Even the war can not overcome the injury of this legislation.

THE PEOPLE CAN NOT BE FOOLED ALL THE TIME.

The people of the country are impatient with the politician. His attempt to convince them that business was good is resented. "Psychology" is not a satisfactory explanation of the loss of opportunity. No sort of subterfuge can reconcile the fact that in 1912 the country was at the zenith of prosperity under a protective tariff that not only protected American capital and labor, but that raised sufficient revenue to run the Government without resorting either to the issue of bonds or the levy of a direct tax to make up the deficiency produced by a vicious revenue measure, and insulting the intelligence of the country by calling it a "war tax," when the country was at peace with all the world.

The people will not forget that the same trick was attempted back in 1896, when the present Secretary of State, under the slogan of "16 to 1," assured the country that all our suffering was due to the gold standard, and proposed the free coinage of silver as the cure-all for the evils into which free trade had precipitated us. This time it is not the money question, but it is a European war to which we owe all our misfortunes.

As the people 20 years ago refused to be misled by political propagandists and returned to a protective tariff as a permanent remedy, so they will refuse to be caught up by high-sounding phrasing of "New freedom," "Emancipation of business," "Constitution of peace," and "Watchful waiting," and will again turn to the party committed to the principle of protection.

It is difficult to understand the credulity that could see in the European war distress to American industry. It is the one only item to save us from the blighting effects of a bill that not only paralyzed our home industries but suggested the iniquitous stamp tax as a remedy, which at best can be but temporary. The war, in the extent that it disturbs European production, annuls foreign competition with our labor, the very purpose of a protective tariff. In that degree it leaves the American market to be supplied by our own producers, and loudly calls us to the foreign market, now unsupplied by the European producer, whose ability is arrested, if not destroyed.

The people of this country will not be deluded by such appeals, and they will register their protest in no uncertain tone. The elements which in 1914 prevented it will not be present in 1916. The work begun in 1914 will be completed by 1916.

DEMOCRATIC EXPENDITURE.

This Congress will be notable because of its position upon economy. In 1912 the Baltimore platform charged Republicans with "profligate extravagance" and pledged the party to bring the country back to Democratic simplicity. The first year its appropriations reached over $100,000,000 more than any Republican year in our history. This was in spite of the fight for economy led by a Republican which saved the country $30,000,000 on a single bill. To-day in spite of an alarming condition of the Treasury, with a deficit of $87,000,000, when compared with the corresponding day in 1913 under protection, notwithstanding the stamp tax of $90,000,000 now in operation, we are told the Colombian treaty, carrying $25,000,000 and an apology must be entered upon. We are also informed that the country must appropriate another $30,000,000 with which to buy ships to enter upon a Government-owned merchant marine, at the moment when our exports are the largest in our history, which to say the least would indicate not a great lack of ships, and also at a time when the sea is mined, and war zones of the belligerents are extended, and many of our people clamoring for an embargo upon all goods as a method of stopping the war.

Mr. Speaker, some 20 years ago I came across some verses descriptive of those days. A slight change in the lines brings them down to date.

How dear to our hearts is the Sixty-third Congress,
When business intermeddling presents it to view;
The bill of poor UNDERWOOD, the anguish caused by it,
And all the wild fads that its verdancy knew.
The nation-wide sorrow, the wages lost by it,
The steam-roller process, whence self-respect fell;
Has split wide the country—Who dares to deny it?
And Democracy's hopes gone—where, pray, you tell.

CHORUS.

This "Wilsonette" Congress,
This "rubber-stamp" Congress,
This "revenue-only" Congress,
We all know so well.

The Baltimore pledges no one longer mentions,
For planks in a platform with sweetness are spread;
The high cost of living with no way to meet it
But points to the goal, to the realms of the dead.
How zealous we urged them with pleas overflowing,
With sulphurous blessings, as great swearwords fell;
The emblems of hunger, free-trade and new freedom,
Are sounding in sorrow the workingman's knell.

CHORUS.

This business-wrecking Congress,
This platform-breaking Congress,
This spoils-system Congress,
We all know so well.

How loud were their boasts that Democracy had triumphed,
Robber tariff protection no longer uphold;
Psychologic conditions—our dinner pails empty,
The factories silent, the furnaces cold.
And now, far removed from our lost situations,
The tear of regret does intrusively swell.
We yearn for Republican administration
And sigh for the Congress that served us so well.

CHORUS.

This "new freedom" Congress,
This "psychologic" Congress,
This "watchful waiting" Congress
We all know so well.

Some Members with the habit of plain speaking have suggested as a closing refrain for this notable (?) "Democratic Congress" the following:

This Sixty-third Congress,
This long-winded Congress,
This Democratic Congress,
We wish were in ——— well.

Rural Credits.

EXTENSION OF REMARKS
OF
HON. WILLIAM KENT,
OF CALIFORNIA,
IN THE HOUSE OF REPRESENTATIVES,

Wednesday, March 3 (legislative day of Tuesday, March 2), 1915.

Mr. KENT. Mr. Speaker, under leave to extend remarks concerning the rural credits bill, I herewith submit statement by Mr. David Lubin at the hearings granted by the Senate Committee on Agriculture on January 2, 1915.

Mr. Lubin is a great student of economics, with world-wide knowledge, and no subject is more intimately related to rural credit and the welfare of the agricultural producer than the plan which he advocates as a means of securing cheapened and nonwasteful distribution.

It will be noted that the proposed amended section 2 provides for a maximum salary of $6,000 for each of 18 commissioners. Some of those most interested in the measure believe that better service can be secured by such payment than by narrowing the field of candidates to those able to spend an adequate amount of time without compensation. Considering the benefit to accrue, the cost would be extremely small.

HEARING BEFORE A SUBCOMMITTEE OF THE COMMITTEE ON AGRICULTURE AND FORESTRY ON H. J. RES. 344.

UNITED STATES SENATE,
Washington, D. C., January 2, 1915.

Present: Senators GORE, NORRIS, FLETCHER, Representatives KENT, GOODWIN, and others; also Mr. David Lubin, delegate of the United States to the International Institute of Agriculture, Rome, Italy.

The subcommittee met at 10.30, Senator THOMAS P. GORE presiding.

The following House Joint Resoluition was under consideration:

Whereas it is patent that there are defects in the economic system of the United States which affect adversely the producers and the consumers of agricultural products; and

Whereas these defects have been accentuated by the present European war to a degree justifying the recent utterances of the President of the United States in the matter of the high cost of living; and

Whereas various attempts have been made from time to time to overcome these defects mainly through nongovernmental agencies, and recently under Governmental agency under the Bureau of Marketing of the Department of Agriculture; and

Whereas experience has, however, proven that the solution of this question is not to be found in nongovernmental agencies, nor is it to be found in a governmental agency. It is to be found in a semiofficial governmental agency, as is here proposed, as witness the success in the European countries of such a system, a system which has swept aside the trusts in food products and which renders the trust an impossibility; and

Whereas the present abnormally high prices for food products not alone offers an opportune time for the establishment of a semiofficial governmental agency as a means for the temporary solution of this problem, but also for the organization of the agricultural forces of the United States on the lines indicated as a means for the permanent solution of this problem: Now, therefore, be it

Resolved, etc., That the President be authorized and requested to appoint a national marketing commission to be composed of 29 members, 15 of whom shall be farmers, and 14 of whom shall be selected with reference to their eminence in commerce, law, finance, and transportation.

SEC. 2. That such national marketing commission shall meet in the city of Washington, at a time designated by the President, and organize by the election of officers; and adopt a plan of action for the effective organization of the States, counties, and localities in the United States for the economic distribution of the products of the farm, with power to act in so far only as affecting individuals and organizations that shall elect to become a part of this national marketing system.

The following House joint resolution 423 was suggested as an amendment by Mr. GOODWIN of Arkansas in place of section 2:

That the President be authorized and requested to appoint a national marketing commission, to be composed of 18 members, 12 of whom shall be engaged in agricultural or horticultural pursuits and 6 of whom shall be selected with special reference to their knowledge of commerce, finance, transportation, and law, and who shall receive compensation not in excess of $6,000 each per annum.

That said commission shall meet in the city of Washington, at a time designated by the President, to organize by the election of officers and to adopt a plan of action for the effective organization of the States, counties, and localities of the United States.

Said commission shall be empowered and directed to act with organizations and individuals as may become part of the national marketing system when such organizations and individuals may have been authorized by said commission to cooperate to that end and under such rules and regulations as the national marketing commission may prescribe.

The CHAIRMAN. Gentlemen, we will be glad to hear Mr. Lubin's statement on the resolution before us.

Mr. LUBIN. Mr. Chairman and gentlemen, that subject deserves at least a patient hearing, and I would therefore ask that all extraneous thoughts be put aside for the time being, so as to concentrate the mind on the matter before us.

I am under the impression that no subject can be presented for public action which can transcend in importance the one of the economic distribution of our farm products. This is a statement, an assertion, and it now becomes my duty to sustain this assertion. If I can succeed in placing this matter so clearly before your minds as

to merit your indorsement, I shall then have accomplished an important step forward in the progress of the work before us.

What, then, is this matter? Let me illustrate its importance from an incident. About a year and a half ago the American Commission on Rural Credits, when visiting at Neuwied, Germany, the monument to Raiffeisen, called on me for some remarks. I then made the statement that it seemed to me that there was one great, strong nation in the world, a nation that if put to the test would give irresistible evidence of its powers of resistance and endurance, and that this nation was Germany. I based this opinion, not on the fact that Germany was a powerful bureaucracy, not because Germany has drilled armies or a growing navy, but because she has the most scientific, common-sense way of caring for the distribution of her farm products, a system which excludes the possibility of placing these products in the hands of trusts.

So believing, I said in my remarks that "in so far as this has been accomplished to a greater extent in Germany than in other countries, in so far is it safe to say that the political life of Germany is more sound to the core, contains within itself a greater resisting power, than the political life of other countries."

So as to leave no room for wrong inference I explained at that time that these observations were not intended as a panegyric on the German Empire at the expense of the American Republic. The purpose of this statement was to bring out a truth, a truth which, when understood and applied, might prove profitable to the American people; a truth which would clearly indicate the value of adapting in the United States methods of scientific distribution of farm products on the lines of the German system of distribution, on the lines of the Landwirtschaftsrat.

During the past 10 years my labors in the International Institute of Agriculture have made me familiar with the facts I am treating of in this "hearing." As early as February, 1905, in a paper for the institute in Rome, I said: "The way to abolish detrimental trusts, combinations, and mergers is to prevent them from getting hold of the products of the farm in the first place." Then followed a suggestion for the adaptation of the Landwirtschaftsrat system, in the following words:

"The individual farmer would present his needs, suggestions, and desires to his local (township) commission. The local commission would present such of them as won its approval to the county commission, which, in its turn, and whenever necessary, would pass them on to the national commission for action."

In a letter to the Director of the United States Census, October 6, 1911, I said: "In my opinion the organization (like the Landwirtschaftsrat) should be semiofficial."

In proceeding with this presentation I purpose to bring out my meaning the more clearly by a series of illustrations, and I shall let you draw your own inferences from them. I do this because I realize that I am not here to instruct the men of the Senate and the men of the House. They can instruct me. I am here simply in the capacity of a reporter, just as a newspaper reporter might bring in a report of an event in the street. I will try to put the facts together, and you will draw the inferences, and perhaps the ideal aimed at will be discerned.

Here is the first illustration: Let a group of American farmers meet to discuss their economic conditions, and you may almost rest assured that "Wall Street" will be brought up; 'Wall Street," and its manipulating operators, and its deteriorating influences on the industry of agriculture. But let a group of German financial and commercial men meet, and we may be assured that the "Agrarpartei," the agrarian interests, will be denounced. "Wall Street is eating us up," will be the cry in the first case; in the second case it will be "the agrarian interests are eating us up." Thus we see that in the United States the power is centered in Wall Street, but in Germany the power is centered in the agrarian interest. Now the fact is that it would do no harm if the agricultural interest were to acquire in the United States a little of the power which it has in Germany. In fact, a good deal of this power would not hurt; we need as much of it as the farmers have in Germany, and that is quite a great deal.

And right here some one may ask: "Given a certain number of dollars in a country, what difference does it make to the economic life of that country whether those dollars are made to drift into the pockets of Johnson, who lives on Fifth Avenue, or of Thompson, who lives on a farm in Oklahoma? What difference does it make, so long as the same number of dollars are in the United States?"

It appears to me that it would make a great deal of difference. Causing the dollars to flow to Wall Street when they ought of right to go to the farmer does not merely injure the economic status of the farmer, but it injures likewise the economic status of the industry and commerce of the country. It diminishes land values; it unsettles securities; it has a disturbing influence on wages.

But can the full importance of this question be measured merely from the dollar point of view? What effect does it not have on the political status of this nation? When may we say that this nation is strong? When may we say that it is weak? A democracy may be said to be strong whenever there is an equipoise of power between the progressive element on the one hand and the conservative element on the other.

And right here is the value, the political value, of the farmer to the nation; the value of the farmer who owns his land, the farmer who makes a comfortable living. Such farmers are conservatives; it is their mode of thought and their environment which makes them so. Given a country with its due proportion of these conservatives, and you will find that country politically sound and strong. And this is the strength of Germany. Let us not deceive ourselves; her strength is not due to the "goose step" of her soldiers nor to her Krupp guns, but is primarily due to the fact that she has had sense enough to make of her farmers a conservative, status quo element, and this element is for her the real "power behind the throne."

That this is not overdrawn will be evident when we observe the operation of the Landwirtschaftsrat system in the scientific distribution of Germany's farm products. And what is this Landwirtschaftsrat? To my knowledge, the clearest and briefest explanation is that given by Dr. Dade, its secretary general:

"The German Empire is composed of 24 States. The largest of these is the Kingdom of Prussia, which is divided into 12 provinces. Each of these provinces is required by the Prussian law to elect a chamber of agriculture. The same system prevails in the other German States—all have their chambers of agriculture instituted under law. Each of these chambers of agriculture sends one or more delegates, proportionate to its importance, to the German Landwirtschaftsrat, which thus becomes the official council of agriculture for the whole of the German Empire."

The effect of this system on the distribution of farm products is shown by the following reply given by Dr. Johannsen, director of the Chamber of Agriculture of Hanover, to the question: "Are there any agricultural trusts in Germany?" He replied: "No; there are coal trusts, iron trusts, etc., but no agricultural trusts."

Speaking on the system, Baron Hermann von Schoen, of Munich, a member of the leading cooperative societies of Bavaria, said:

"The Imperial German Landwirtschaftsrat covers the whole of Germany; it is the semiofficial link connecting the official body, the Imperial Government, with the unofficial, with the people actually engaged in agriculture. It works from the top down and from the bottom up."

Thus we see from the above that the German has constructed for agriculture a wonderful organization, leading, like a pyramid, from the base, the land-owning farmer, up to the apex, the National Council, guiding and directing the farmer toward the best economic results.

Senator GORE. You would reverse the German plan. You would begin at the top and go to the bottom. By the voting proposition you might get a lot of radicals at the top. Do you see the point?

Mr. LUBIN. Yes; I see; the organization proposed for the American farmers under House joint resolution 344, the resolution before us, differs somewhat from the German system, which is an easy matter to understand. Under the resolution the national commission would be appointed by the President of the United States, and the State commissions would be appointed by each of the State governors. In the township and county commissions the elective principle should apply. The paying members of a township organization would elect their township commission; and the township commissions would each elect a delegate to the county commission. For the national commission the resolution provides for 15 able farmers in the front row and 14 able men who are not farmers behind them. Fourteen and fifteen make twenty-nine. The 14 men are to be experts in various lines; experts on carriage, like President Ripley, of the Santa Fe Railway; a financier of national reputation who knows all about money; an authority on interstate relations, like Mr. Franklin K. Lane, of California; a man familiar with the working of the parcel post, say, like Mr. Hitchcock; and the others should be experts on the laws of commerce, "captains of industry," men of national reputation. These would constitute the national commission appointed by the President and would form the apex of the pyramid. The next step, the next layer in the pyramid, would consist of a similar commission appointed in each State of the Union by the governors. The third step, the third layer in the pyramid, would consist of county commissions elected by the township commissions in each of the counties of a State; and the fourth and last step, the final layer in the pyramid, would be commissions elected in each township of the county by the paying members of the township organization.

Senator GORE. The national and State commissions would then be governmental agencies, and do you think that they would be exempt from undue political pressure?

Mr. LUBIN. There is a great deal in what you say, but inasmuch as all the people in the United States—the consumers and the producers—would be so closely interested in the personnel of these commissions, they would not be appointed overnight, and it would not be done in secret, and there would be a great deal of responsibility attaching to the Executive in the selection of each of the members. It must be conceded that members thus appointed would be likely to be better adapted to handle the complex and far-reaching issues and the technical details involved in the labors of the commissions than would be commissions composed solely of farmers.

Mr. KENT. These commissions would have the functions of bureaus of information?

Mr. LUBIN. Yes; that would be one of their main functions. Let me give some instances of the need for such work. While on a recent visit to Boston I went for a motor drive through the country. I saw some apples in a field and stopped the auto, and a lady who was with me got out and came back with a whole lot of them. They were very nice apples. I asked her whom I should pay, but she replied: "There is nothing to pay; we just take the apples for nothing. There is no sale for them; they are just lying there and will rot in the field." "But," I said, "are not apples wanted in Illinois or some other State or section? Are they not wanted in many parts of the United States?" My friend replied: "Well, all I know is that you can take all the apples you want, because there is no sale for them."

Again, I read in the Waco, Tex., paper of October 25 that thousands of pounds of fish and oysters are being dumped into Galveston Bay every week because the fishermen are unable to find a market for them.

The trouble right here, it seems to me, is not that the apples or the fish are not wanted, but rather that there is lack of marketing opportunities. As Senator FLETCHER has said:

"Products of the farm go to waste and bring nothing while hungry consumers would gladly pay prices running into millions for them if there was a way of getting these to markets so that a product which has no value where it is might be placed where it has excellent value, to the benefit of all concerned."

What would be done in cases such as those described were the system provided for under resolution 344 in operation? This: The farmer in that township would communicate with the county commission on the subject of the distribution of his apples. The county commission may have received many similar inquiries. It either will have the requisite information itself, in which case it will reply direct to the township commissions, or it will classify and assemble the inquiries received and transmit them to the State commission. If this State commission has the information, it will reply; if not, in its turn it will assemble and classify the inquiries received and will send them on to the national commission, whose field of operation will embrace both the home and foreign markets. As a result of all this, the apples will be disposed of to the best possible advantage.

Another incident: While in California a few weeks ago I called on a prominent fruit grower, Mr. Towne, of Lodi, a relative of the late A. N. Towne, who used to occupy an important position in the Southern Pacific Railroad. I asked him, "How is business?" and he replied, "All right, so far as production is concerned. I am producing more to the acre than ever before." I then asked: "How about distribution?" "Well," he said, "there is where the mischief comes in. We used to get $20 to $25 a ton for wine grapes, and now prices have been forced down to $10, then to $8, and now they stand at $7.50 a ton (the average price for similar grapes in Italy is $30 a ton). This is below the cost of production." "What are you going to do about it?" I inquired, and he replied, "We propose to organize." "But who is 'we'?" I asked. "Oh, us fellows in and around Lodi."

Now, then, let us suppose that these fruit growers do organize; what would be the result? What but traveling toward a cul-de-sac? The fruit growers of Lodi would be as powerless to reach out to their best possible markets as a pedestrian would be to reach his destination by walking down a street which ended in a blank wall. There is but

one way out of such a cul-de-sac—the adoption of the German Landwirtschaftsrat system or its substitute as proposed under the pending resolution. Under the proposed system the man in a remote township in any State in the Union would be able to reach through the county, the State, and the National commissions the best possible markets within the United States or the remotest markets of the world.

Are arguments required to prove the need of boards of trade, chambers of commerce, clearing houses, and commercial travelers so far as the needs of commerce are concerned? Could commerce be conducted successfully in our age without these aids? And yet the business of farming in the United States has no such facilities. As a result, in place of proceeding along on rational, normal lines, agriculture is compelled to halt, hobble, and stumble along in any manner that fortuity or designing manipulations may permit, all at the expense of the producer and the consumer. The defect here pointed out was perceived in Germany and remedied there by the Landwirtschaftsrat system. Such a system is as necessary for the United States as it is for Germany.

Speaking on this head, Senator FLETCHER has said—

"This is the great unsolved problem in this country, and until it is solved there will be waste, unprofitable labor, and high-living cost. A commission of experienced, public-spirited men, experts in the various lines involved, in all the elements of proper marketing, with some authority and power behind them, could accomplish results vastly beneficial to all our people."

Fortunately a precedent on a small scale may be offered which tends to illustrate the practicability of the proposal before us. The precedent that I refer to is that afforded by the Citrus Protective League of California. In a conference held at Los Angeles with Mr. G. Harold Powell, manager of the league, he informed me that 20 years ago the growers produced about 5,000 carloads of fruit which they sold, as most farm crops are sold now, to local buyers, to representatives of distant firms, or by consigning it on commission to markets from 1,500 to 3,000 miles away, the only return in this latter case frequently being bills for freight and selling charges. Mr. Powell then went on to state:

"Sometimes the local buyers divided the territory between them and did not compete with each other, and sometimes they fixed a maximum price to be paid for the fruit."

Continuing on, he said—

"Under either of these systems of suppressed competition, the growers became helpless. These were known as the 'red ink' days in the California citrus industry (the red ink being a sign of loss). With 5,000 carloads of fruit to market annually, the growers thought that overproduction stared them in the face, and the stability of the industry was questioned. The real trouble, however, came through bad distribution."

To rectify this state of affairs, the Citrus Protective League was founded, and with astonishingly gratifying results. Where before there was hazard, difficulty, and oftentimes loss in disposing of 5,000 carloads of fruit annually, the growers now handle 45,000 carloads to the best economic advantage. In substance, what this league is to the citrus growers of California, the system proposed under resolution 344 is intended to be to the farmers of the United States.

"Well," it may be said, "since the league takes the place of the landwirtschaftsrat for the citrus growers, would not similar leagues for the other farm interests take the place of the system set forth under the proposed resolution?"

Let us see: Mr. Powell informs me that it costs $75,000 a year for the maintenance of his league. This is an enormous sum, yet the products of the citrus growers are confined to a very limited area. It would obviously cost a very much greater sum to run similar leagues for the other farm products which cover so much wider areas of production, such as cereals, potatoes, live stock, hay, apples, dairy and truck farm products, poultry, etc. It would therefore seem evident that as a means toward economic distribution, the formation of such leagues for each of the multitudinous interests of agriculture would, from a practical point of view, be inadequate. Besides, the citrus growers' league, even under its great expense and with the restricted area under production, is, nevertheless, at present limited as to the quantity and quality of the information which this expenditure can procure for it. Under the system proposed in the resolution before us, this same league would be in a position to obtain a very much wider range of the information it should have. For observe, at the present time the league is under expense for each and every link in its chain of information, whereas, under the proposed system, it would only be assessed for its proportion of the clerical expenses of its township, county, and State commissions and for the national commission, and in return for this it would be afforded authoritative information from every township, county, and State in the United States and from foreign markets all over the world; and all this at a very much lower rate of expenditure than it incurs at the present time.

Mr. KENT. I think it would be well if you could give us a description of what these commissions would do after they were appointed. If I understand, their function would be to supervise distribution?

Mr. LUBIN. The commissions would organize and adopt their by-laws. They would then employ the necessary clerical force, and start to work. This clerical force should receive preliminary training in the technique of its duties from experts, for instance, of the telegraph and telephone companies, from the Dun and Bradstreet mercantile agencies, and from others competent to instruct it in the details of its proposed duties. Thus equipped, the commissions would be ready to ask and give information along the lines of the proposed work.

And now it will be well to bring forward a question that has been asked as to the practicability of the system proposed under the resolution before us: "Could the national commission technically familiarize itself with all the varieties, qualities, and quantities of the vast number of farm products of the United States? Could it undertake to handle, to sell them successfully?"

Right here let me state once for all that there is no more need of technical knowledge of this kind on the part of the commissions proposed under resolution 344 than there is of such knowledge on the part of the German Landwirtschaftsrat. The commissions would do no selling; they would supply information which should enable the distribution of the products to be conducted to economic advantage, they would point out to the farmers where, when, and how they should sell, and where, when, and how they should not sell. They would serve as the great clearing houses of information along practical, economic lines, and their work could, of course, be made use of by all the producers, and by such buying and selling cooperative associations of the farmers as may wish to avail themselves of it.

Mr. GOODWIN. I will ask a question. The Secretary of Agriculture reports on this matter that he considers the proposal as premature, because the department has undertaken, through its Bureau of Markets, to solve this problem and is proceeding with it. Have you anything to suggest to us as to the limitations of the department that might interfere with its working this thing out itself?

Mr. LUBIN. That depends on just what is intended to be conveyed by the words "working this thing out itself." If the Secretary means that his department is paving the way toward a scientific system of distribution by the farmers, then in so far as it is doing this effectively it is certainly doing good work. But if the words "working this thing out itself" are to convey the meaning that the Department of Agriculture intends to do the work contemplated under resolution 344, the work of the scientific distribution of farm products in the United States, then I certainly do see "limitations" which would interfere with its performing this task.

I am strongly inclined to the belief that the Secretary holds this very same opinion, for how could the Government step in and tell the farmers "you must not sell to these people; you must sell to those people"? Hitherto the Department of Agriculture has confined itself almost exclusively to the problems of production, and it is to the credit of the present Secretary that he has taken up the problems of distribution. Having done so, I am hopeful that on due consideration he will see his way clear to favor the proposal before us. The work of the department, through its Bureau of Markets, and the work of the commissions would not clash; on the contrary, each would complete the other. The commissions would supply the effective channel through which the information gathered by the department could be made of practical economic value to the American people.
